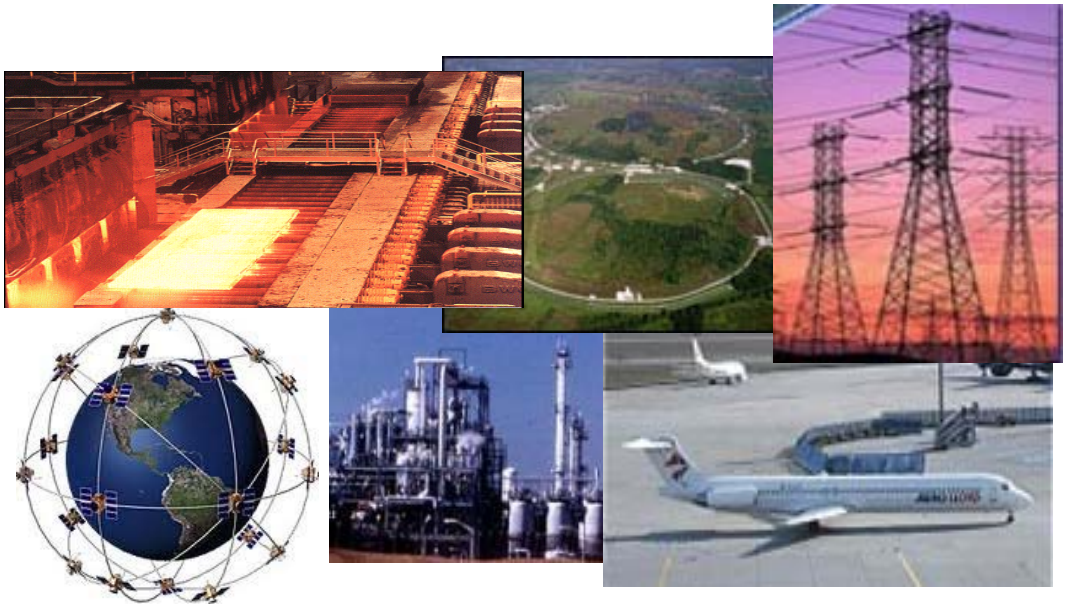
Evolution in DRE Systems

The Past

Standalone real-time & embedded systems
- Stringent quality of service (QoS) demands
  - e.g., latency, jitter, footprint
- Resource constrained

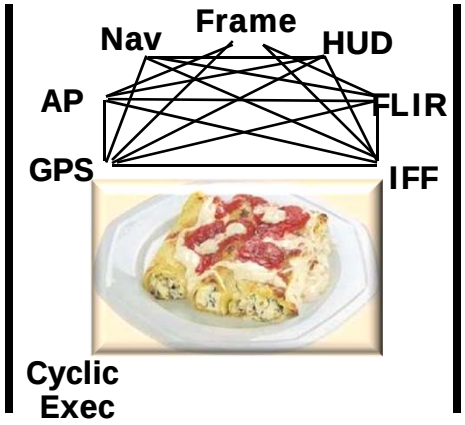
The Present

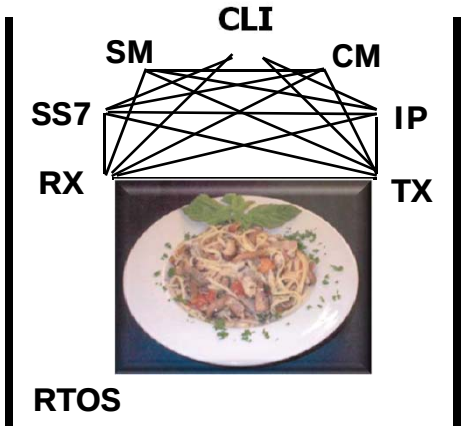


Distributed real-time & embedded (DRE) systems
- Net-centric systems-of-systems
- Stringent simultaneous QoS demands
  - e.g., dependability, security, scalability, etc.
- More fluid environments & requirements

This talk focuses on technologies & methods for enhancing DRE system QoS, producibility, & quality

Evolution of DRE Systems Development





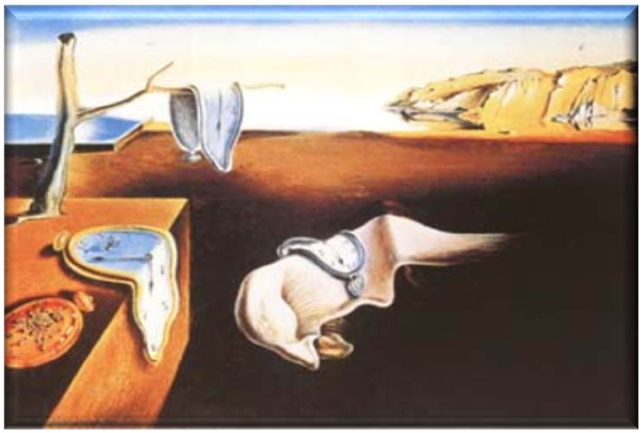
Technology Problems

- Legacy DRE systems are often:
  - Stovepiped
  - Proprietary
  - Brittle & non-adaptive
  - Expensive
  - Vulnerable

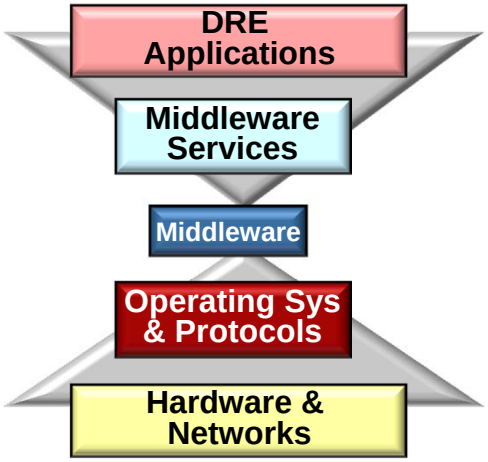
Mission-critical DRE systems have historically been built directly atop hardware, which is

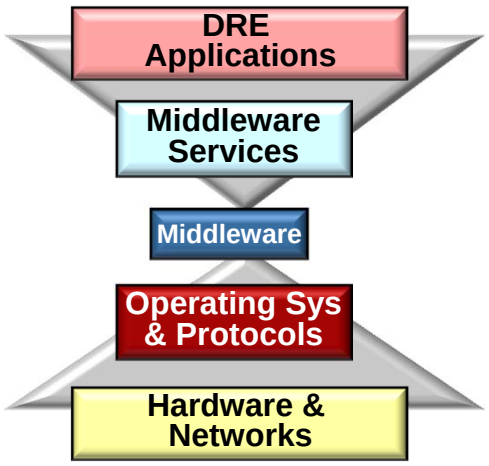
- Tedious
- Error-prone
- Costly over lifecycles

Consequence: Small changes to legacy software often have big (negative) impact on DRE system QoS & producibility



Evolution of DRE Systems Development





Technology Problems

- Legacy DRE systems are often:
  - Stovepiped
  - Proproprietary
  - Brittle & non-adaptive
  - Expensive
  - Vulnerable

Mission-critical DRE systems have historically been built directly atop hardware, which is

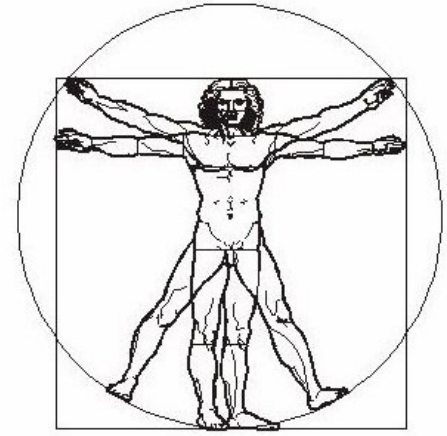
- Tedious
- Error-prone
- Costly over lifecycles

What we need are the means to

- Enhance integrated DRE system capability at lower cost over the lifecycle & across the enterprise
- Reduce cycle time of developing & inserting new technologies into DRE systems

What's So Hard About DRE Software?

Human Nature



- Organizational impediments
- Economic impediments
- Administrative impediments
- Political impediments
- Psychological impediments

Technical Complexities

Accidental Complexities

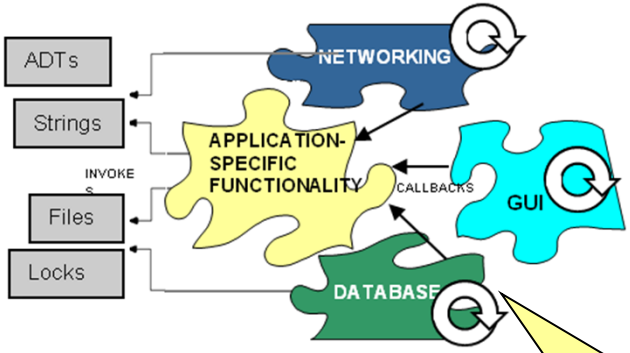
- Low-level APIs & debug tools
- Algorithmic decomposition

Inherent Complexities

- Quality attributes
- Causal ordering
- Scheduling & synchronization
- Deadlock avoidance
- ...

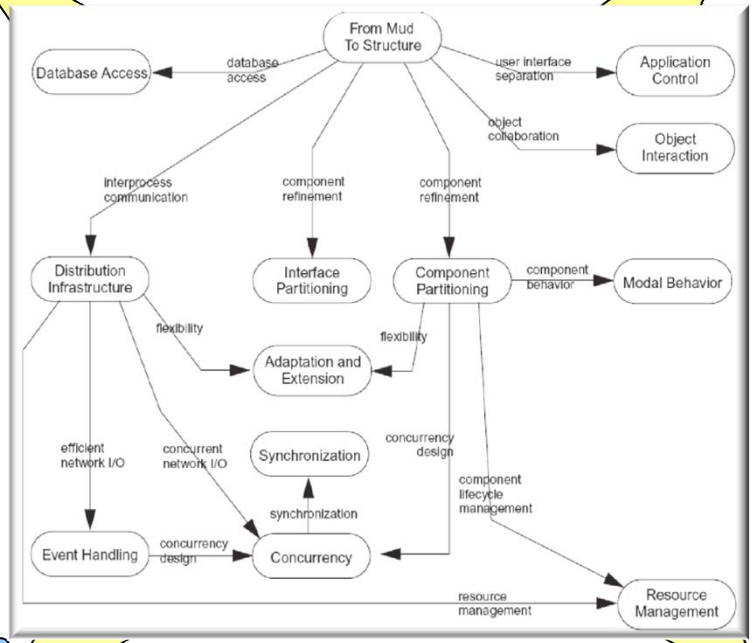
www.dre.vanderbilt.edu/~schmidt/reuse-lessons.html

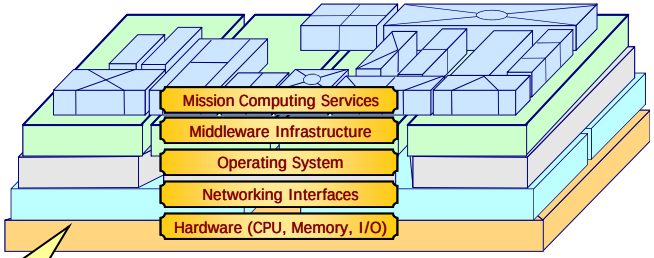
Systematic Reuse Capabilities for DRE Systems



Frameworks

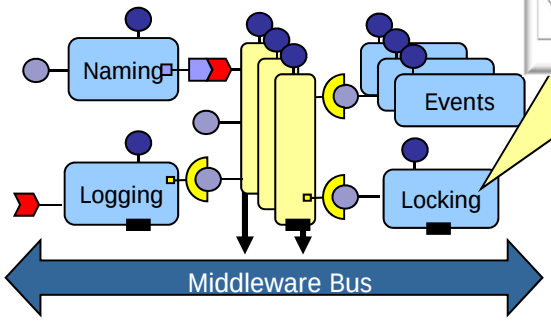
Patterns & Pattern Languages



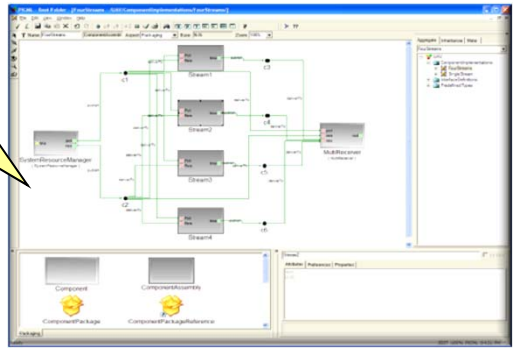


Software Product-lines

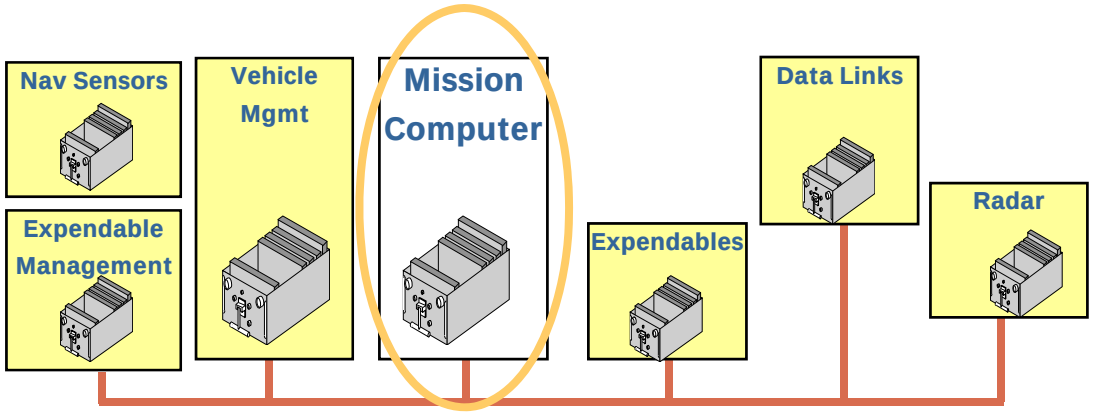
Component-based & Service-Oriented Middleware



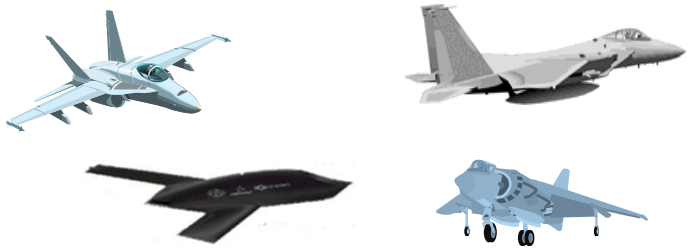
Model-Driven Engineering Tools



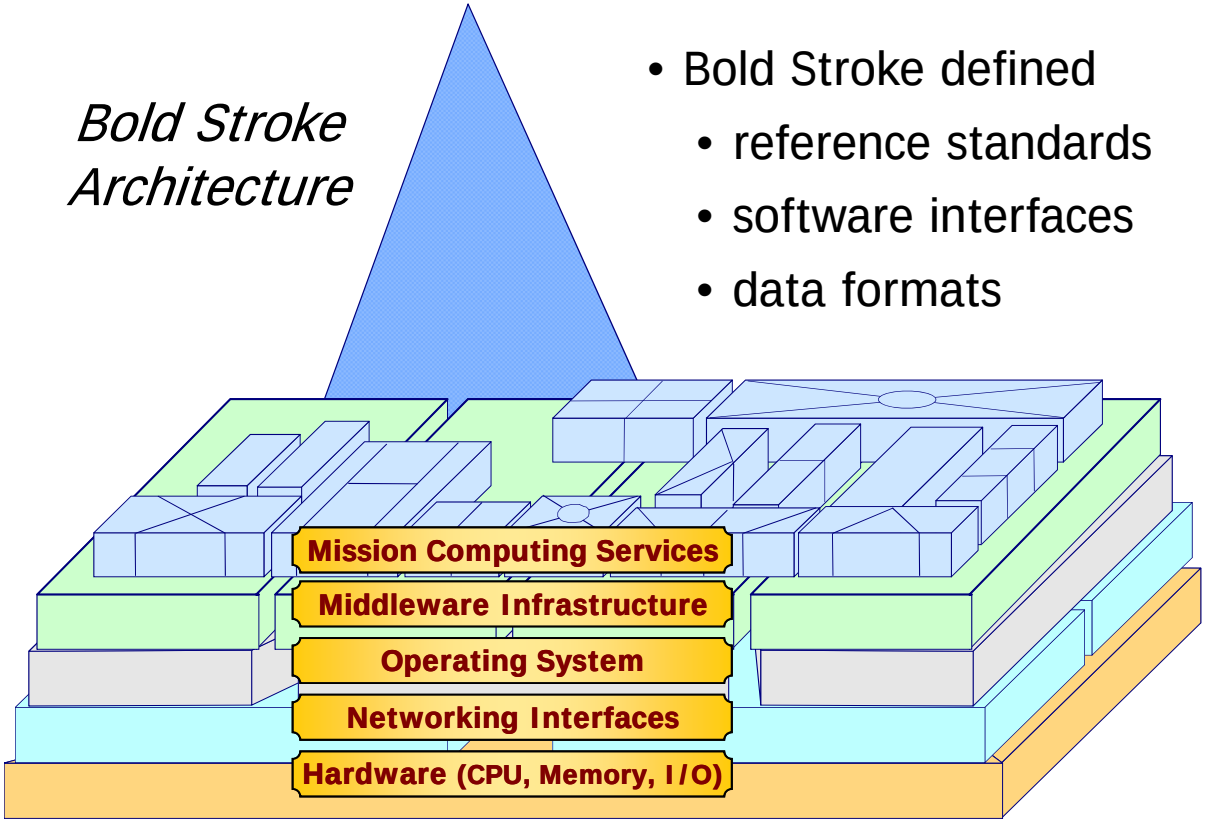
DRE System Case Study: Boeing Bold Stroke



- Systematic reuse platform for Boeing avionics mission computing



Bold Stroke Architecture

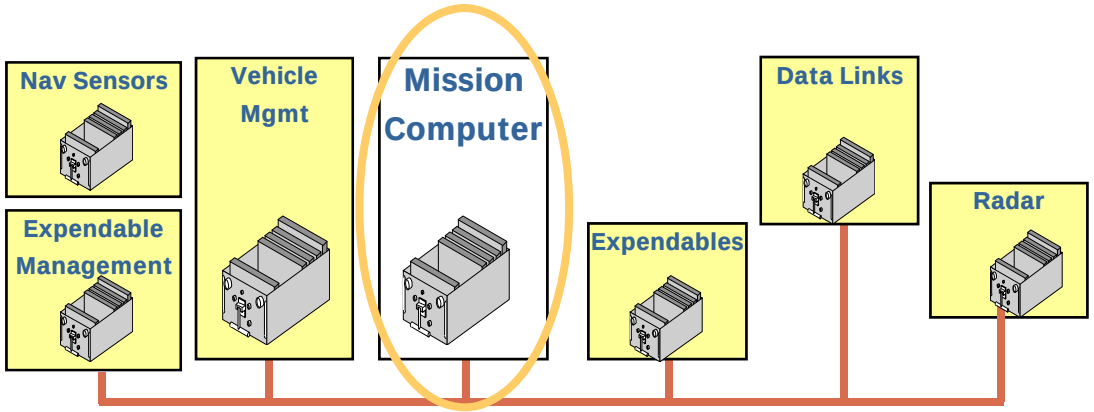


- Bold Stroke defined
  - reference standards
  - software interfaces
  - data formats
  - protocols
  - system services &
  - reusable components

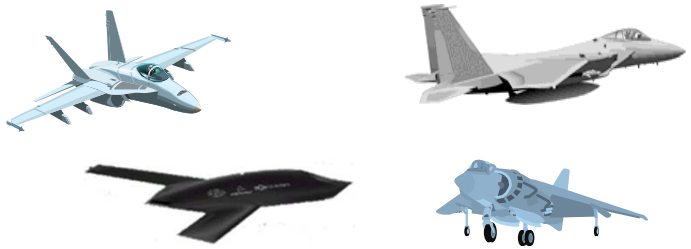
  that enabled distributed computing & allowed distributed applications to coordinate, communicate, execute tasks, & respond to events in an integrated & dependable manner

splc.net/fame/boeing.html

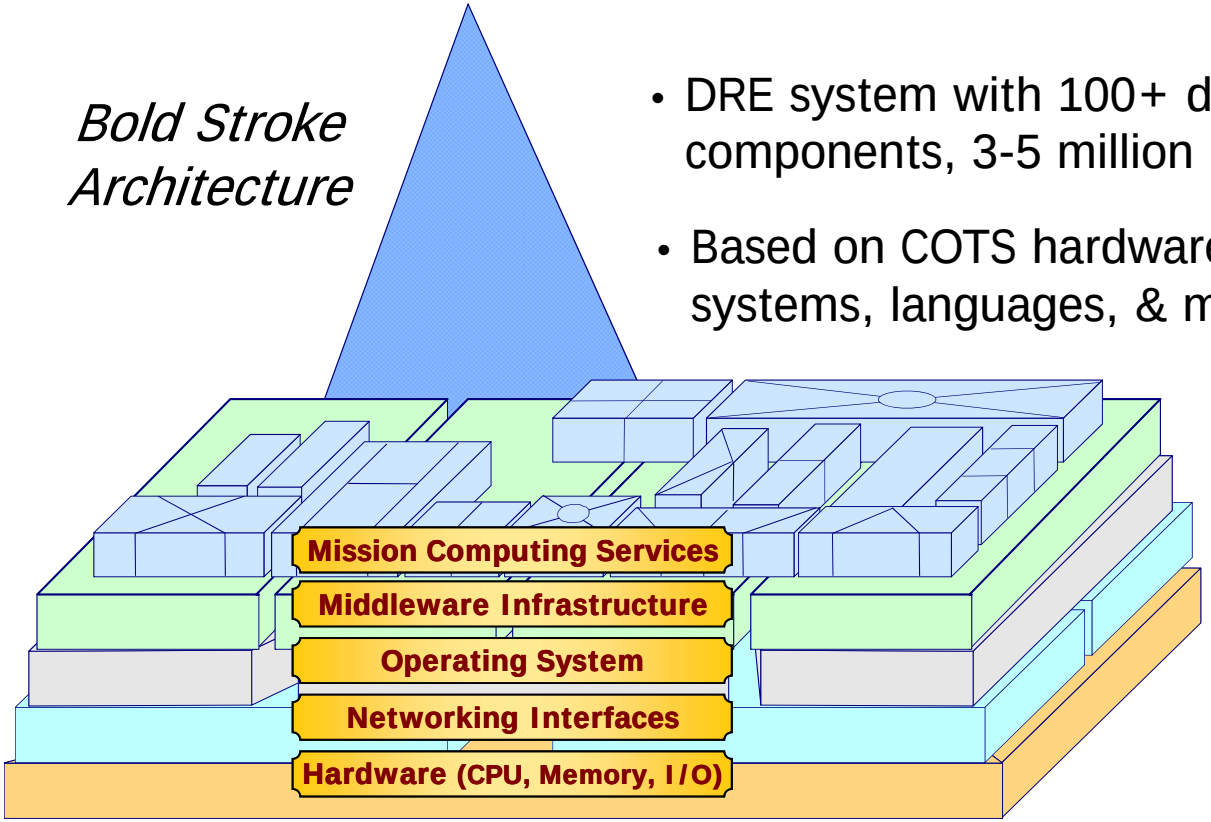
DRE System Case Study: Boeing Bold Stroke



- Systematic reuse platform for Boeing avionics mission computing



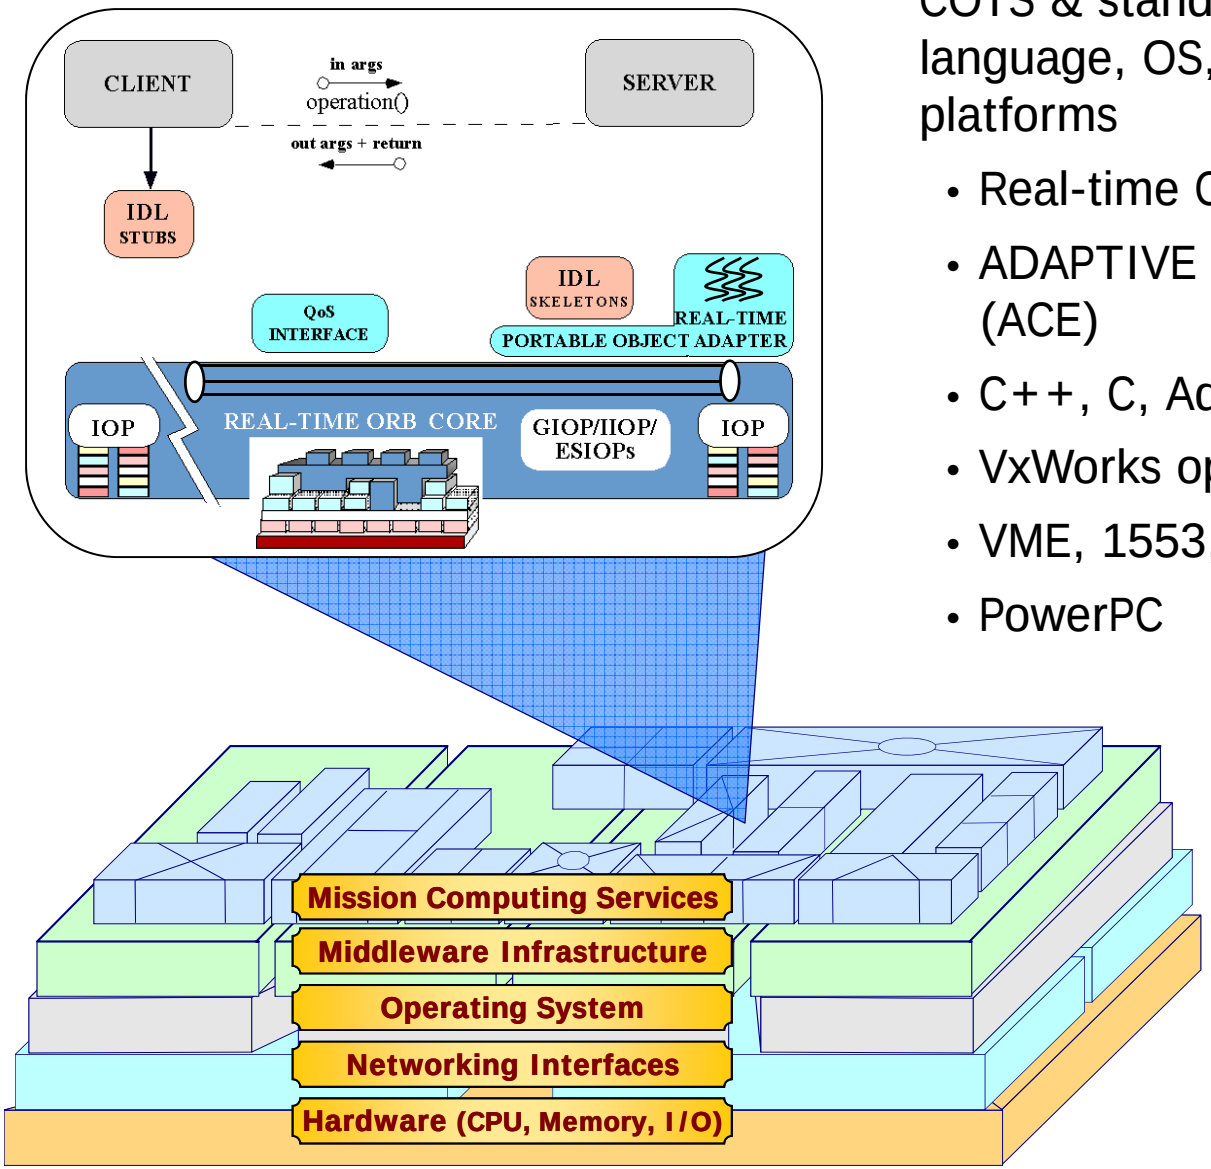
Bold Stroke Architecture



- DRE system with 100+ developers, 3,000+ software components, 3-5 million lines of C++/C/Ada/Java
- Based on COTS hardware, networks, operating systems, languages, & middleware
- Used as an Open Experimentation platform (OEP) for DARPA PCES, MoBIES, SEC, NEST, & MICA programs

splc.net/fame/boeing.html

Applying COTS to Bold Stroke



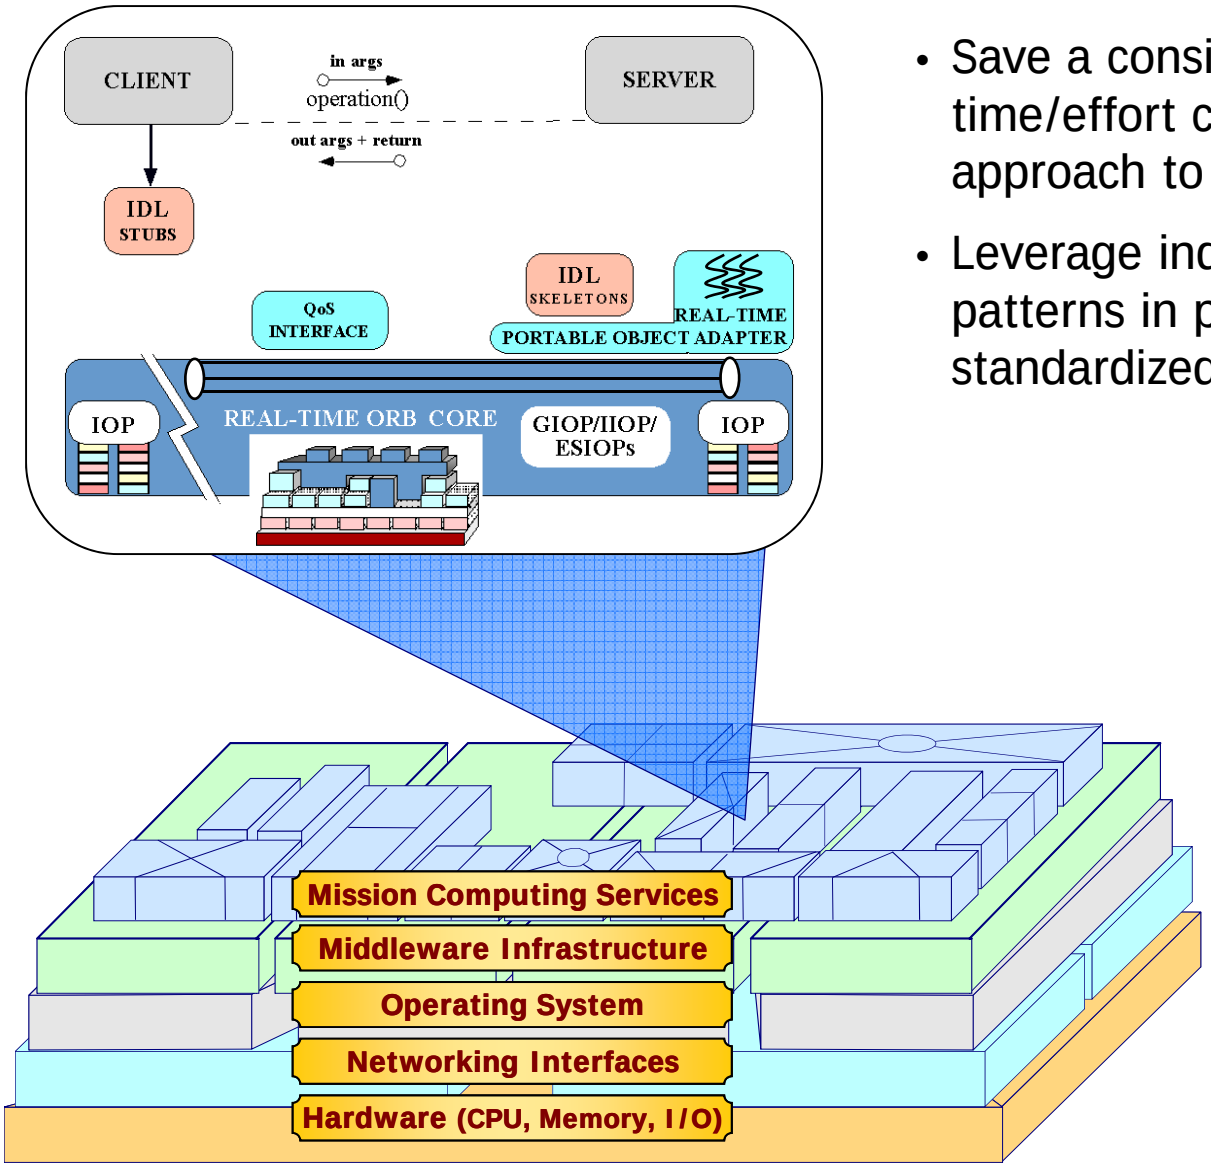
COTS & standards-based middleware, language, OS, network, & hardware platforms

- Real-time CORBA (TAO) middleware
- ADAPTIVE Communication Environment (ACE)
- C++, C, Ada, & Real-time Java
- VxWorks operating system
- VME, 1553, & Link16
- PowerPC

www.dre.vanderbilt.edu/ACE

www.dre.vanderbilt.edu/TAO

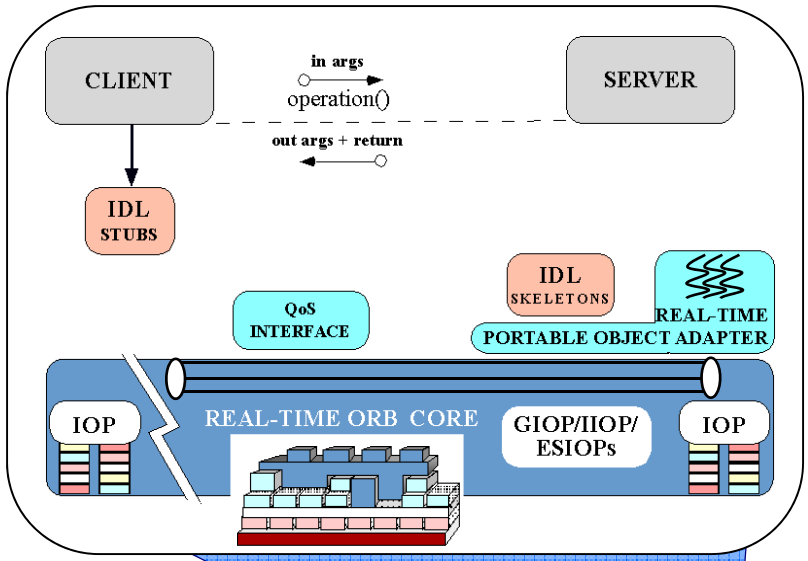
Benefits of Using COTS

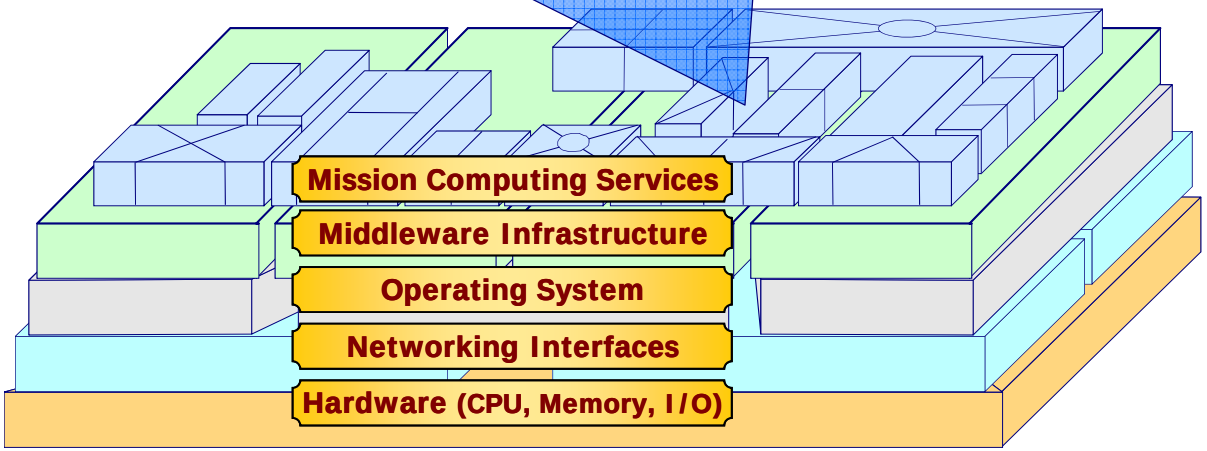


- Save a considerable amount of time/effort compared with traditional approach to handcrafting capabilities
- Leverage industry "best practices" & patterns in pre-packaged (& ideally) standardized form

The use of COTS is essentially "outsourcing," with many of the associated pros & cons

Limitations of Using COTS



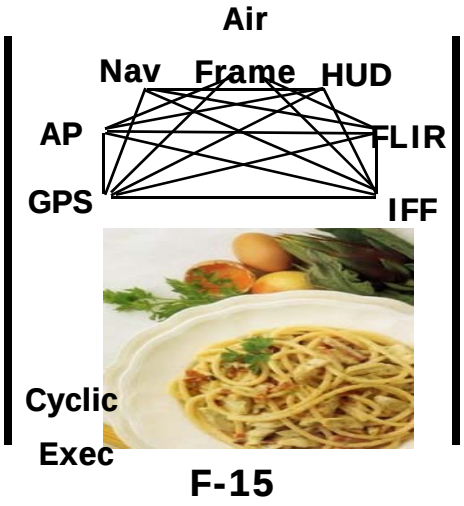


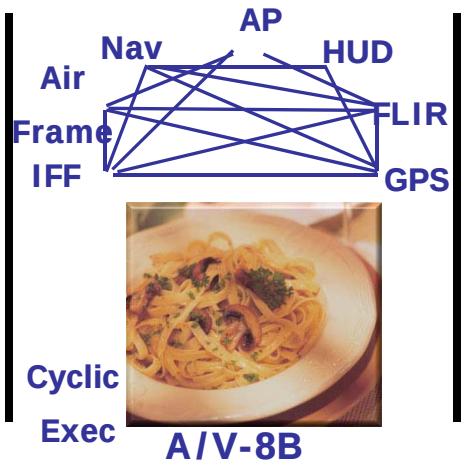
- QoS of COTS components is not always suitable for mission-critical DRE systems

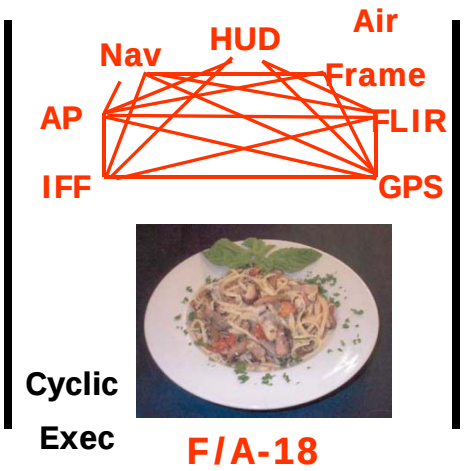
- COTS technologies address some, *but by no means all*, domain-specific challenges associated with developing mission-critical DRE systems

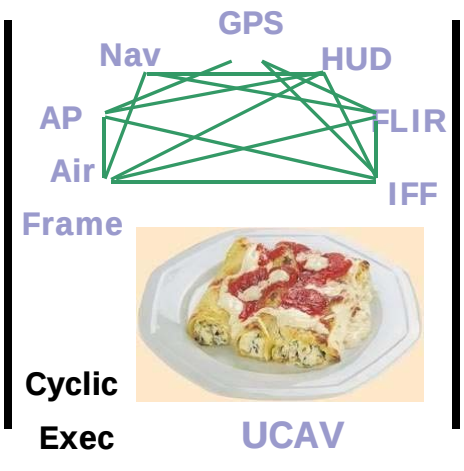
What was needed was a systematic reuse technology for organizing & automating key roles & responsibilities in an application domain

Motivation for Software Product-lines (SPLs)







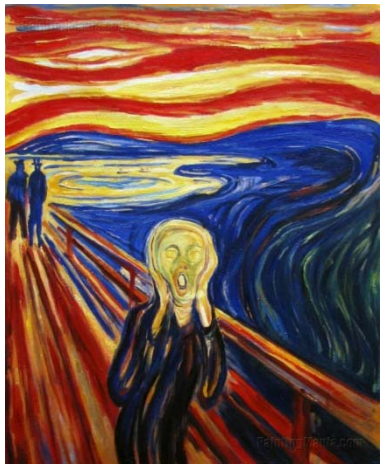


Legacy avionics mission computing systems are:

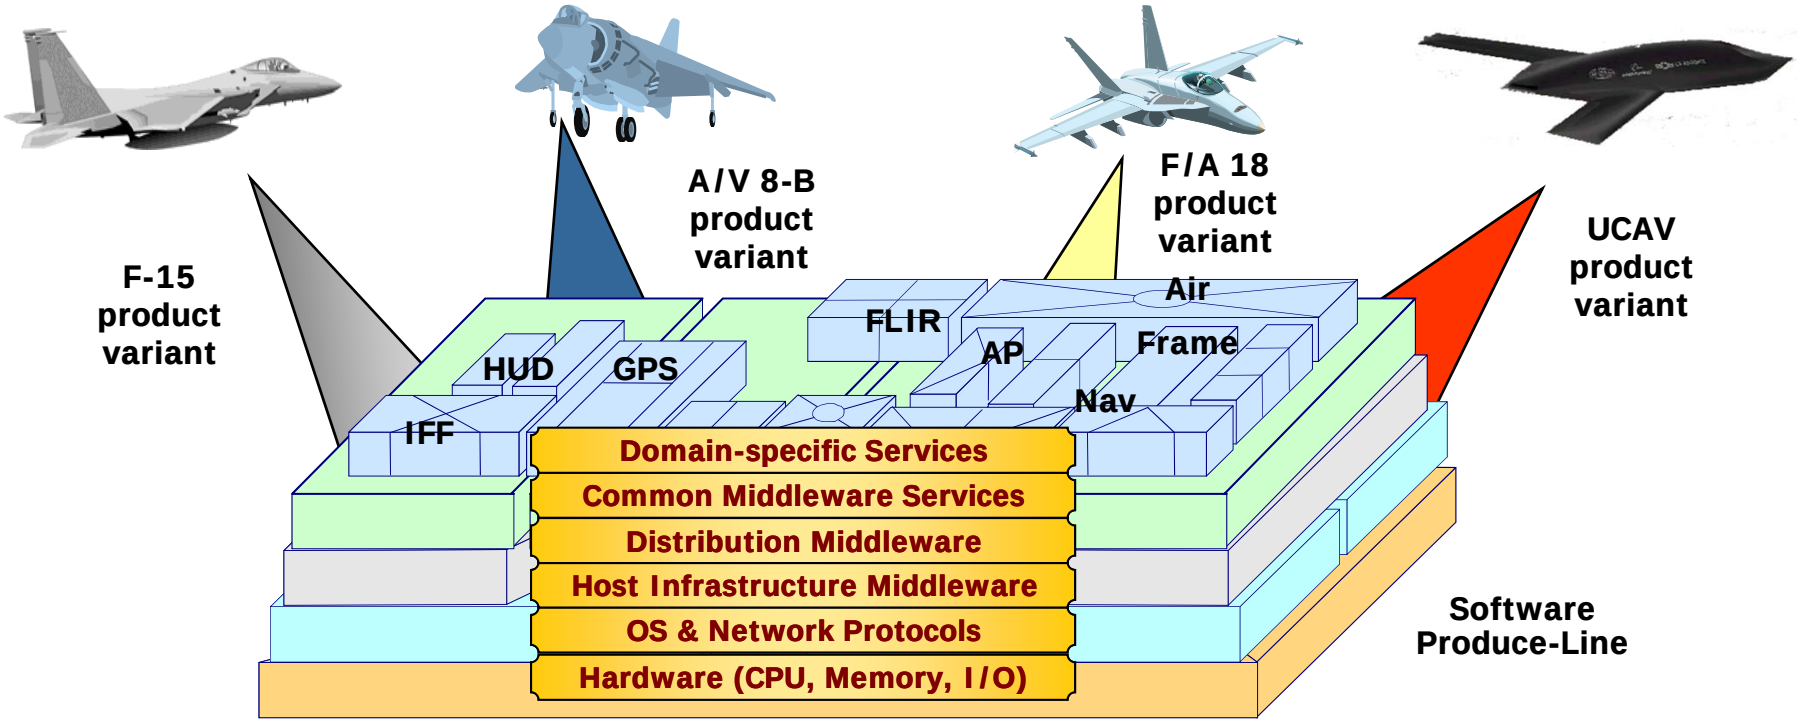
- Stovepiped
- Proprietary
- Brittle & non-adaptive
- Expensive
- Vulnerable

Consequences:

- Small changes to requirements & environments can break nearly anything
- Lack of any resource can break nearly everything



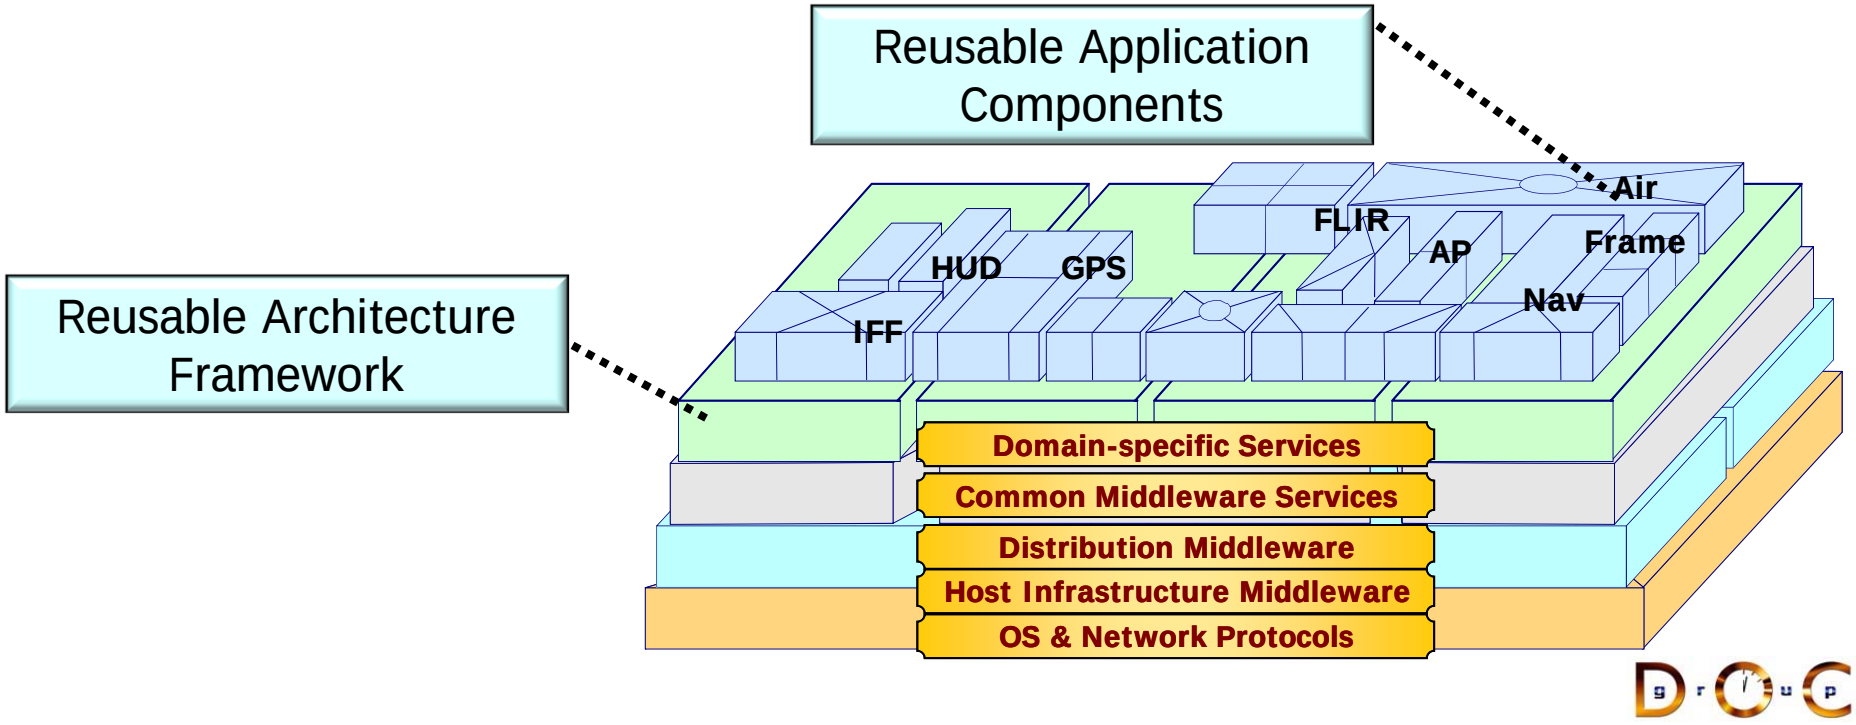
Motivation for Software Product-lines (SPLs)



- SPLs factor out general-purpose & domain-specific services from traditional application responsibility in DRE systems
- Manage software variation while reusing large amounts of code that implement common features within a particular domain
- SPLs offer many opportunities to configure product variants
  - e.g., component distribution & deployment, user interfaces & operating systems, algorithms & data structures, etc.

Overview of Software Product-lines (SPLs)

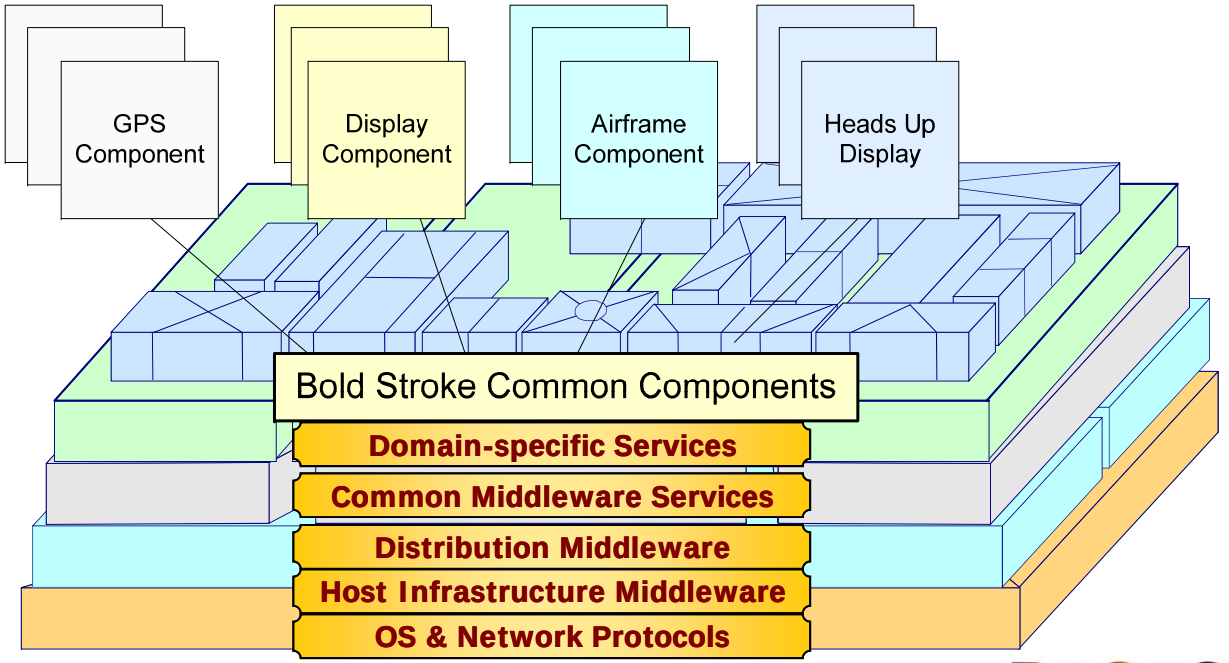
- SPL characteristics are captured via *Scope, Commonalities, & Variabilities (SCV) analysis*
  - This process can be applied to identify commonalities & variabilities in a domain to guide development of a SPL
- Applying SCV to Bold Stroke
  - Scope defines the domain & context of the SPL
    - e.g., Bold Stroke component architecture, object-oriented application frameworks, & associated components (GPS, Airframe, & Display)



Applying SCV to the Bold Stroke SPL

Commonalities describe the attributes that are common across all members of the SPL family

- Common object-oriented frameworks & set of component types
  - e.g., GPS, Airframe, Navigation, & Display components
- Common middleware infrastructure
- e.g., Real-time CORBA & Lightweight CORBA Component Model (CCM) variant called Prism

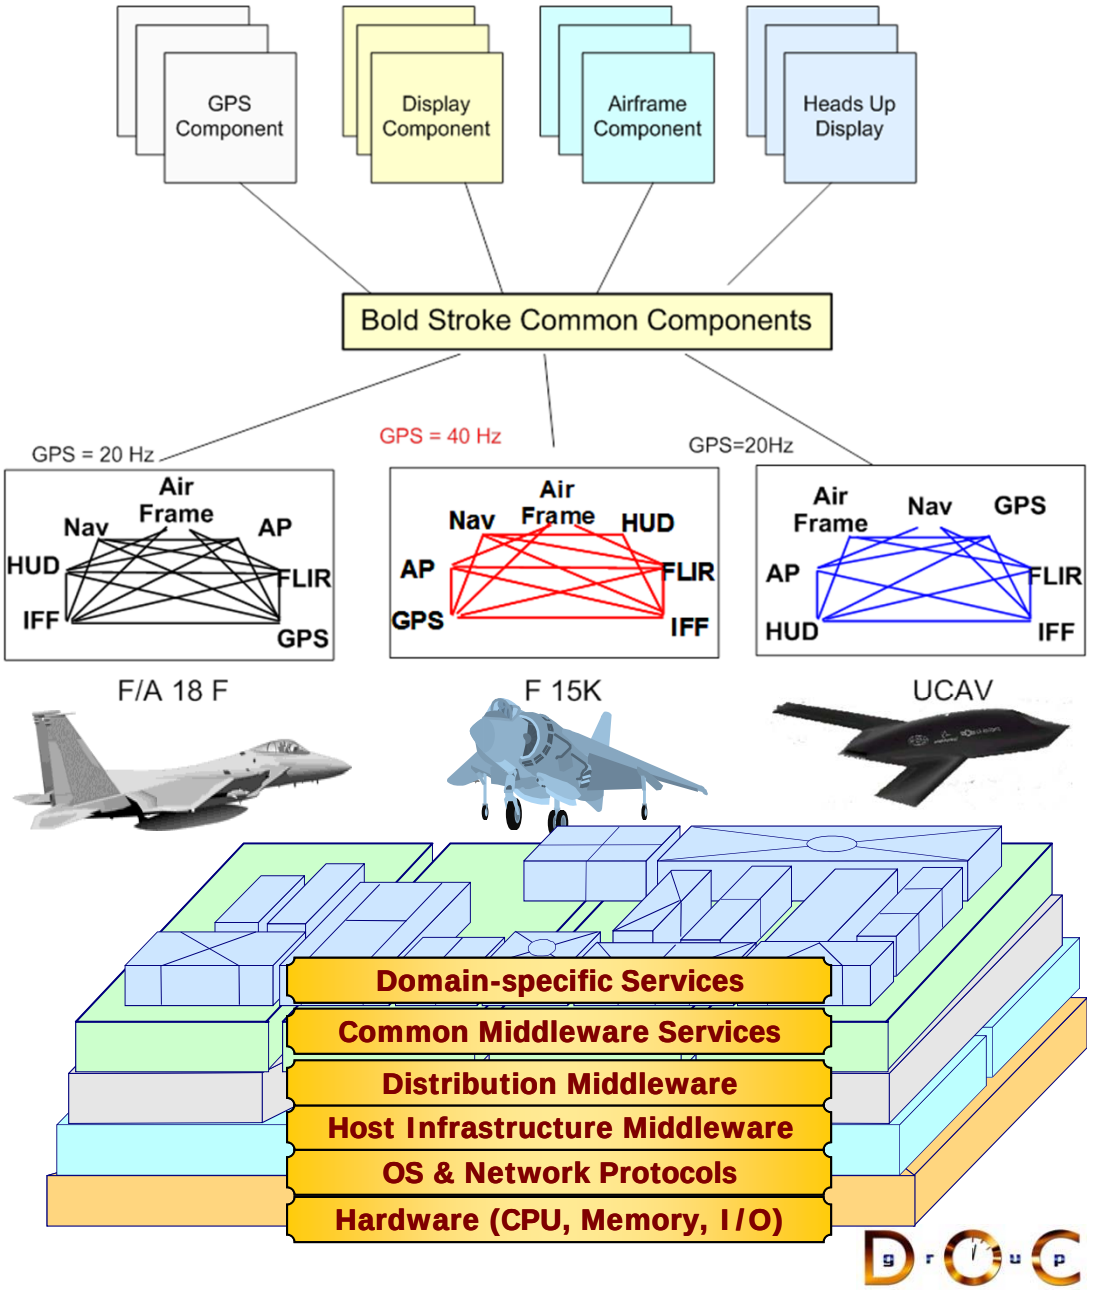


Applying SCV to the Bold Stroke SPL

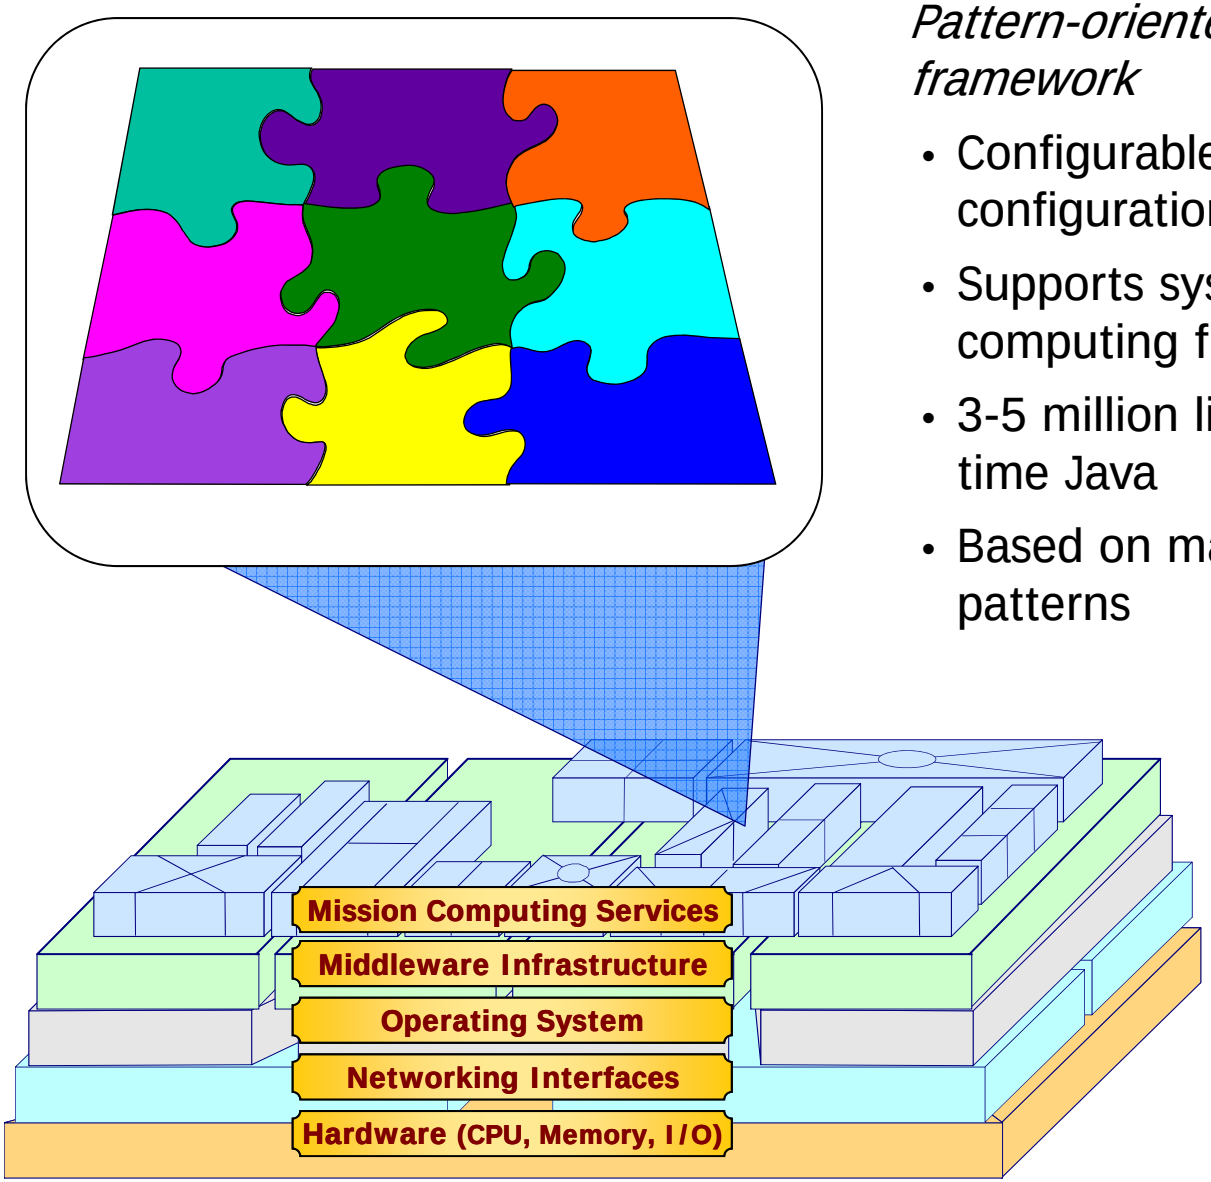
Variabilities describe the attributes unique to the different members of the family

- Product-dependent component implementations (GPS/INS)
- Product-dependent component connections
- Product-dependent component assemblies
  - e.g., different packages for different customers & countries
- Different hardware, OS, & network/bus configurations

Patterns & *frameworks* are essential for developing reusable SPLs



Applying Patterns & Frameworks to Bold Stroke



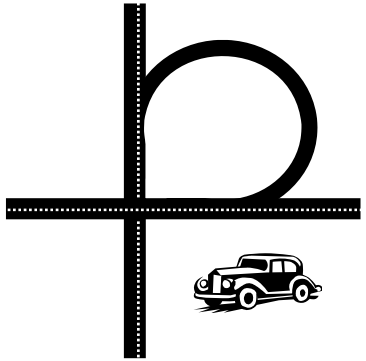
Pattern-oriented domain-specific application framework

- Configurable to variable infrastructure configurations
- Supports systematic reuse of mission computing functionality
- 3-5 million lines of C++, C, Ada, & Real-time Java
- Based on many architecture & design patterns

Patterns & frameworks are also used throughout Bold Stroke COTS software infrastructure

Overview of Patterns

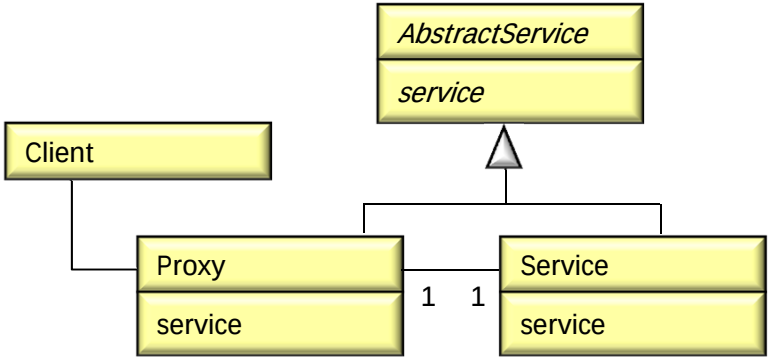
- Present *solutions* to common software *problems* arising within a particular *context*



- Help resolve key software design forces

- *Flexibility*
- *Extensibility*
- *Dependability*
- *Predictability*
- *Scalability*
- *Efficiency*

- Capture recurring structures & dynamics among software participants to facilitate reuse of successful designs



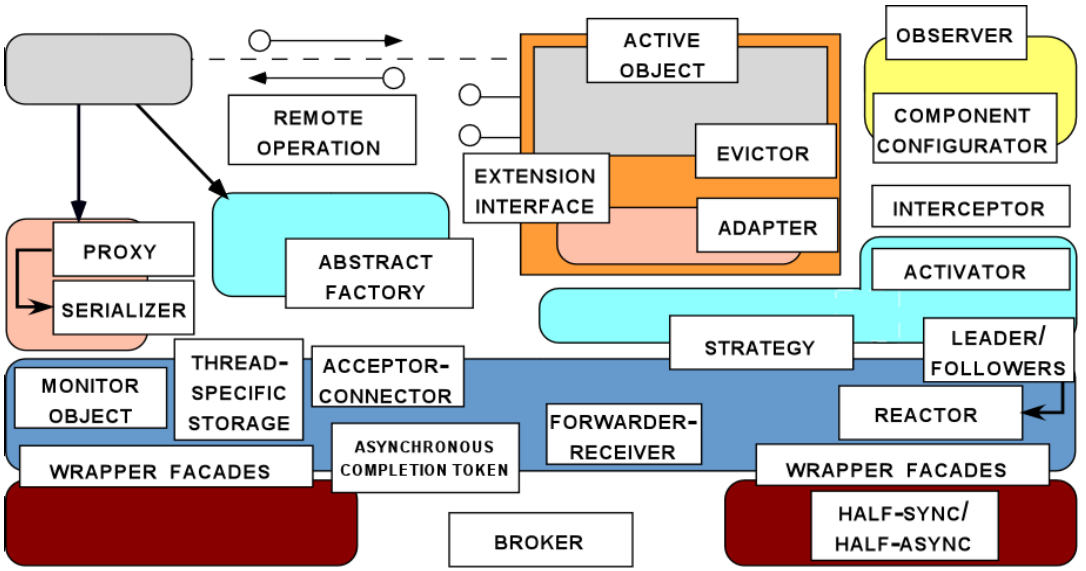
The Proxy Pattern

- Codify expert knowledge of design strategies, constraints, & best practices

Overview of Pattern Languages

Motivation

- Individual patterns & pattern catalogs are insufficient
- Software modeling methods & tools largely just illustrate *what/how* – not *why* – systems are designed



Benefits of Pattern Languages

- Define a *vocabulary* for talking about software development problems
- Provide a *process* for the orderly resolution of these problems
- Help to generate & reuse software *architectures*

Legacy Avionics Architectures

Key system characteristics

- Hard & soft real-time deadlines
  - ~20-40 Hz
- Low latency & jitter between boards
  - ~100 *u*secs
- Periodic & aperiodic processing
- Complex dependencies
- Continuous platform upgrades

Avionics Mission Computing Functions

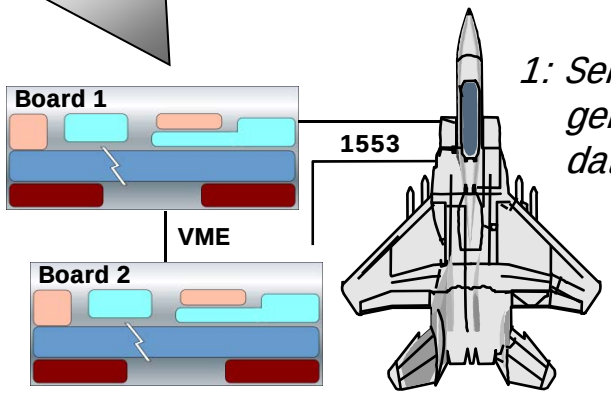
- Weapons targeting systems (WTS)
- Airframe & navigation (Nav)
- Sensor control (GPS, IFF, FLIR)
- Heads-up disSPLy (HUD)
- Auto-pilot (AP)

4: Mission functions perform avionics operations

3: Sensor proxies process data & pass to missions functions

2: I/O via interrupts

1: Sensors generate data



Legacy Avionics Architectures

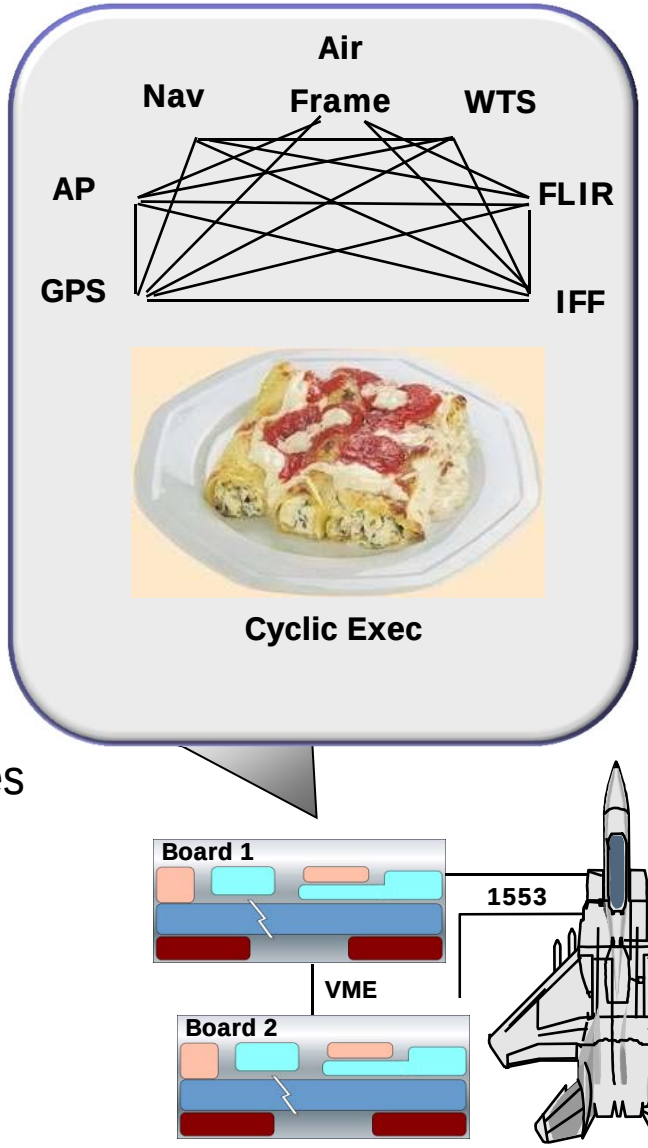
Key system characteristics

- Hard & soft real-time deadlines
  - ~20-40 Hz
- Low latency & jitter between boards
  - ~100 *u*secs
- Periodic & aperiodic processing
- Complex dependencies
- Continuous platform upgrades

Limitations with legacy avionics architectures

- Stovepiped
- Proprietary
- Expensive
- Vulnerable

- *Tightly coupled*
- *Hard to schedule*
- *Brittle & non-adaptive*



4: Mission functions perform avionics operations

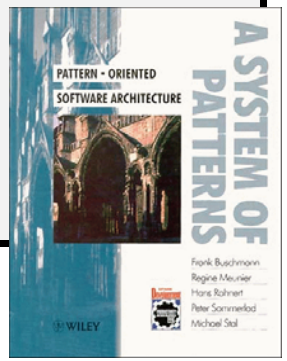
3: Sensor proxies process data & pass to missions functions

2: I/O via interrupts

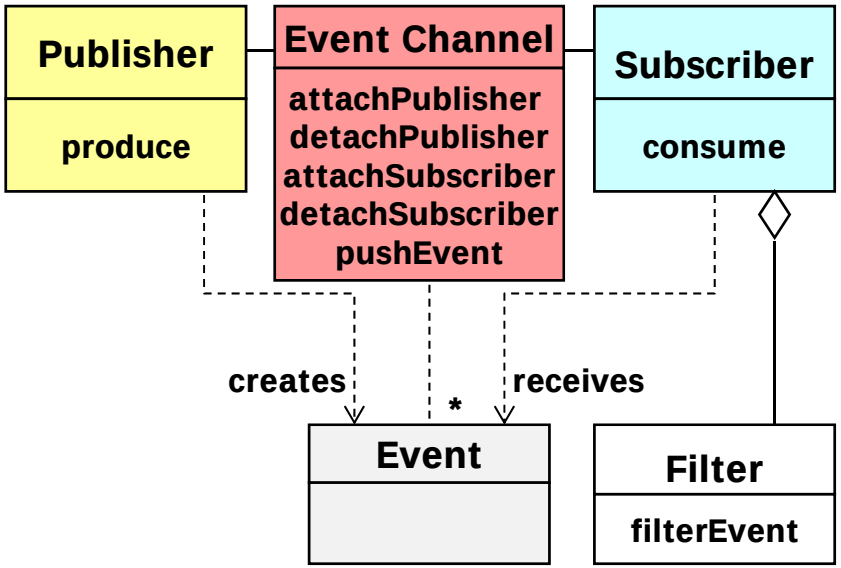
1: Sensors generate data

Decoupling Avionics Components

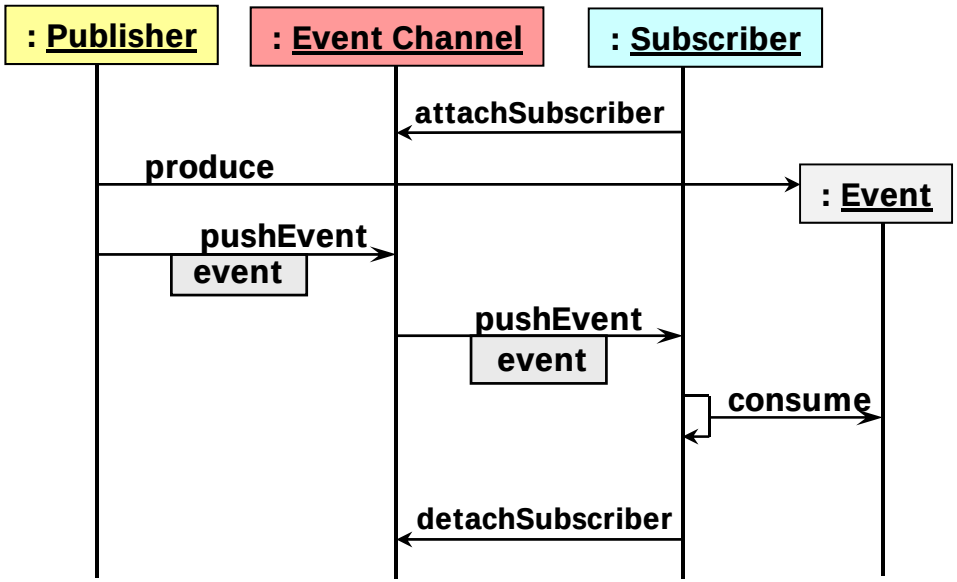
Context	Problems	Solution
• I/O driven DRE application • Complex dependencies • Real-time constraints	• Tightly coupled components • Hard to schedule • Expensive to evolve	• Apply the *Publisher-Subscriber* architectural pattern to distribute periodic, I/O-driven data from a single point source to a collection consumers



Structure



Dynamics



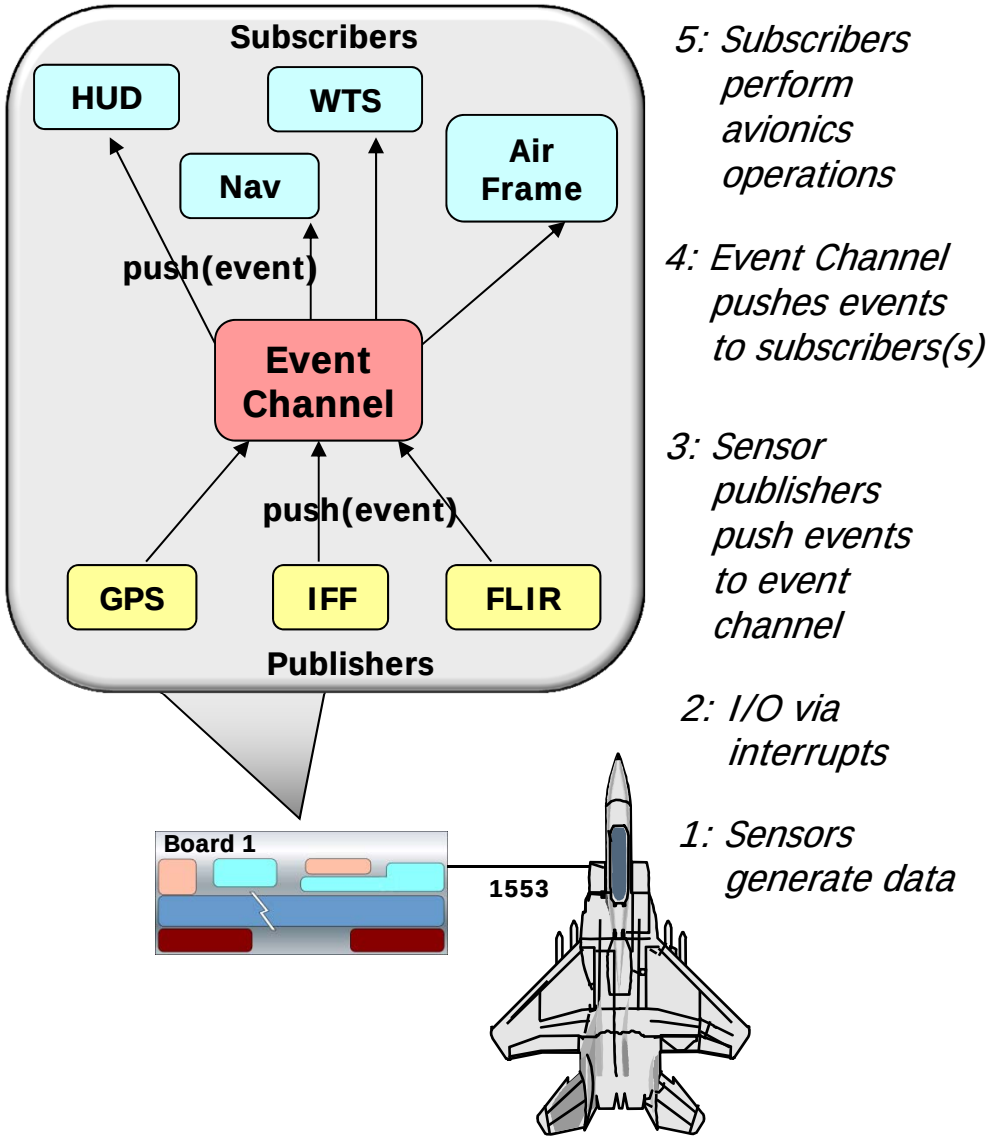
Applying Publisher-Subscriber to Bold Stroke

Bold Stroke uses the *Publisher-Subscriber* pattern to decouple sensor processing from mission computing operations

- Anonymous publisher & subscriber relationships
- Group communication
- Asynchrony

Implementing *Publisher-Subscriber* pattern for mission computing:

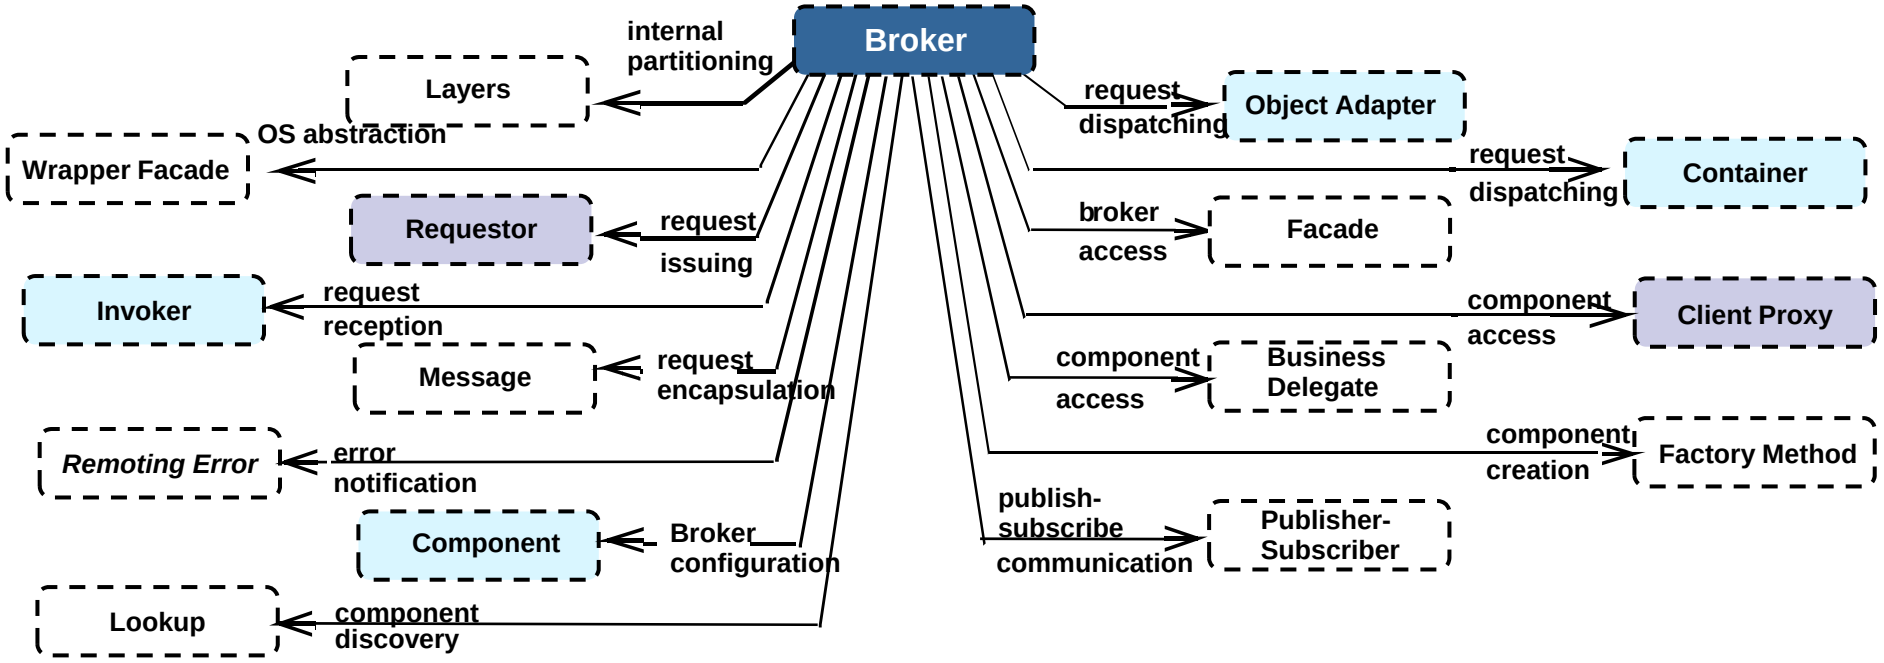
- *Event notification model*
  - Push control vs. pull data interactions
- *Scheduling & synchronization strategies*
  - e.g., priority-based dispatching & preemption
- *Event dependency management*
  - e.g., filtering & correlation mechanisms



Distributing Avionics Components

Context	Problems	Solution

• Mission computing requires remote IPC
• Stringent DRE requirements
	• Applications need capabilities to:
	  • Support remote communication
	  • Provide location transparency
	  • Handle faults
	  • Manage end-to-end QoS
	  • Encapsulate low-level system details
		• Apply the ***Broker*** architectural pattern to provide platform-neutral communication between mission computing boards

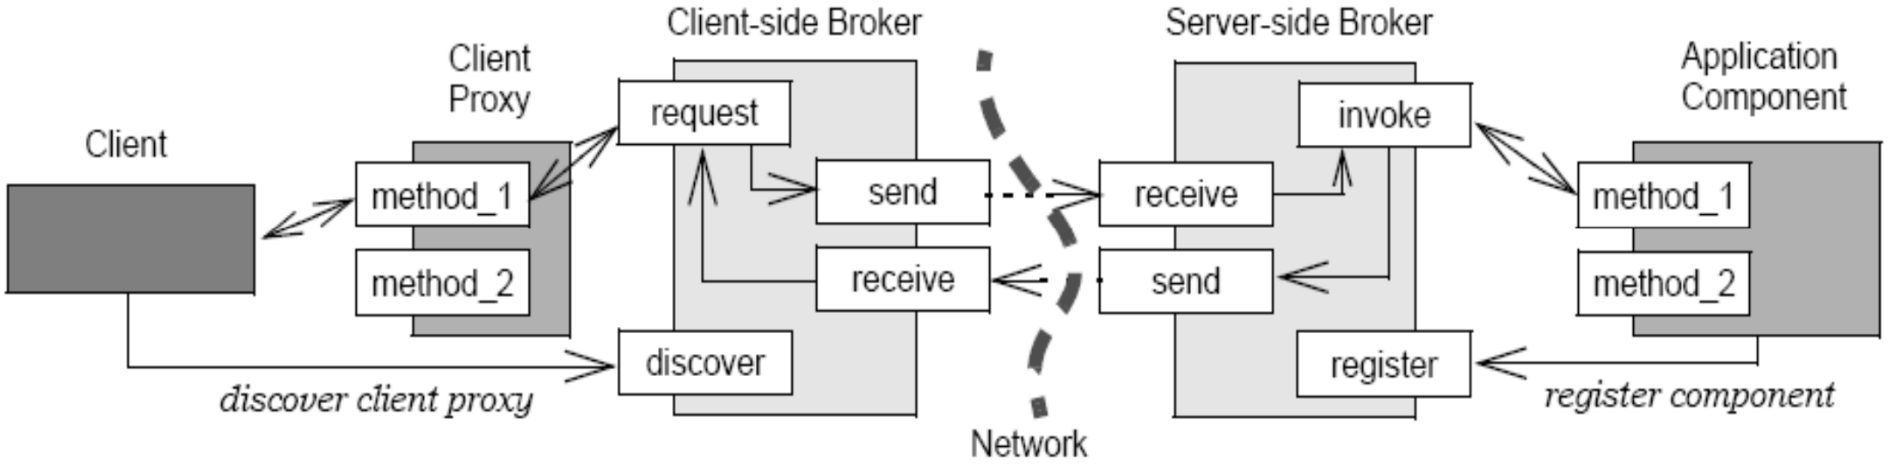


Distributing Avionics Components

Context	Problems	Solution

• Mission computing requires remote IPC
• Stringent DRE requirements
	• Applications need capabilities to:
	  • Support remote communication
	  • Provide location transparency
	  • Handle faults
	  • Manage end-to-end QoS
	  • Encapsulate low-level system details
		• Apply the ***Broker*** architectural pattern to provide platform-neutral communication between mission computing boards

Structure & Dynamics



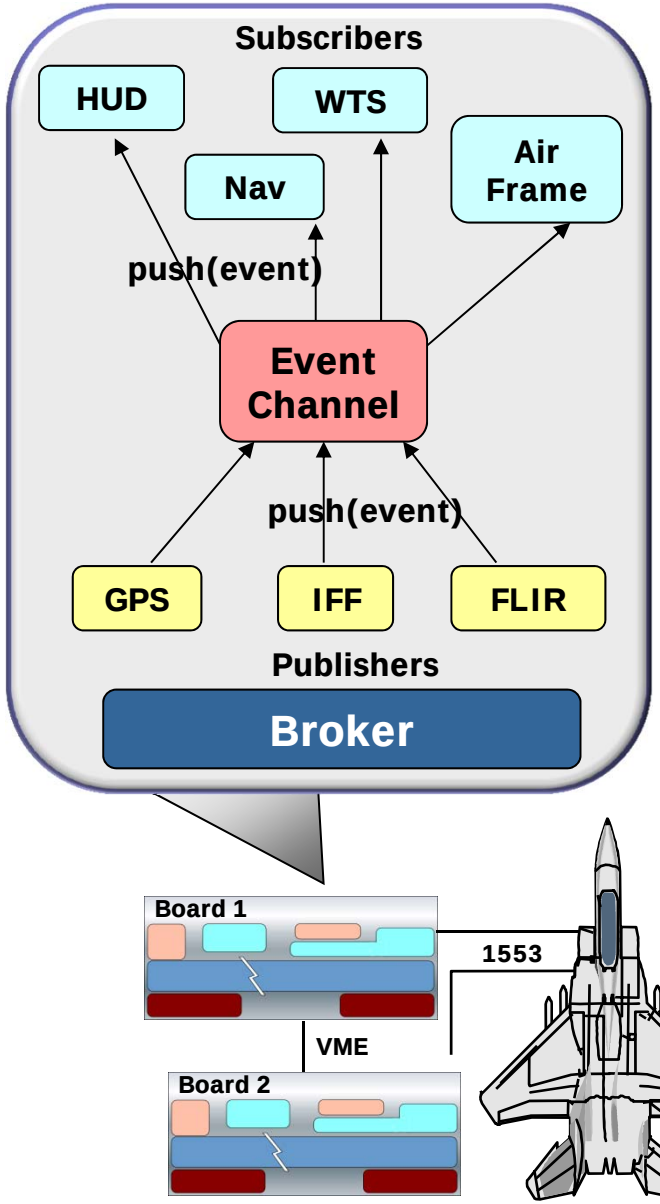
Applying the Broker Pattern to Bold Stroke

Bold Stroke uses the *Broker* pattern to shield distributed applications from environment heterogeneity, *e.g.,*

- Programming languages
- Operating systems
- Networking protocols
- Hardware

A key consideration for implementing the *Broker* pattern for mission computing applications is *QoS* support

- e.g., latency, jitter, priority preservation, dependability, security, etc.



6: Subscribers perform avionics operations

5: Event Channel pushes events to subscribers(s)

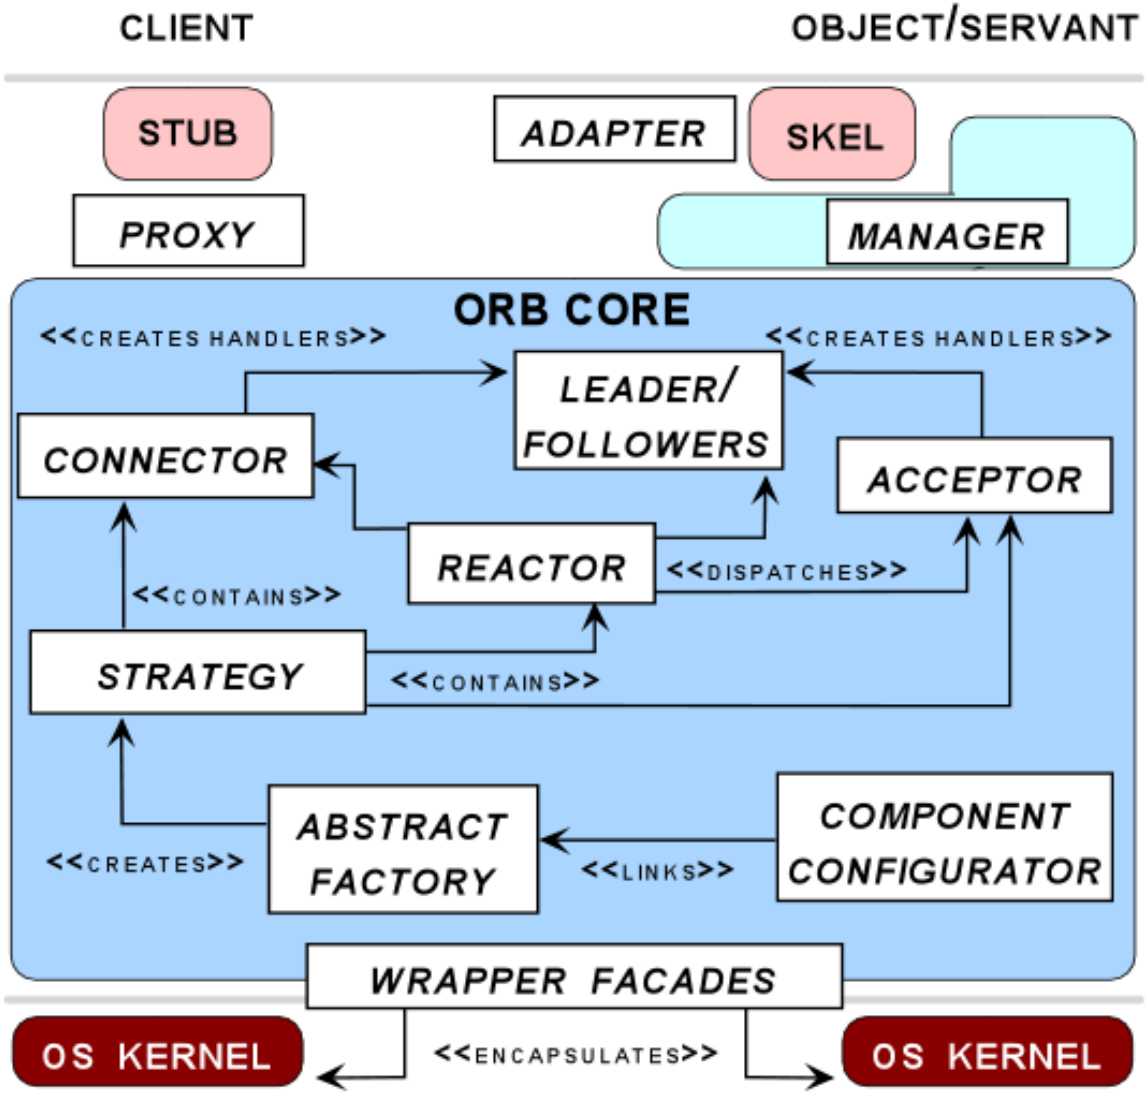
4: Sensor publishers push events to event channel

3: Broker handles I/O via upcalls

2: I/O via interrupts

1: Sensors generate data

Key Patterns Used to Implement Broker

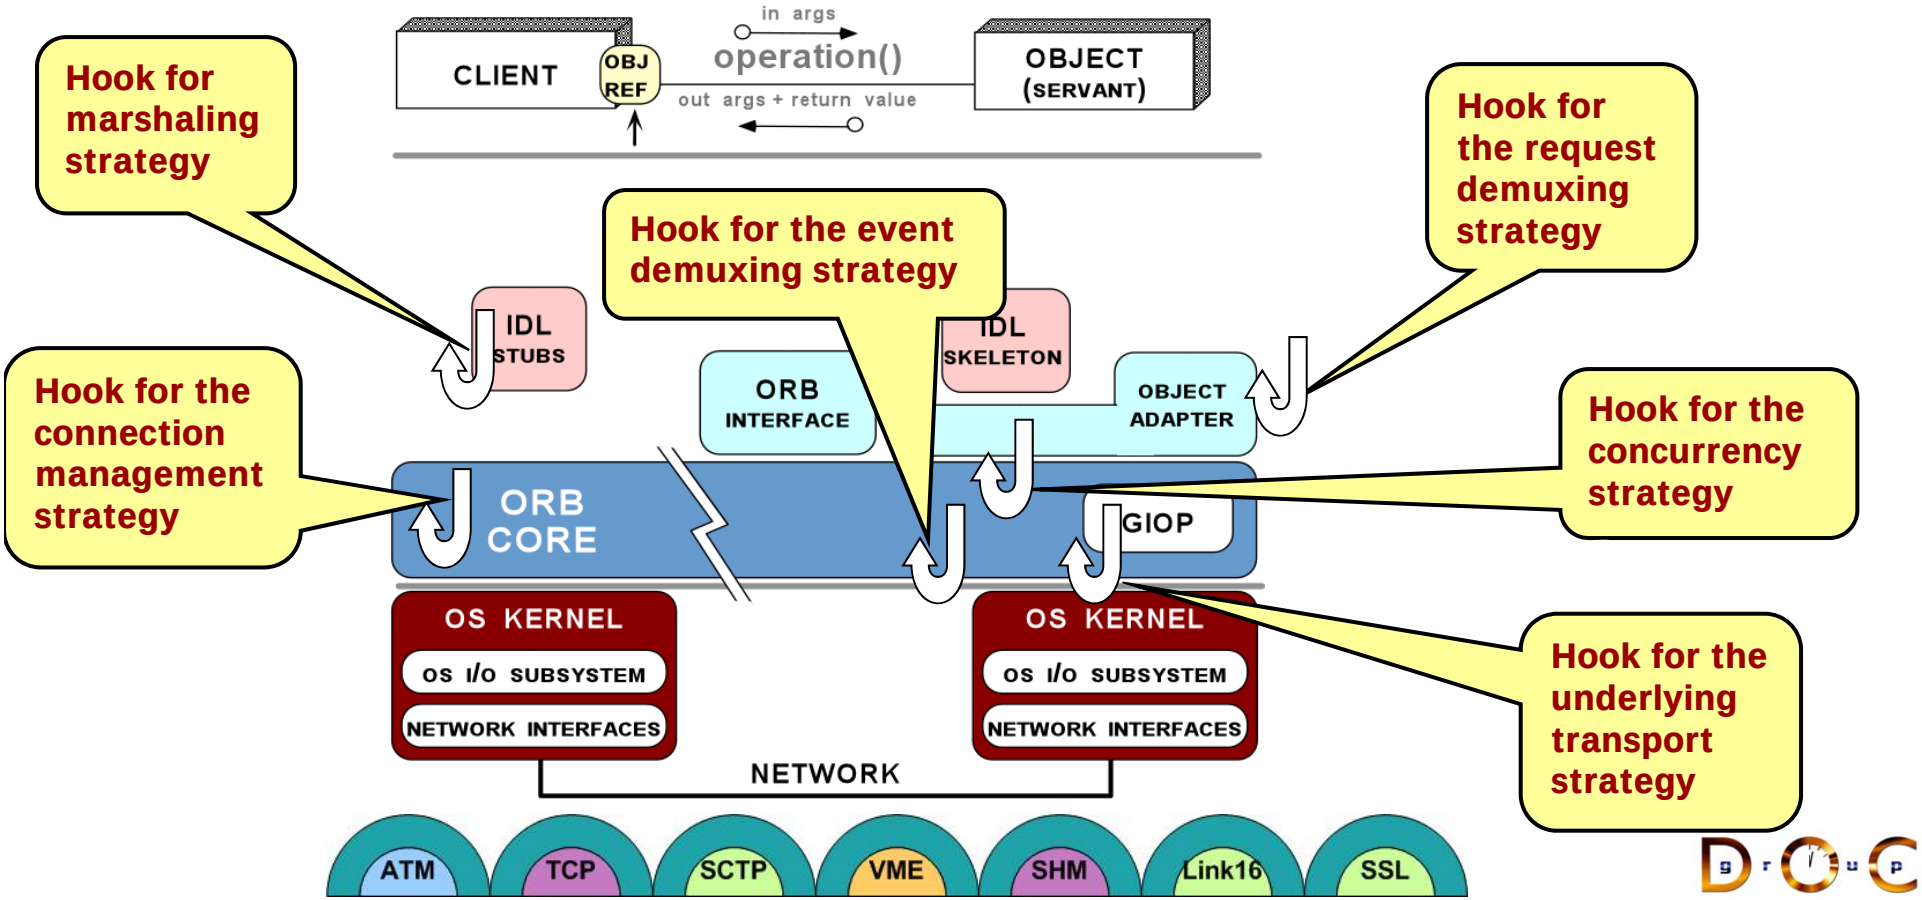


- *Wrapper facades* enhance portability
- *Proxies & adapters* simplify client & server applications, respectively
- *Component Configurator* dynamically configures *Factories*
- *Factories* produce *Strategies*
- *Strategies* implement interchangeable policies
- Concurrency strategies use *Reactor* & *Leader/Followers*
- *Acceptor-Connector* decouples connection management from request processing
- *Managers* optimize request demultiplexing

www.dre.vanderbilt.edu/~schmidt/PDF/ORB-patterns.pdf

Enhancing Broker Flexibility with Strategy

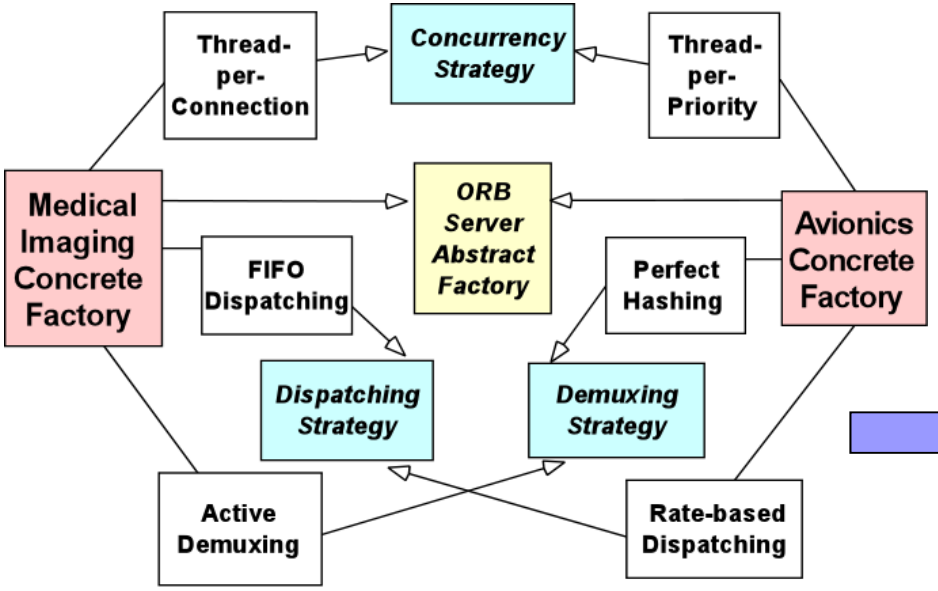
Context	Problem	Solution
• Multi-domain reusable middleware Broker	• Flexible Brokers must support multiple policies for event & request demuxing, scheduling, (de)marshaling, connection mgmt, request transfer, & concurrency	• Apply the ***Strategy*** pattern to factory out commonality amongst variable Broker algorithms & policies



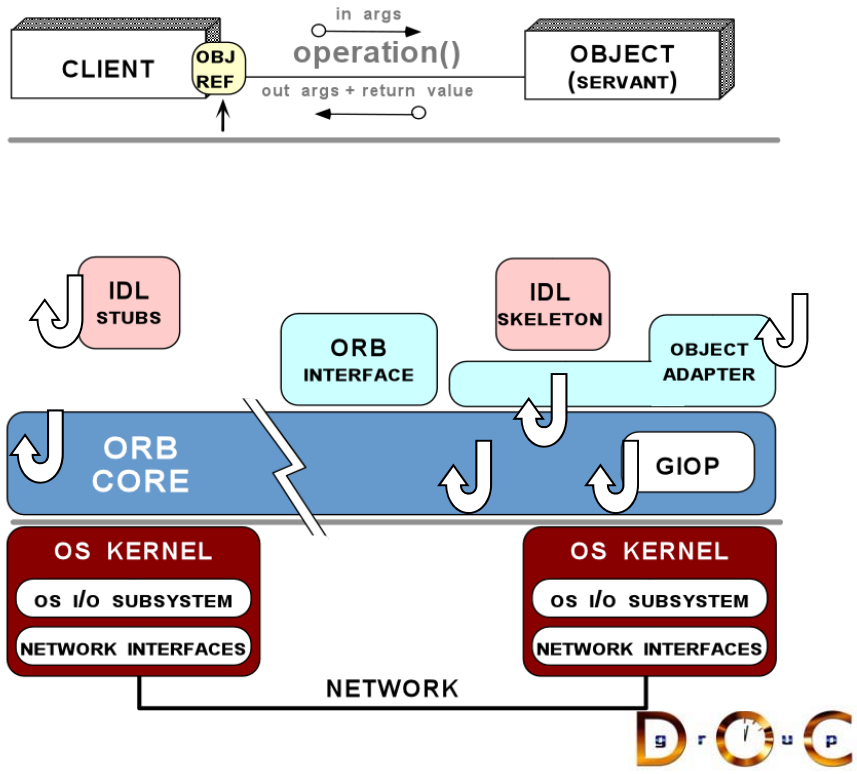
Consolidating Strategies with Abstract Factory

Context	Problem	Solution

• A heavily strategized framework or application	• Aggressive use of Strategy pattern creates a configuration nightmare
	  • Managing many individual strategies is hard
	  • It's hard to ensure that groups of semantically compatible strategies are configured
		• Apply the ***Abstract Factory*** pattern to consolidate multiple Broker strategies into semantically compatible configurations



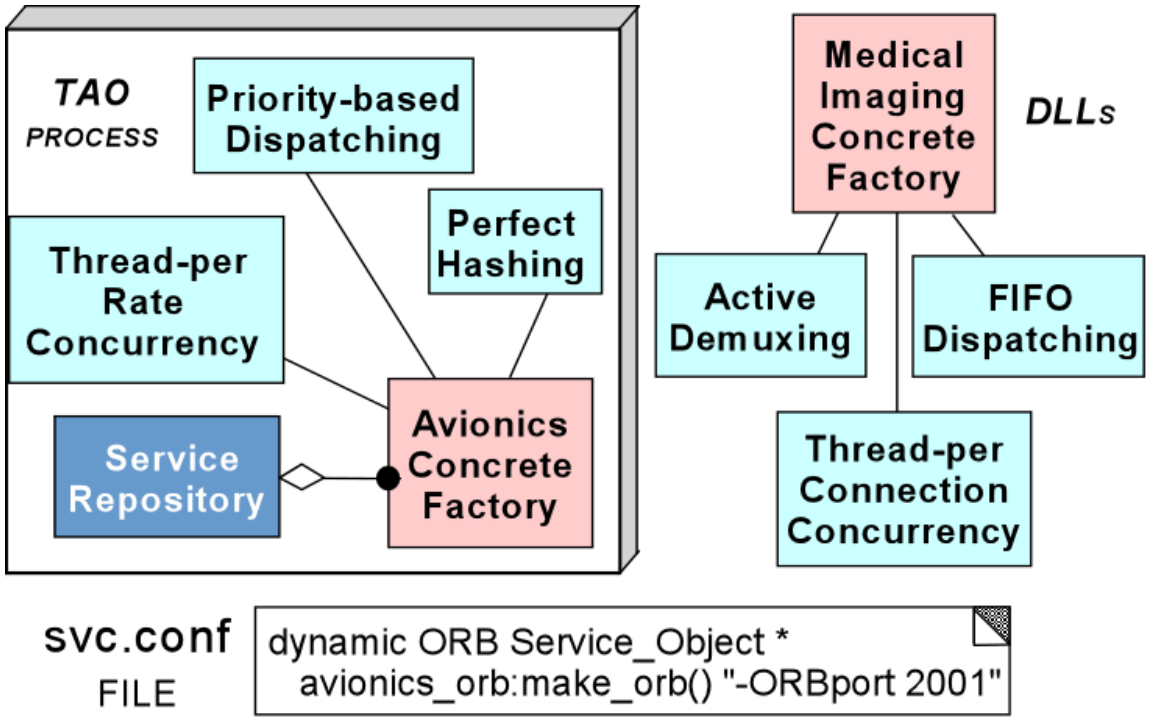
Concrete factories create groups of strategies



Configuring Factories w/ Component Configurator

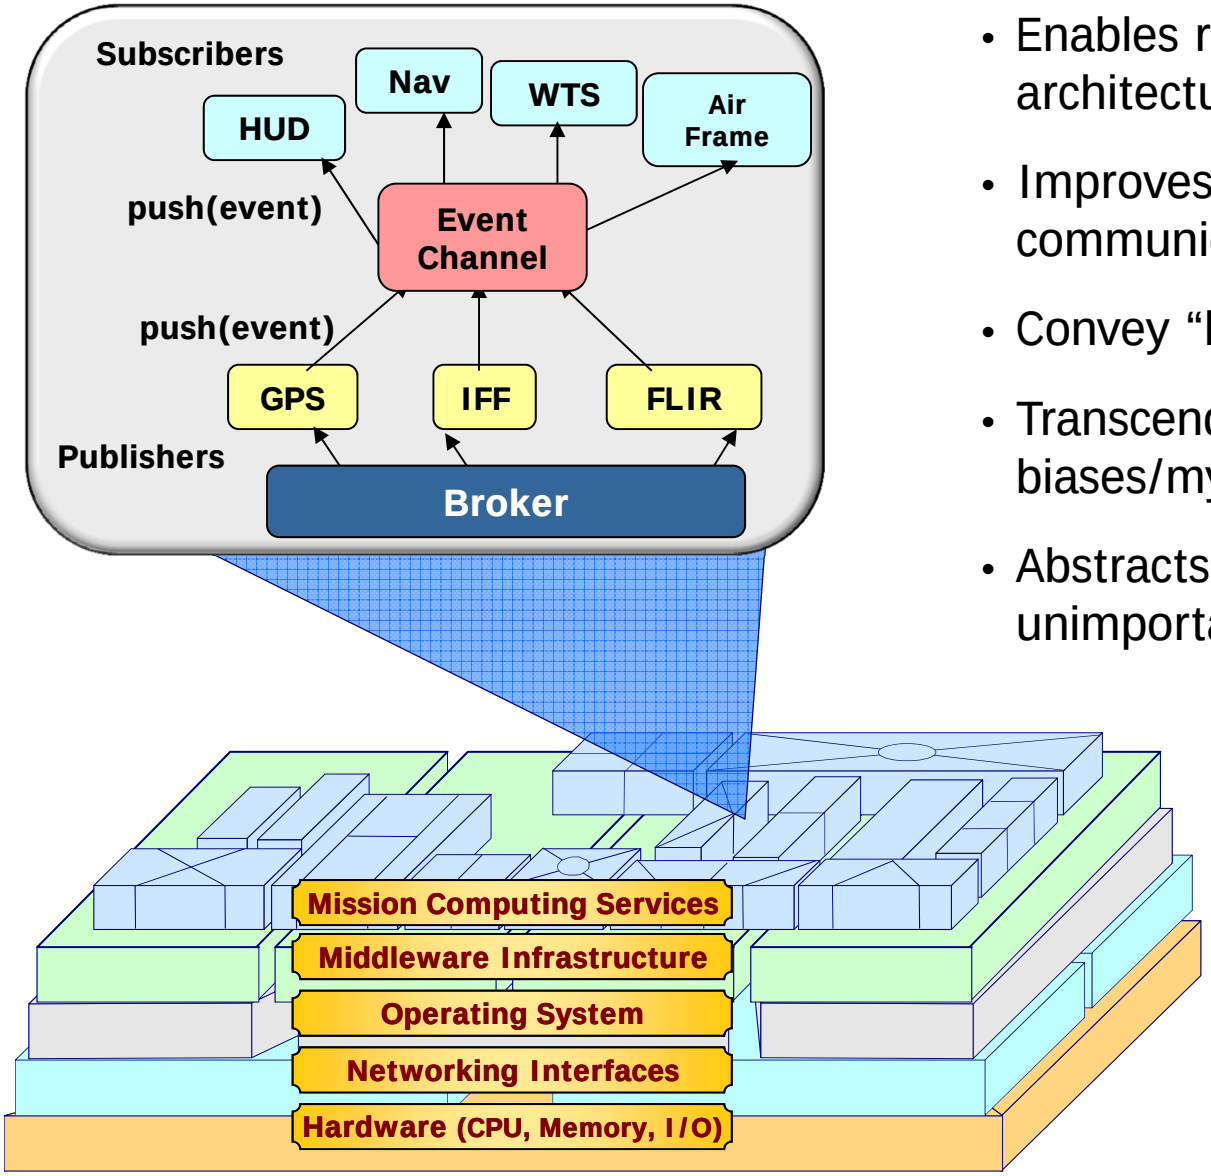
Context	Problem	Solution

• Resource constrained systems	• Prematurely commiting to a Broker configuration is inflexible & inefficient
	  • Certain decisions can't be made until runtime
	  • Users forced to pay for components they don't use
		• Apply the ***Component Configurator*** pattern to assemble the desired Broker factories & strategies more effectively



- Broker strategies are decoupled from when the strategy implementations are configured into Broker
- This pattern can reduce the memory footprint of Broker implementations

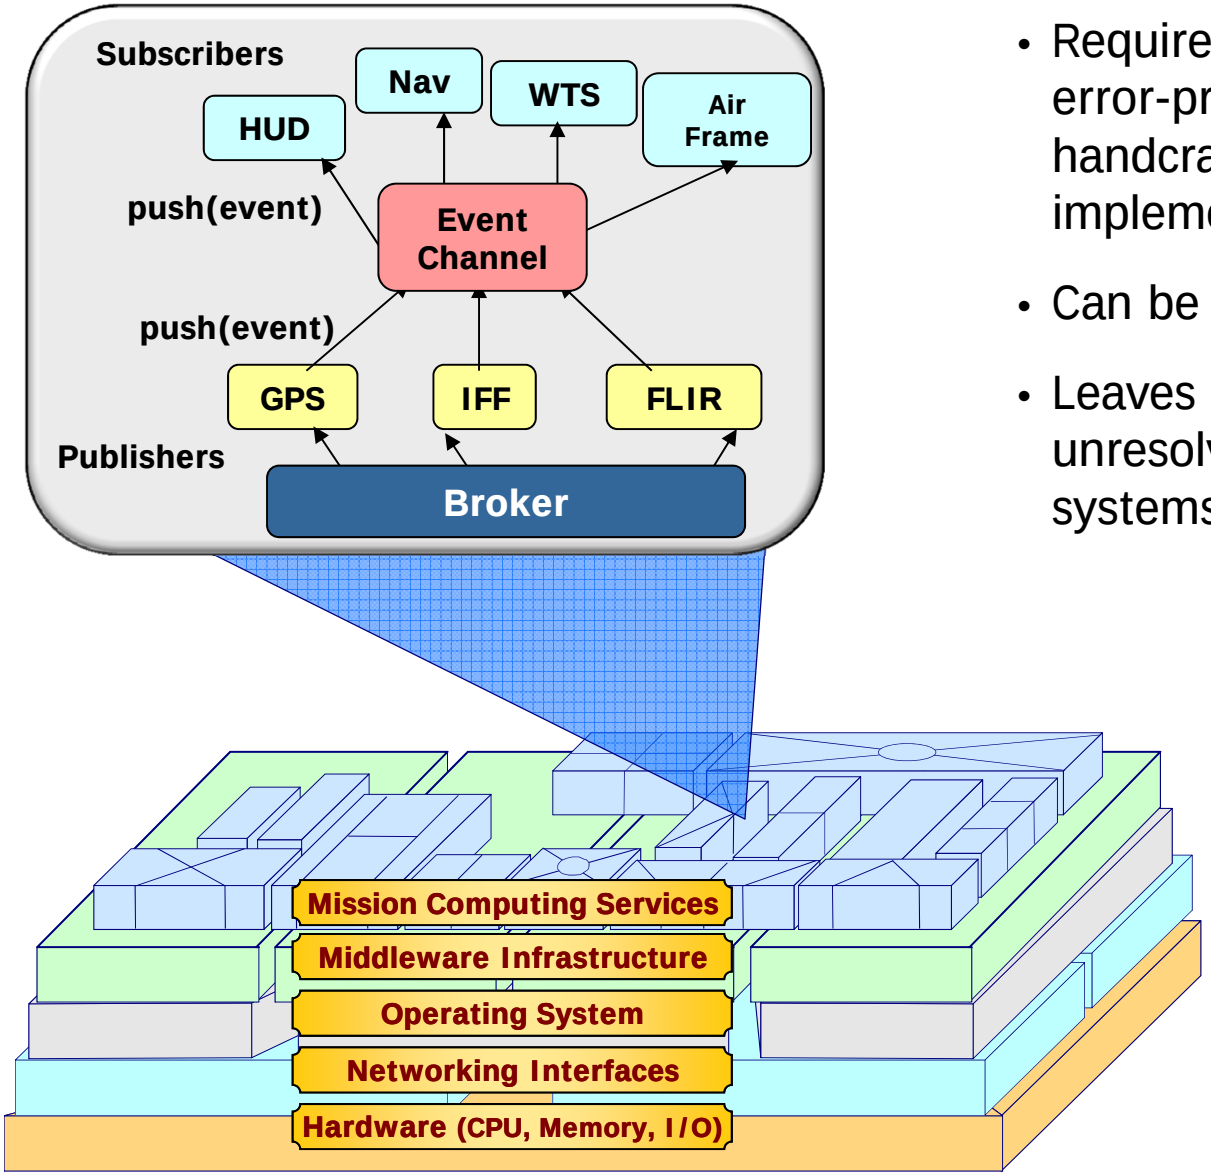
Benefits of Patterns



- Enables reuse of software architectures & designs
- Improves development team communication
- Convey "best practices" intuitively
- Transcends language-centric biases/myopia
- Abstracts away from many unimportant details

www.dre.vanderbilt.edu/~schmidt/patterns.html

Limitations of Patterns

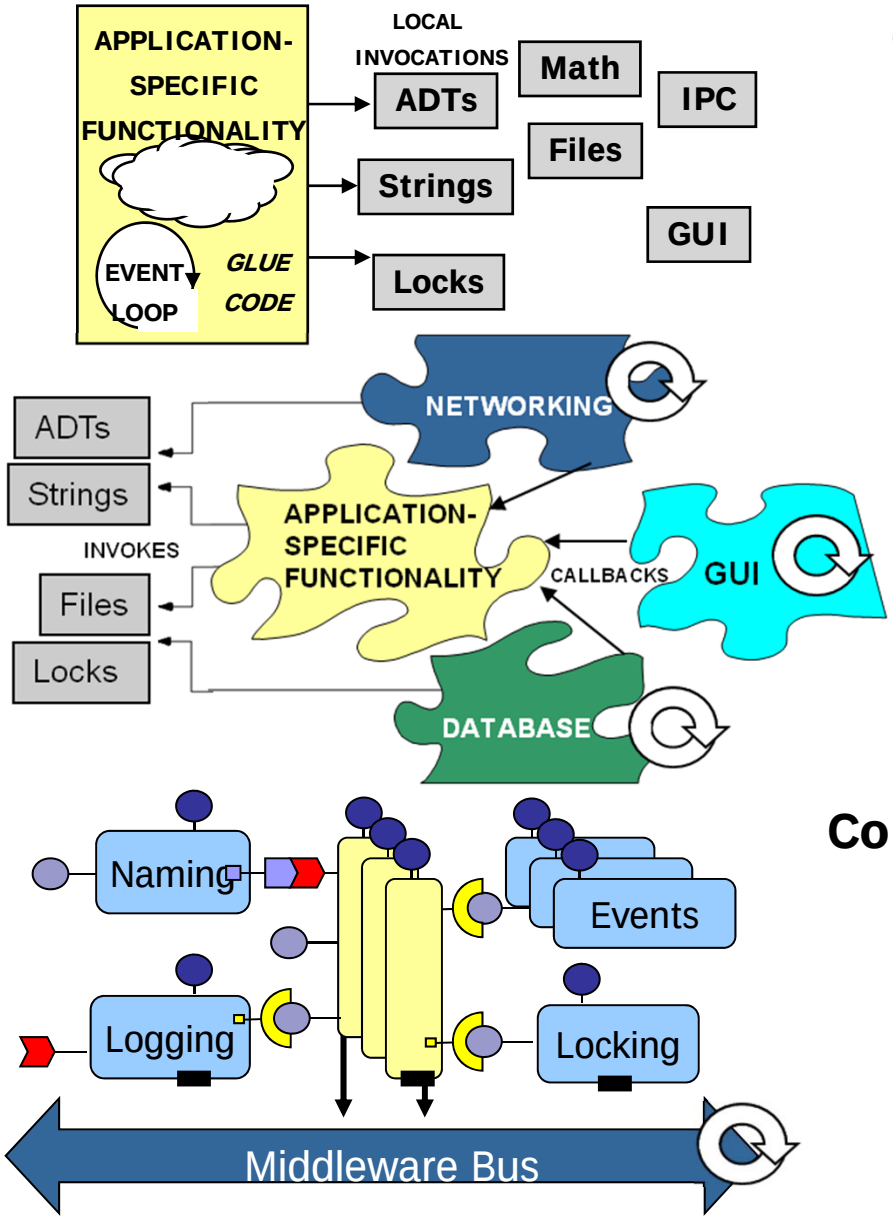


- Require significant tedious & error-prone human effort to handcraft pattern implementations
- Can be deceptively simple
- Leaves many important details unresolved, particularly for DRE systems

We therefore need more than just patterns to achieve effective systematic reuse

www.dre.vanderbilt.edu/~schmidt/patterns.html

Overview of Systematic Reuse Paradigms



Class Library Architecture

- A *class* is a unit of abstraction & implementation in an OO programming language, i.e., a reusable *type* that often implements *patterns*
- Classes are typically *passive*

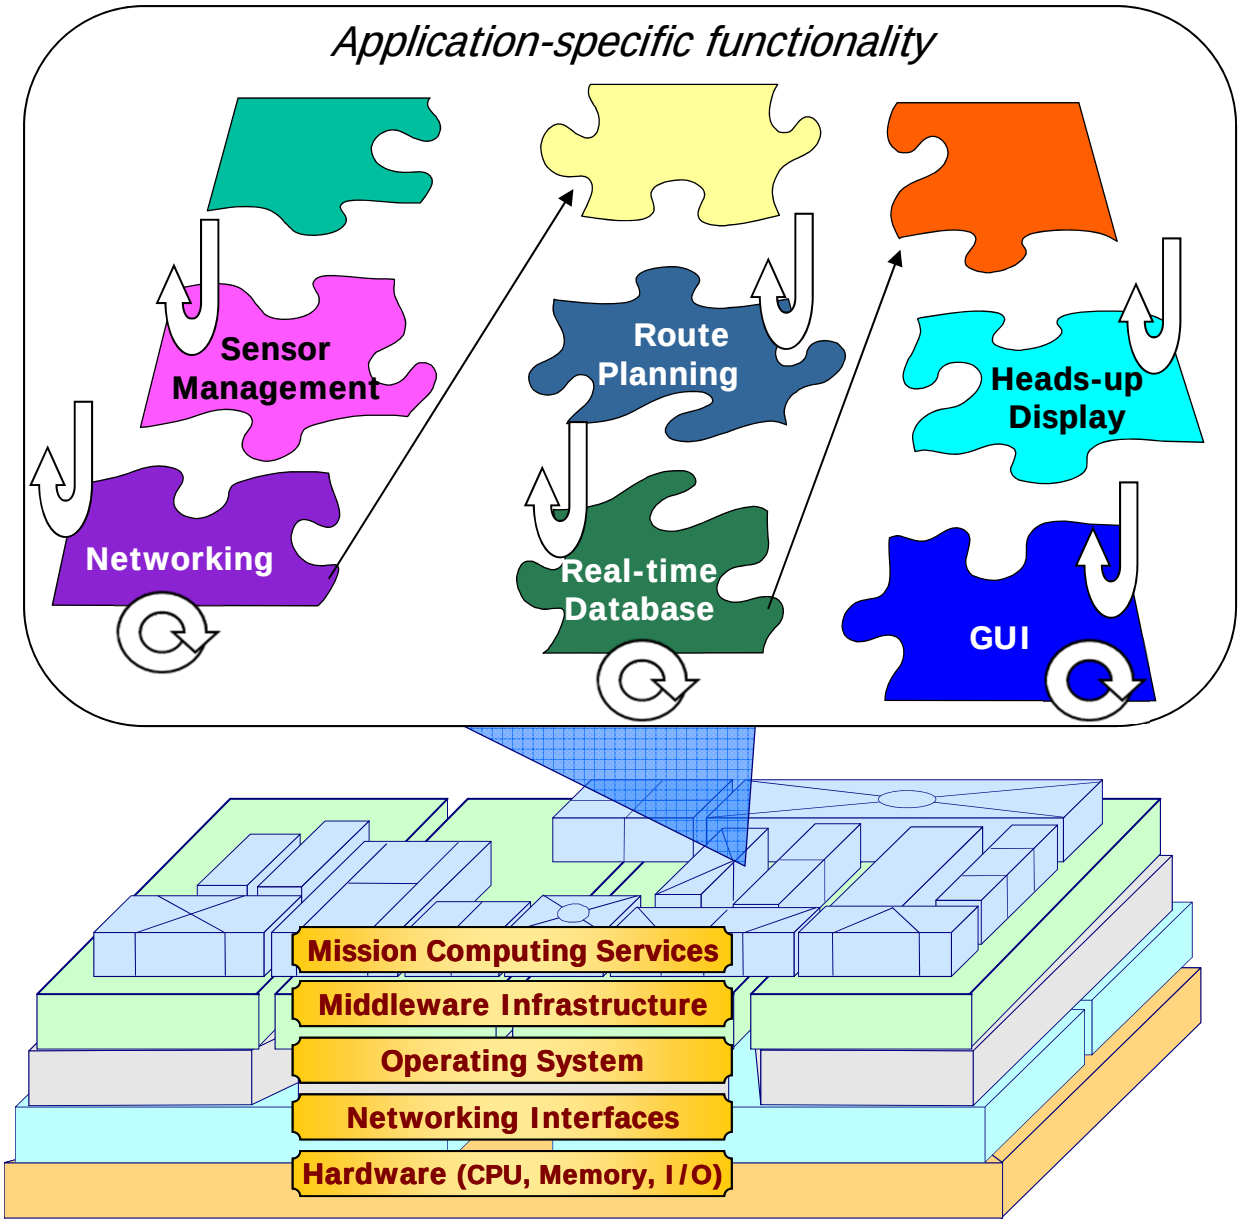
Framework Architecture

- A *framework* is an integrated set of classes that collaborate to produce a reusable architecture for a family of applications
- Frameworks implement *pattern languages*

Component/Service-Oriented Architecture

- A *component/service* is an encapsulation unit with one or more interfaces that provide clients with access to its services
- Components/services can be deployed & configured via *assemblies*

Applying Frameworks to Bold Stroke



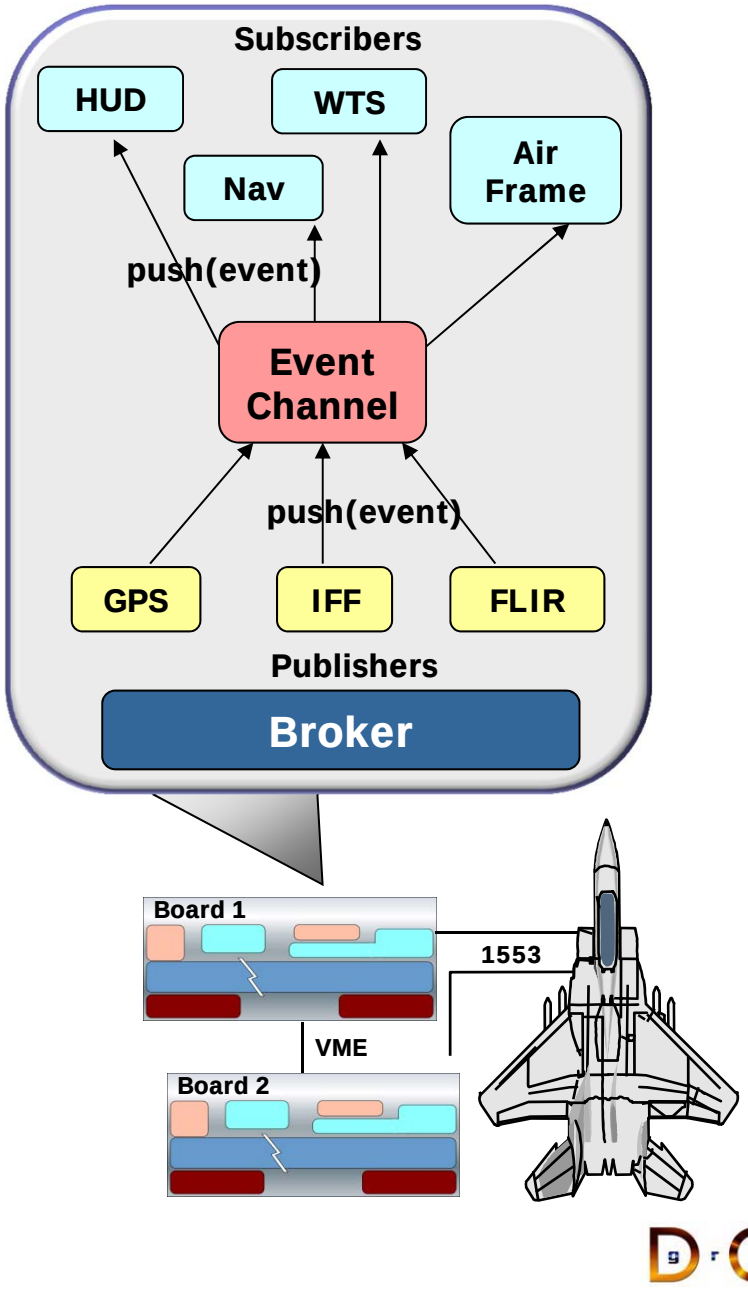
Framework characteristics

- Frameworks exhibit "inversion of control" at runtime via callbacks
- Frameworks provide integrated domain-specific structures & functionality
- Frameworks are "semi-complete" applications

www.dre.vanderbilt.edu/~schmidt/frameworks.html

Benefits of Frameworks

- Design reuse
  - e.g., by implementing patterns that guide application developers through the steps necessary to ensure successful creation & deployment of avionics software



Benefits of Frameworks

- Design reuse
  - e.g., by implementing patterns that guide application developers through the steps necessary to ensure successful creation & deployment of avionics software
- Implementation reuse
  - e.g., by amortizing software lifecycle costs & leveraging previous development & optimization efforts

```
package org.apache.tomcat.session;

import org.apache.tomcat.core.*;
import org.apache.tomcat.util.StringManager;
import java.io.*;
import java.net.*;
import java.util.*;
import javax.servlet.*;
import javax.servlet.http.*;

/**
 * Core implementation of a server session
 *
 * @author James Duncan Davidson [duncan@eng.sun.com]
 * @author James Todd [gonzo@eng.sun.com]
 */

public class ServerSession {

    private StringManager sm =
        StringManager.getManager("org.apache.tomcat.session");
    private Hashtable values = new Hashtable();
    private Hashtable appSessions = new Hashtable();
    private String id;
    private long creationTime = System.currentTimeMillis();;
    private long thisAccessTime = creationTime;
    private int inactiveInterval = -1;

    ServerSession(String id) { this.id = id; }

    public String getId() { return id; }

    public long getCreationTime() { return creationTime; }

    public ApplicationSession getApplicationSession(Context context,
        boolean create) {
        ApplicationSession appSession =
            (ApplicationSession)appSessions.get(context);

        if (appSession == null && create) {

            // XXX
            // sync to ensure valid?

            appSession = new ApplicationSession(id, this, context);
            appSessions.put(context, appSession);
        }

        // XXX
        // make sure that we haven't gone over the end of our
        // inactive interval -- if so, invalidate & create
        // a new appSession

        return appSession;
    }

    void removeApplicationSession(Context context) {
        appSessions.remove(context);
    }
```

Benefits of Frameworks

- Design reuse
  - e.g., by implementing patterns that guide application developers through the steps necessary to ensure successful creation & deployment of avionics software
- Implementation reuse
  - e.g., by amortizing software lifecycle costs & leveraging previous development & optimization efforts
- Validation reuse
  - e.g., by amortizing the efforts of validating application- & platform-independent portions of software, thereby enhancing software reliability & scalability

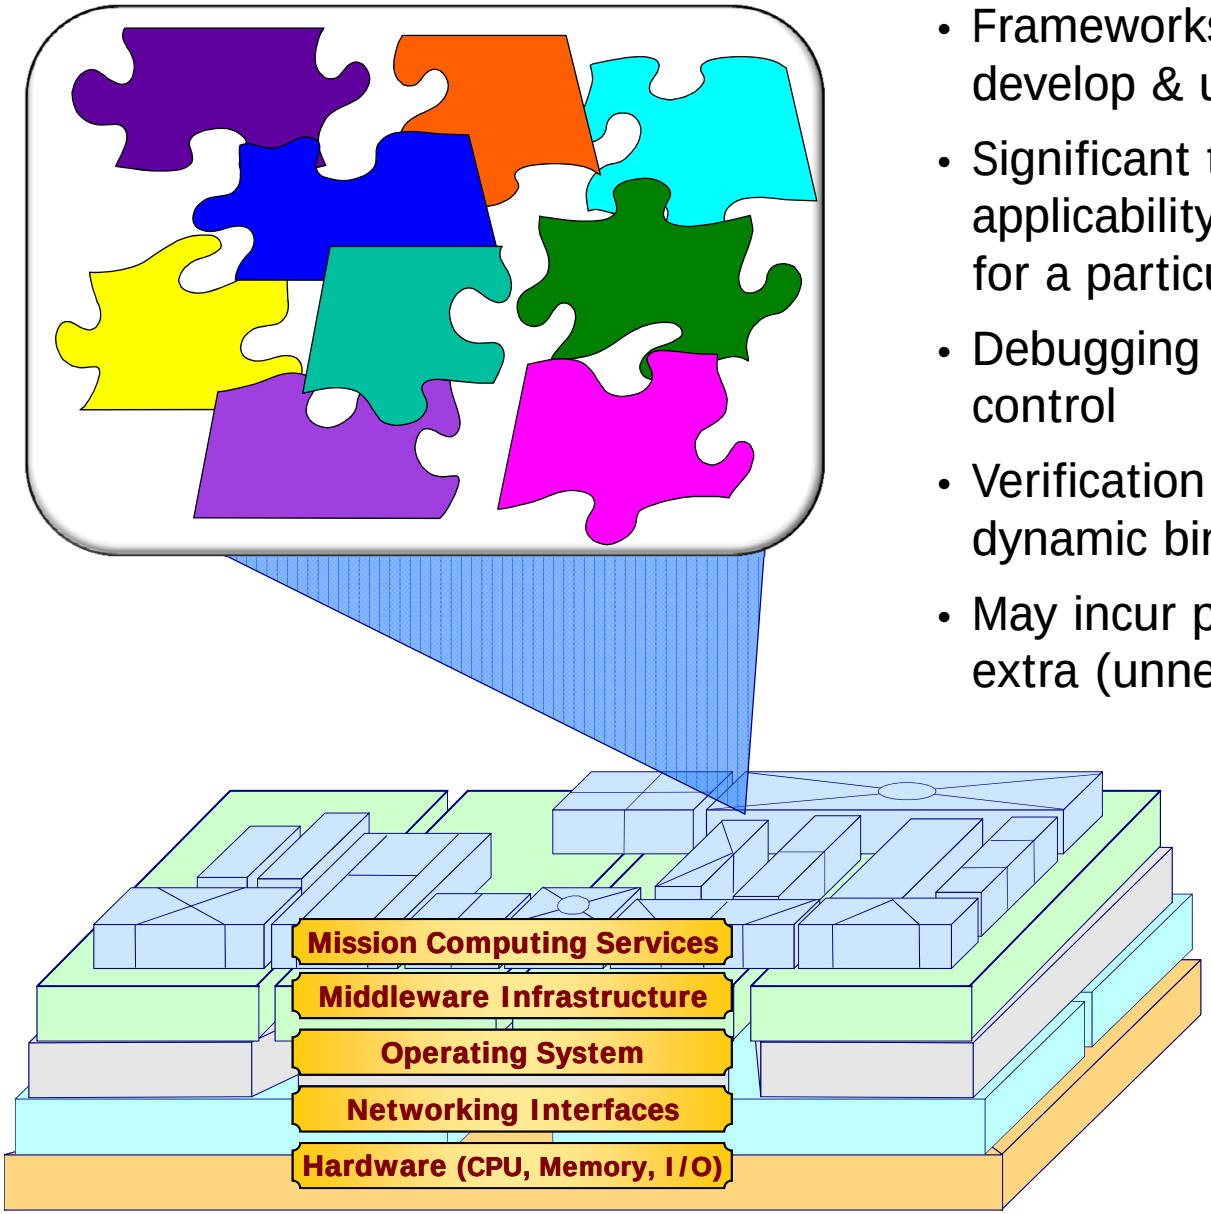
Lynx

Build Name	Last Finished	Config	Setup	Compile	Tests	Status

www.dre.vanderbilt.edu/scoreboard

Limitations of Frameworks

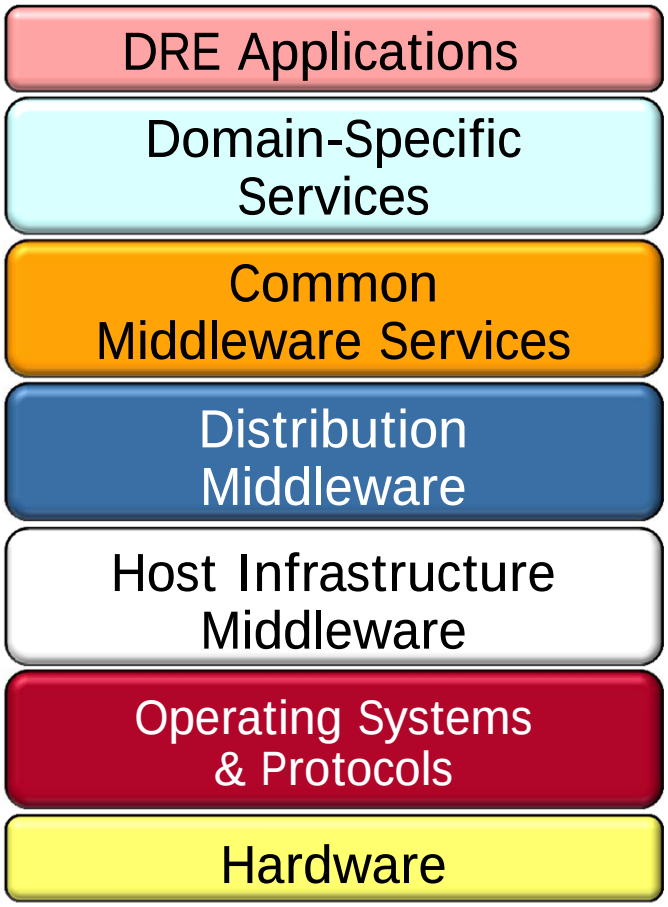


- Frameworks are powerful, but hard to develop & use effectively
- Significant time required to evaluate applicability & quality of a framework for a particular domain
- Debugging is tricky due to inversion of control
- Verification & validation is tricky due to dynamic binding
- May incur performance overhead due to extra (unnecessary) levels of indirection

We thus need something simpler than frameworks to achieve systematic reuse for DRE systems

www.dre.vanderbilt.edu/~schmidt/PDF/Queue-04.pdf

The Evolution of Middleware



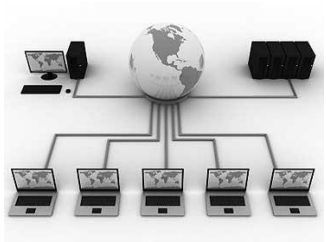
Historically, mission-critical DRE apps were built directly atop hardware & OS

- Tedious, error-prone, & costly over lifecycles

There are layers of middleware, just like there are layers of networking protocols

Standards-based COTS DRE middleware helps:

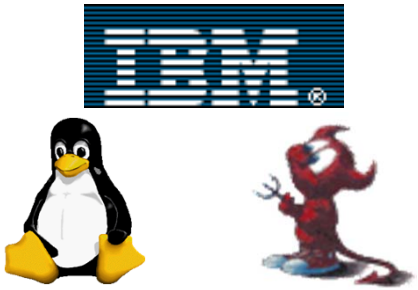
- Control end-to-end resources & QoS
- Leverage hardware & software technology advances
- Evolve to new environments & requirements
- Provide a wide array of reusable, off-the-shelf developer-oriented services



Middleware is pervasive in enterprise domain & is becoming pervasive in DRE domain

Operating System & Protocols

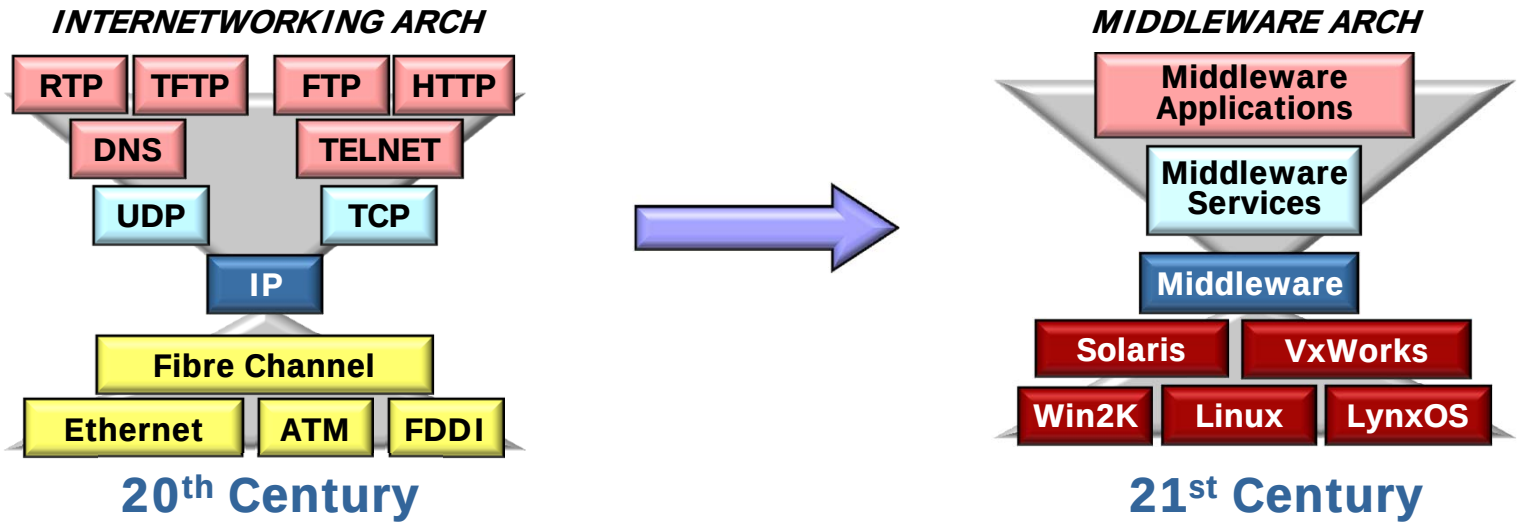
- Operating systems & protocols provide mechanisms to manage endsystem resources, e.g.,
  - CPU scheduling & dispatching
  - Virtual memory management
  - Secondary storage, persistence, & file systems
  - Local & remote interprocess communication (IPC)
- OS examples
  - UNIX/Linux, Windows, VxWorks, QNX, etc.
- Protocol examples
  - TCP, UDP, IP, SCTP, RTP, etc.



redhat

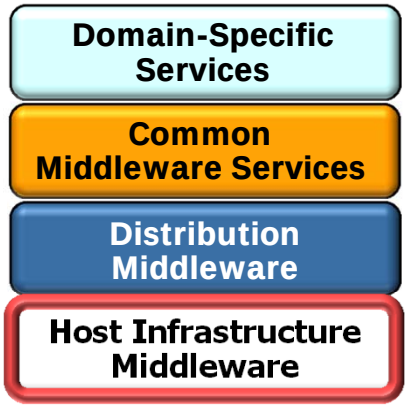
TimeSys

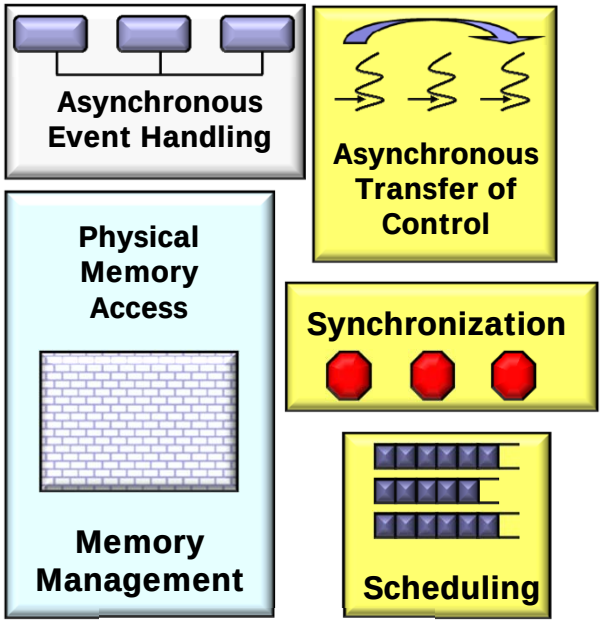
Microsoft



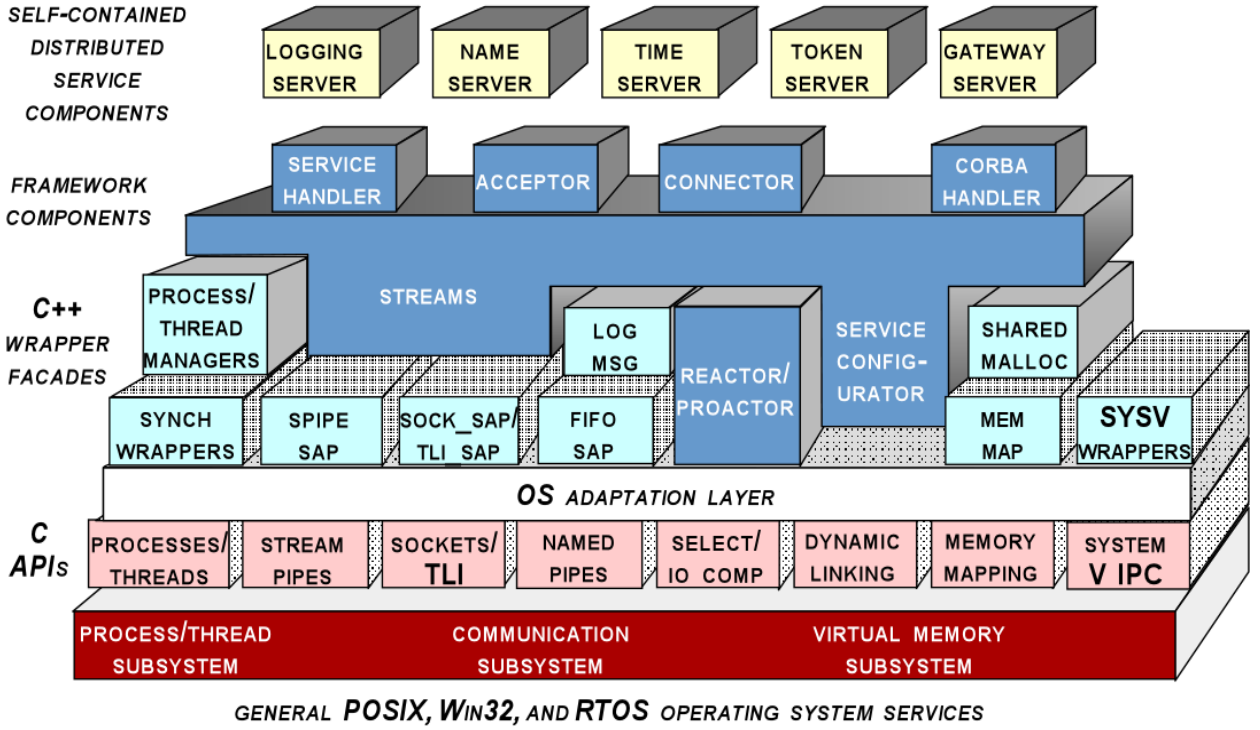
Host Infrastructure Middleware

- Host infrastructure middleware encapsulates & enhances native OS mechanisms to create reusable network programming objects
  - These components abstract away many tedious & error-prone aspects of low-level OS APIs
- Examples
  - Java Virtual Machine (JVM), Common Language Runtime (CLR), ADAPTIVE Communication Environment (ACE)





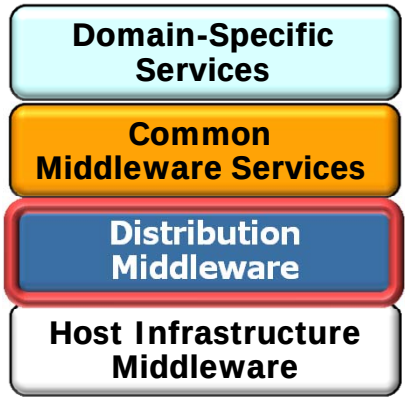
www.rtj.org

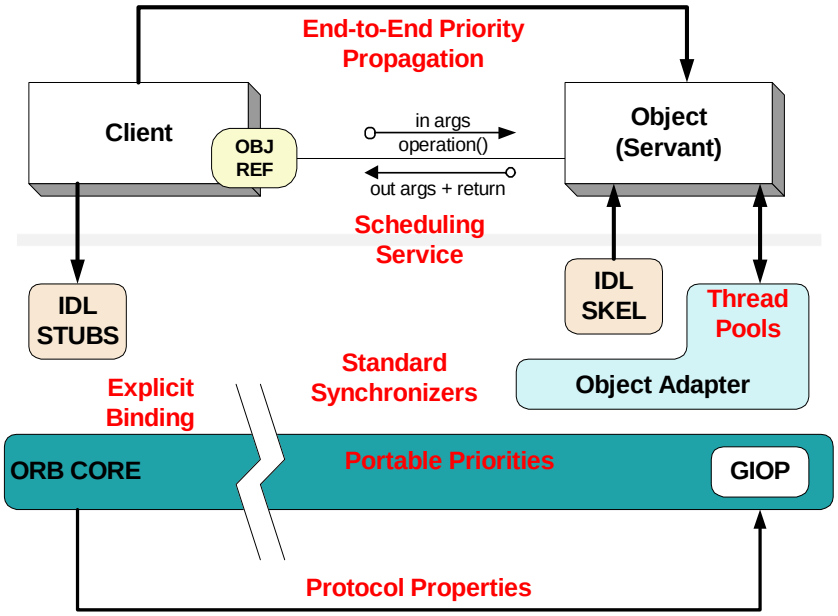


www.dre.vanderbilt.edu/~schmidt/ACE.html

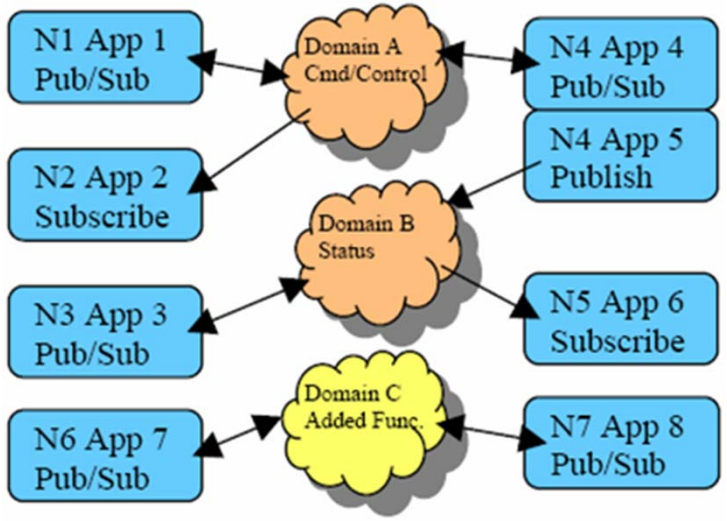
Distribution Middleware

- *Distribution middleware* defines higher-level distributed programming models whose reusable APIs & components automate & extend native OS capabilities
- Examples
  - OMG Real-time CORBA & DDS, Sun RMI, Microsoft DCOM, W3C SOAP





realtime.omg.org



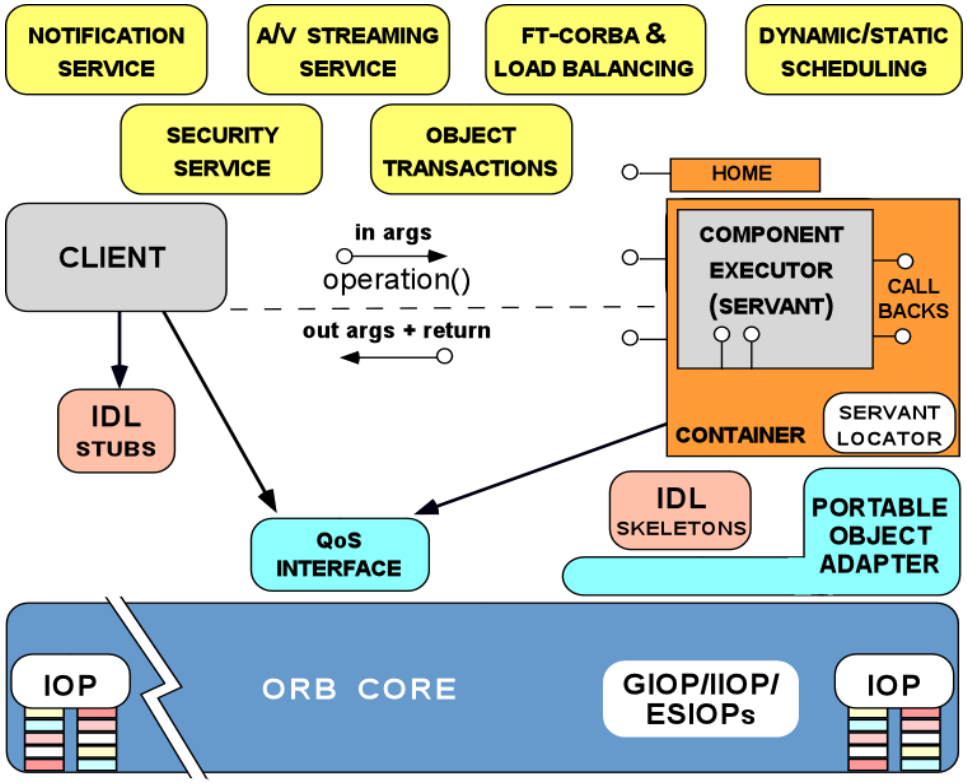
en.wikipedia.org/wiki/Data_Distribution_Service

Distribution middleware avoids hard-coding client & server application dependencies on object location, language, OS, protocols, & hardware

Common Middleware Services

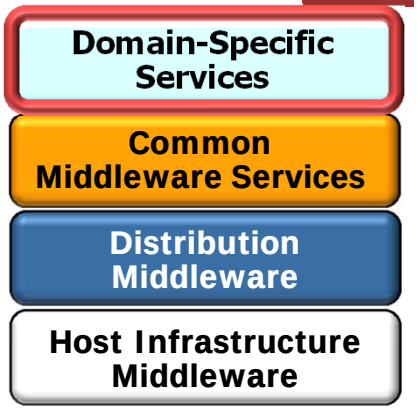
- *Common middleware services* augment distribution middleware by defining higher-level domain-independent services that focus on programming "business logic"

- Examples
  - W3C Web Services, CORBA Component Model & Object Services, Sun's J2EE, Microsoft's .NET, etc.



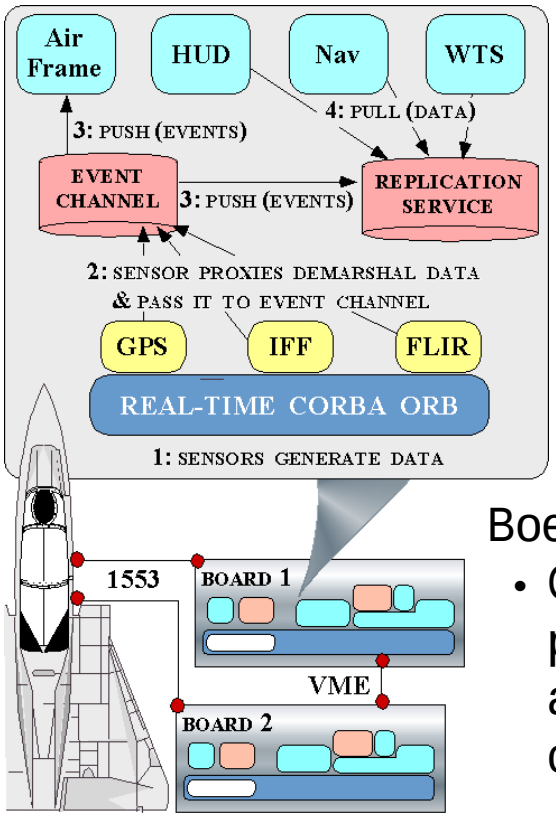
- Common middleware services support many recurring distributed system capabilities, e.g.,
  - Transactional behavior
  - Authentication & authorization,
  - Database connection pooling & concurrency control
  - Active replication
  - Dynamic resource management

Domain-Specific Middleware



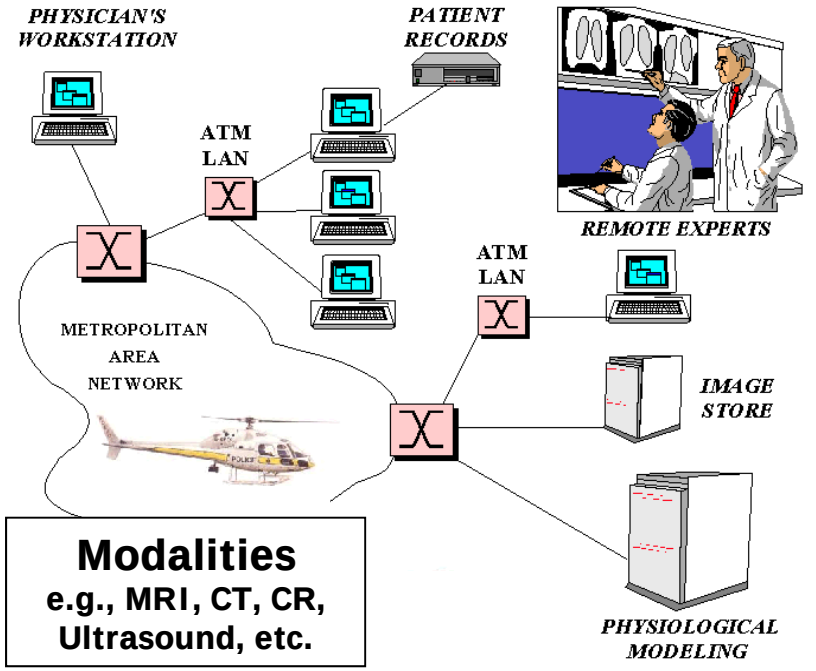
- *Domain-specific middleware services* are tailored to the requirements of particular domains, such as telecom, e-commerce, health care, process automation, or aerospace

- Examples



Siemens MED Syngo

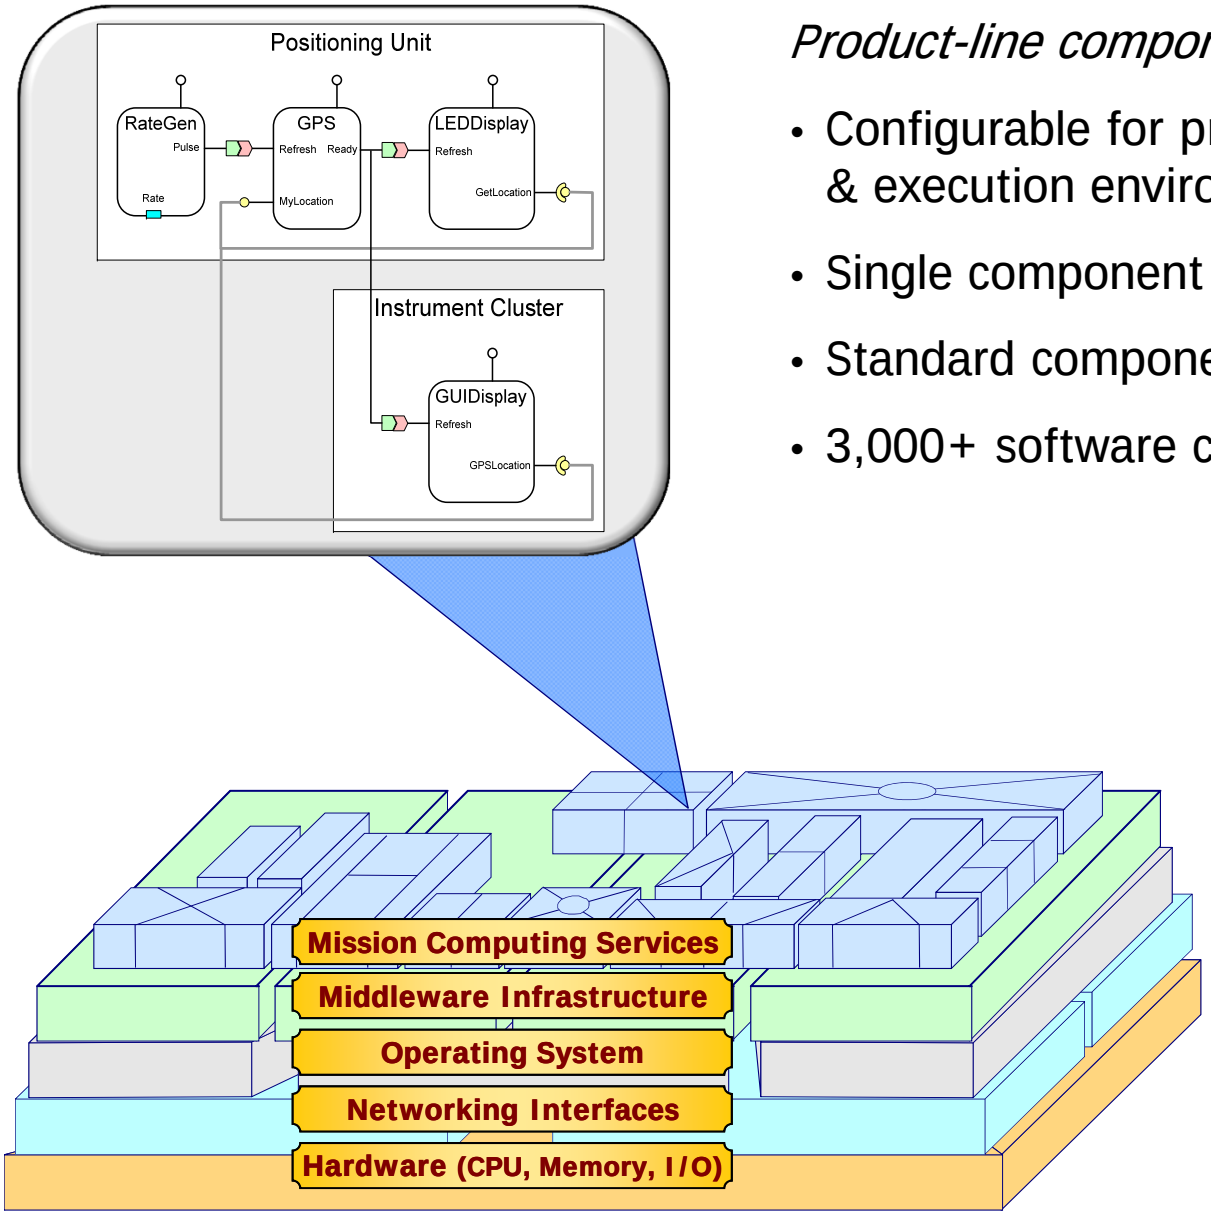
- Common software platform for distributed electronic medical systems
- Used by all Siemens MED business units worldwide



Boeing Bold Stroke

- Common software platform for Boeing avionics mission computing systems

Applying Component Middleware to Bold Stroke

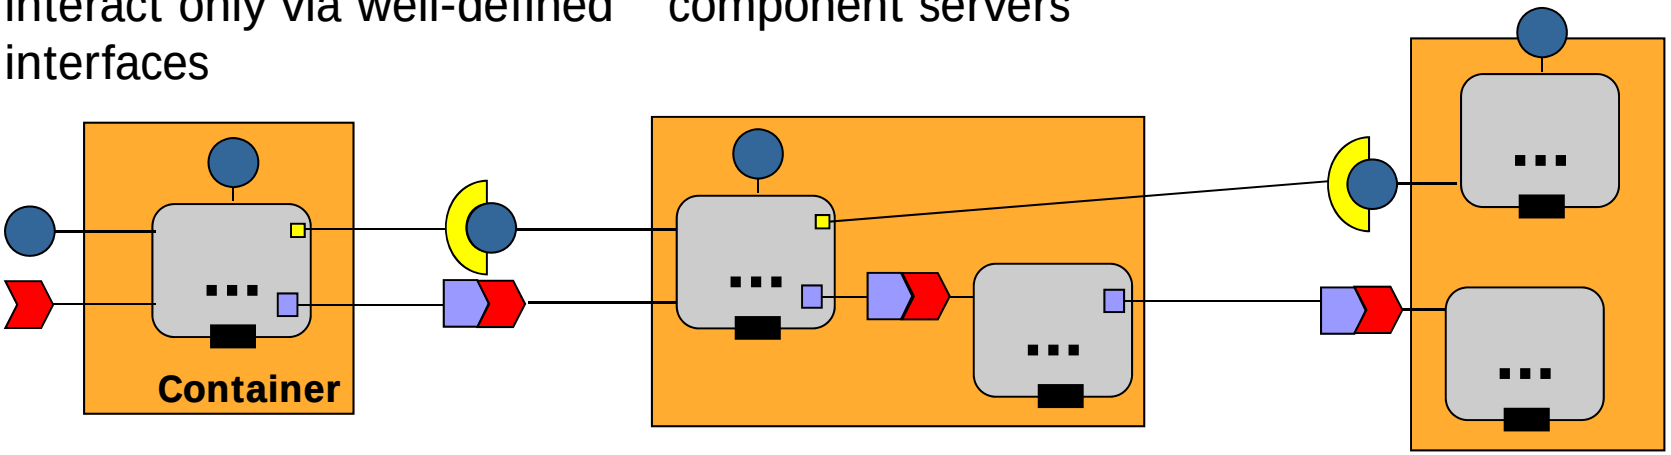


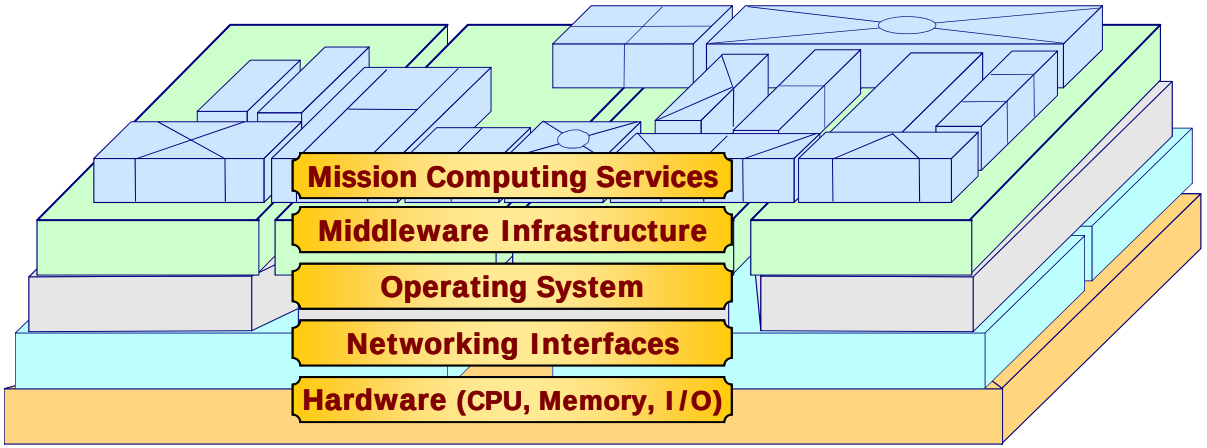
Product-line component model

- Configurable for product-specific functionality & execution environment
- Single component development policies
- Standard component packaging mechanisms
- 3,000+ software components

Benefits of Component Middleware

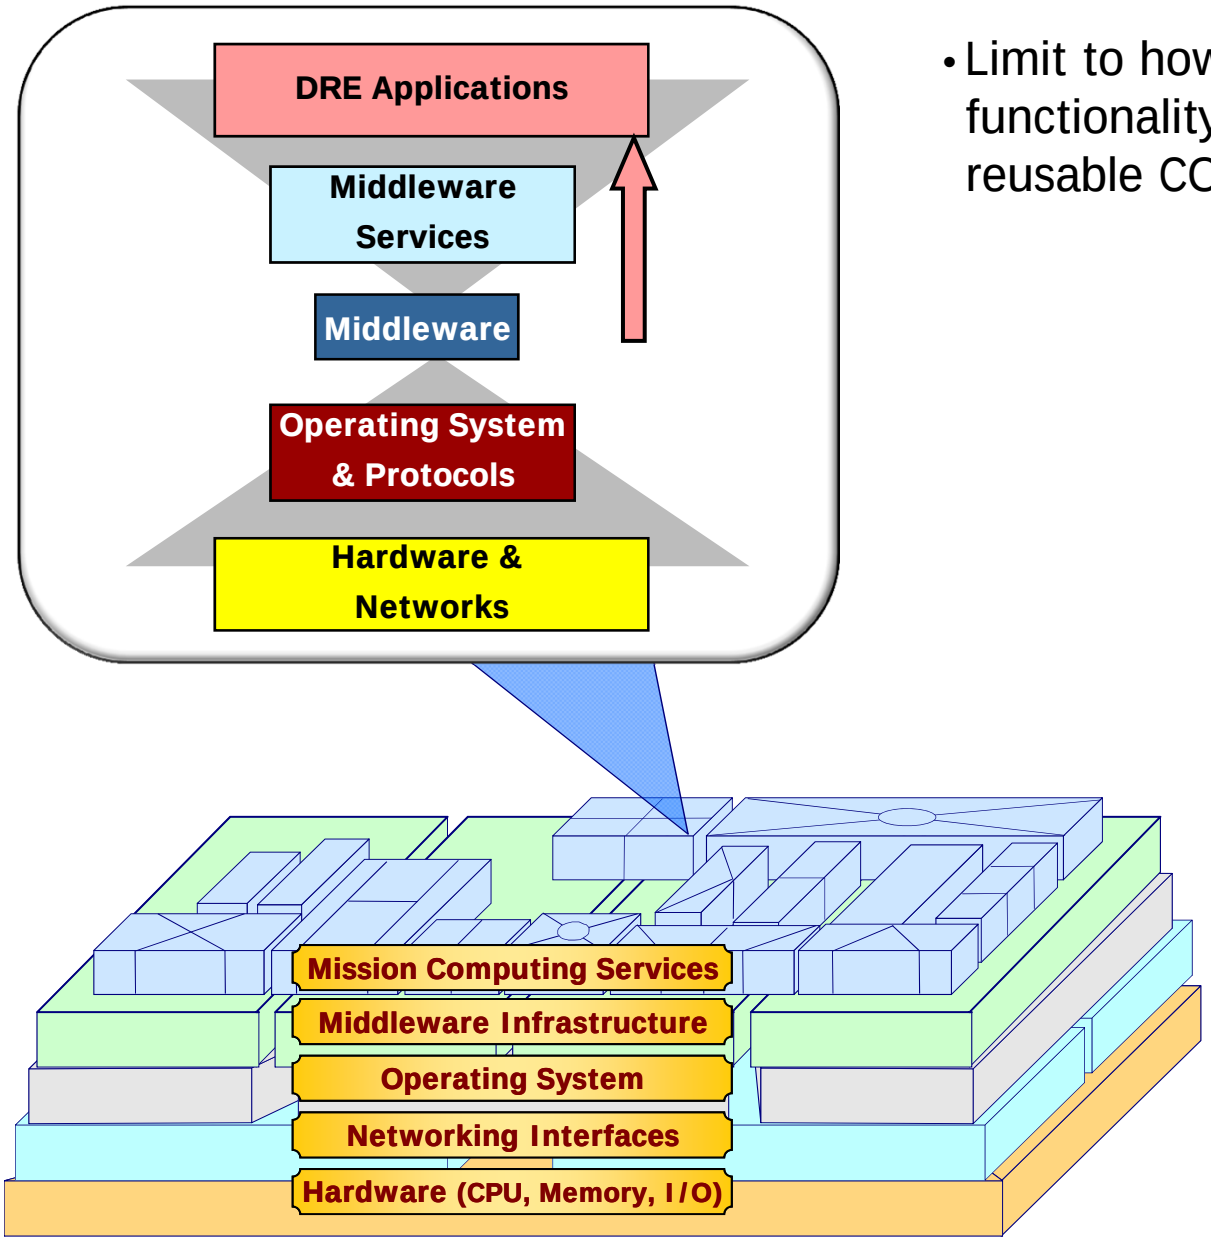
- Creates a standard “virtual boundary” around application component implementations that interact only via well-defined interfaces
- Define standard container mechanisms needed to execute components in generic component servers
- Specify the infrastructure needed to configure & deploy components thruout a distributed system





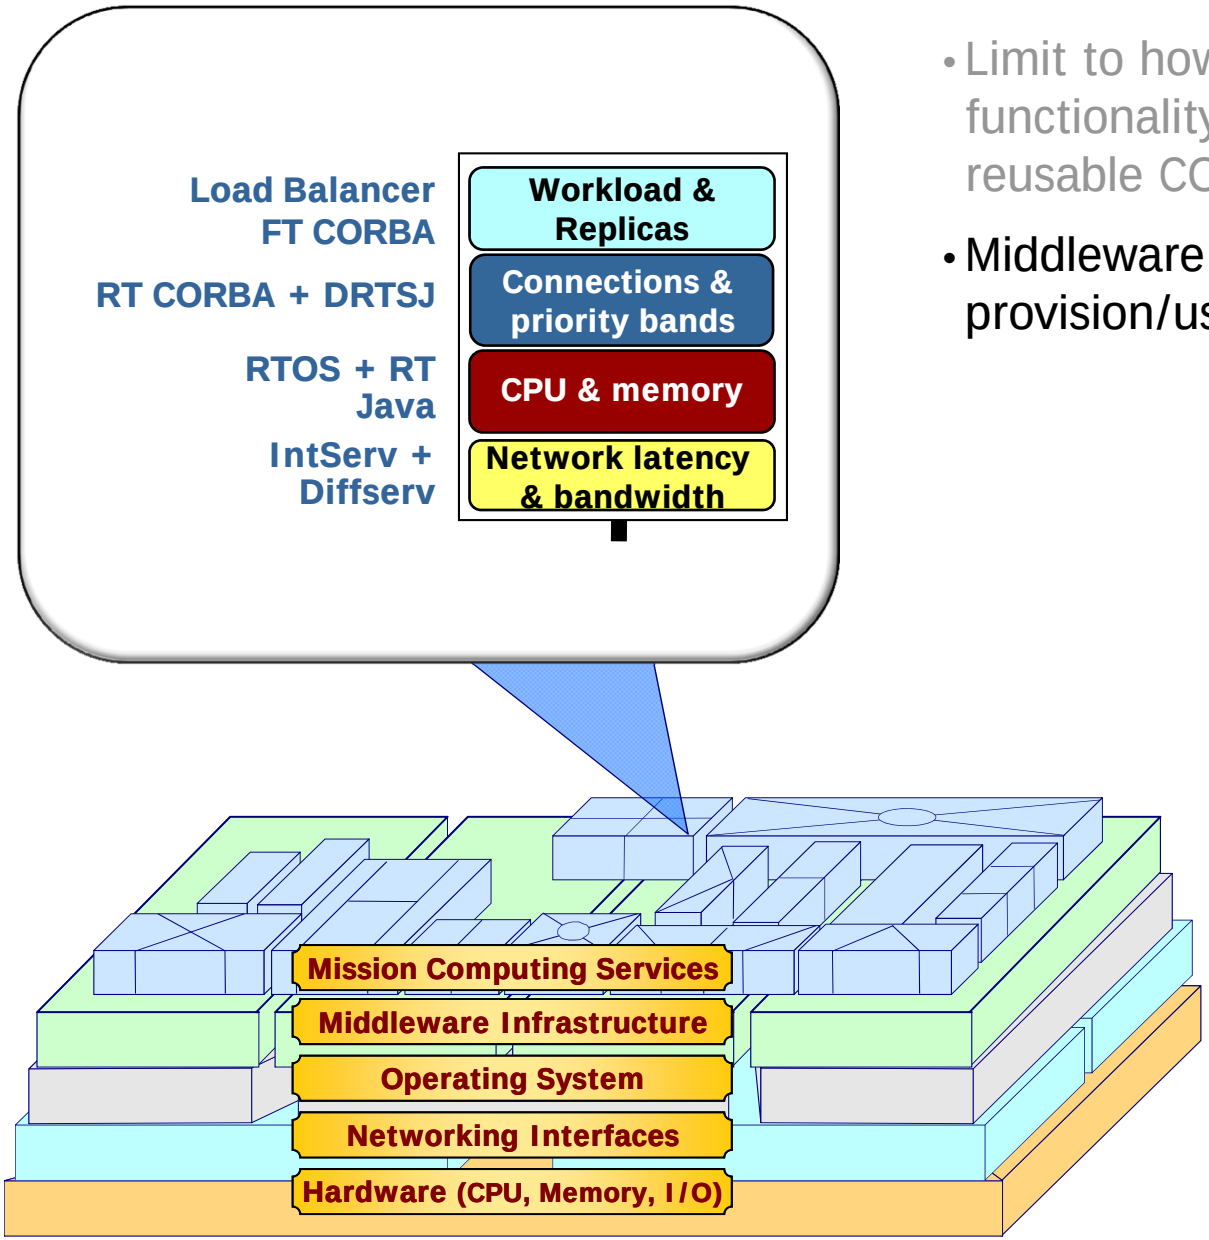
```
<ComponentAssemblyDescription id="a_HUDDisSPLy"> ...
 <connection>
  <name>GPS-RateGen</name>
<internalEndPoint><portName>Refresh</portName><instance>a_GPS</
/instance>
  </internalEndPoint>
  <internalEndPoint>
    <portName>Pulse</portName><instance>a_RateGen</instance>
  </internalEndPoint>
 </connection>
 <connection>
   <name>NavDisSPLy-GPS</name>
<internalEndPoint><portName>Refresh</portName><instance>a_NavDi
sSPLy</instance>
   </internalEndPoint>
<internalEndPoint><portName>Ready</portName><instance>a_GPS</i
nstance>
   </internalEndPoint>
 </connection> ...
</ComponentAssemblyDescription>
```

Limitations of Component Middleware



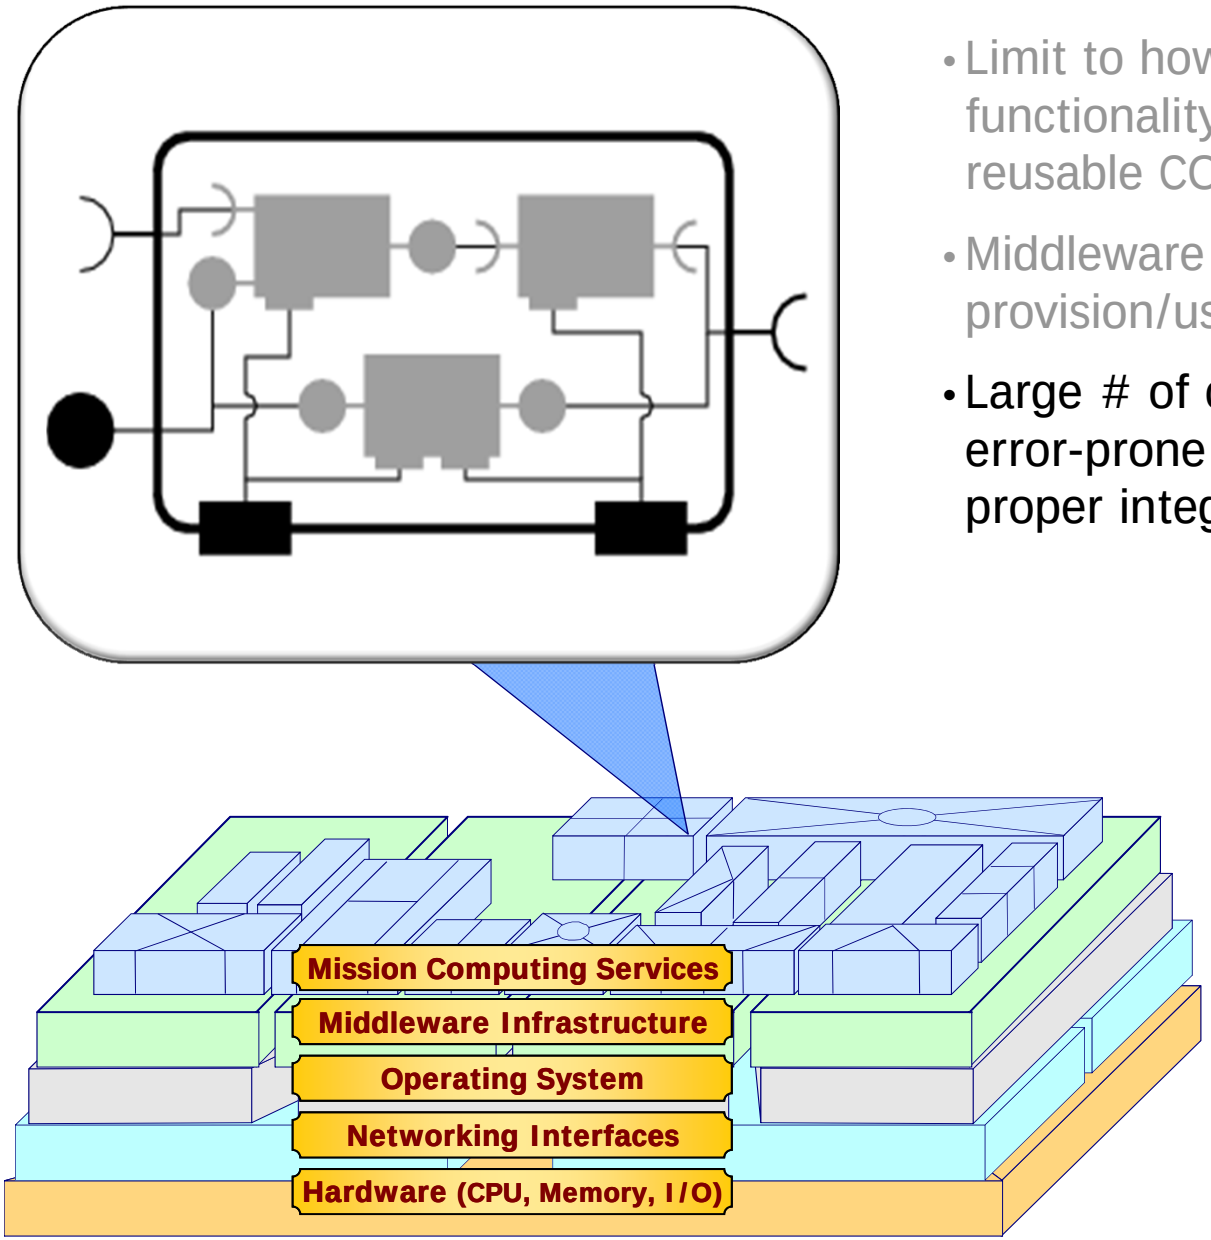
- Limit to how much application functionality can be refactored into reusable COTS component middleware

Limitations of Component Middleware



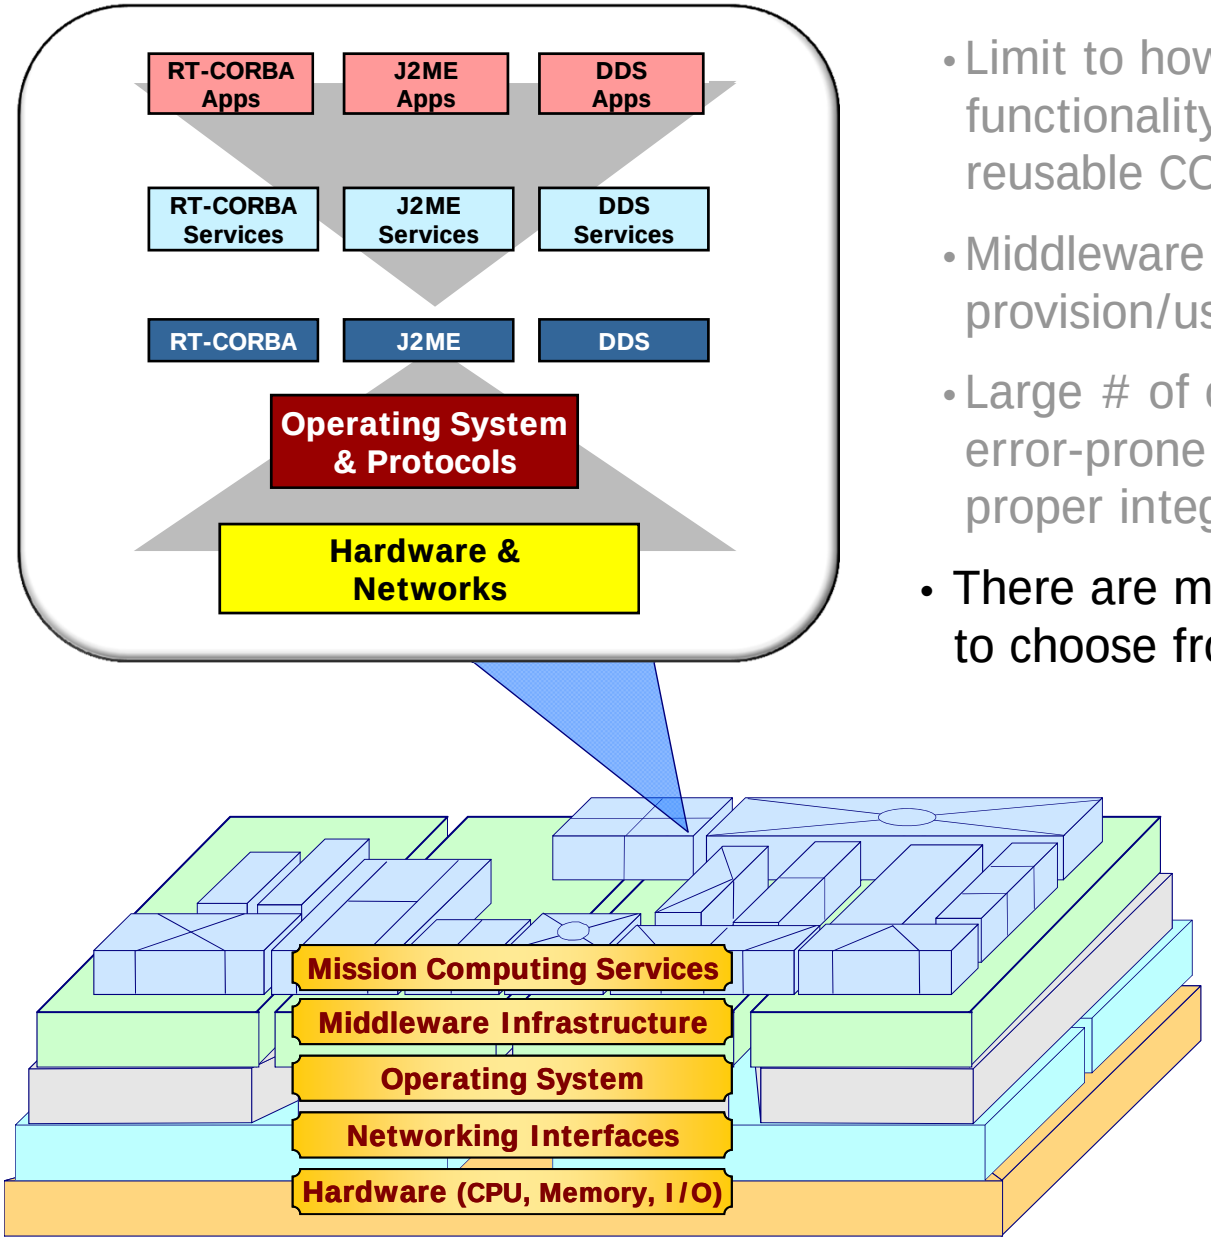
- Limit to how much application functionality can be refactored into reusable COTS component middleware
- Middleware itself has become hard to provision/use

Limitations of Component Middleware



- Limit to how much application functionality can be refactored into reusable COTS component middleware
- Middleware itself has become hard to provision/use
- Large # of components can be tedious & error-prone to configure & deploy without proper integration tool support

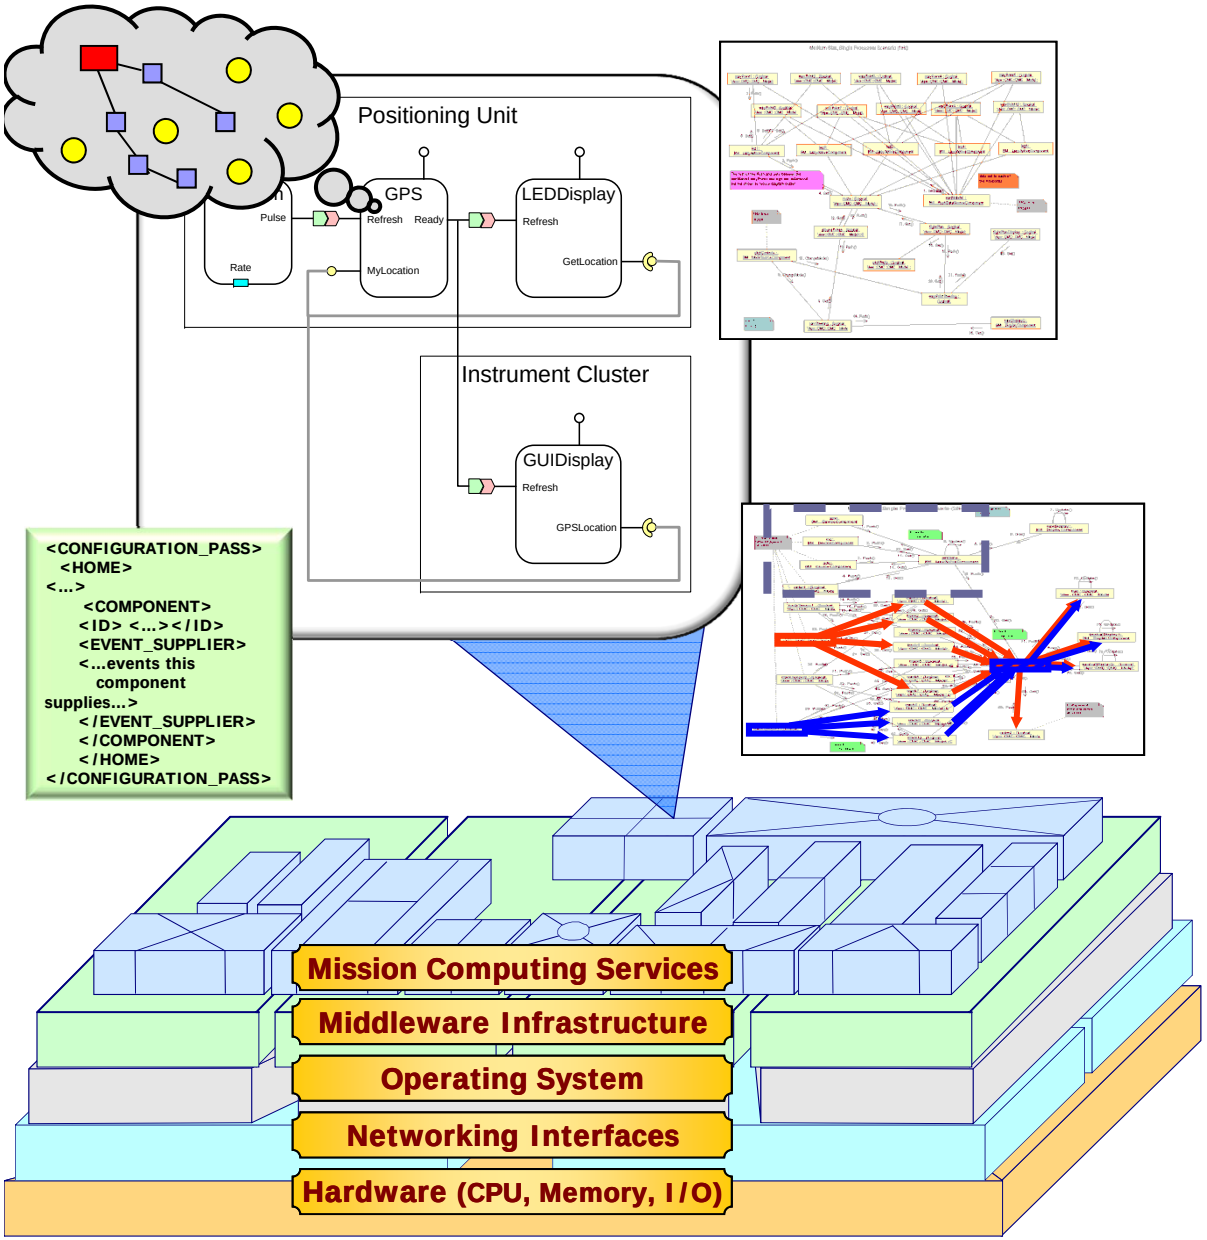
Limitations of Component Middleware



- Limit to how much application functionality can be refactored into reusable COTS component middleware
- Middleware itself has become hard to provision/use
- Large # of components can be tedious & error-prone to configure & deploy without proper integration tool support

- There are many middleware technologies to choose from

Applying MDE to Bold Stroke



Model-driven engineering (MDE)

- Apply MDE tools to
  - Model
  - Analyze
  - Synthesize
  - Provision

  middleware & application components
- Configure product variant-specific component assembly & deployment environments
- Model-based component integration policies

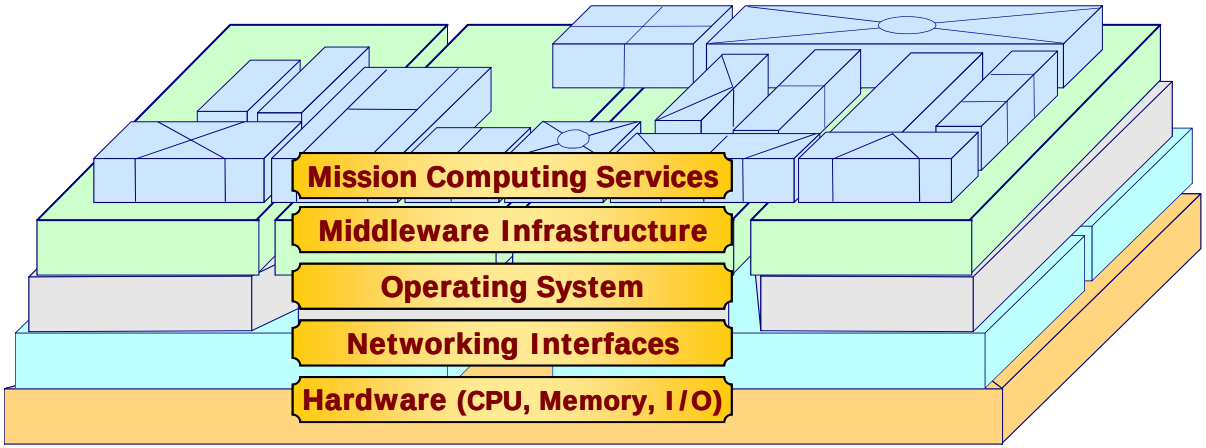
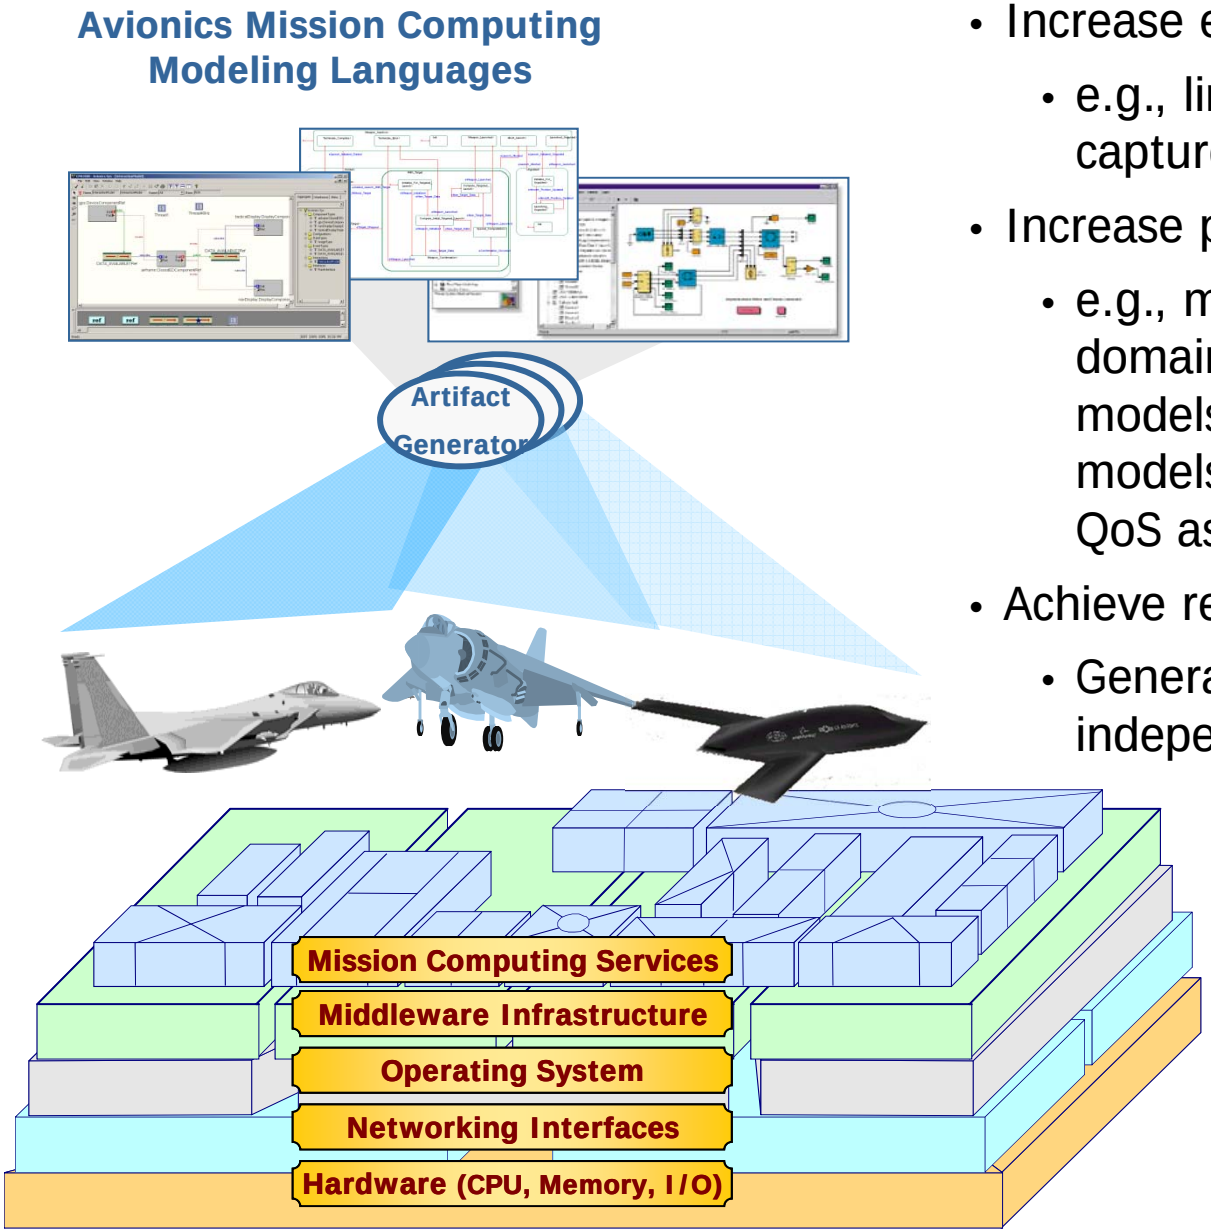
CODE GENERATORS



www.rl.af.mil/tech/programs/MoBIES/

Benefits of MDE



- Increase expressivity
  - e.g., linguistic support to better capture design intent
- Increase precision
  - e.g., mathematical tools for cross-domain modeling, synchronizing models, change propagation across models, modeling security & other QoS aspects
- Achieve reuse of domain semantics
  - Generate code that's more "platform-independent" (or not)!
    - Support DRE system development & evolution

Limitations of MDE

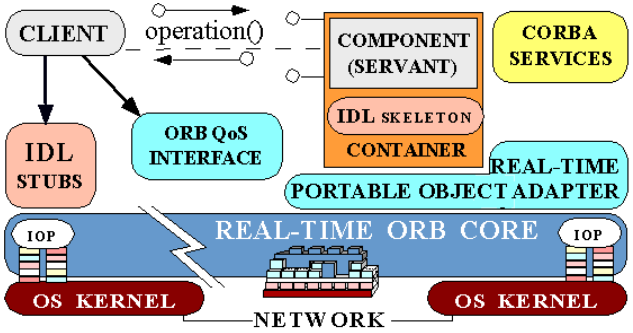
Model & Component Library

- Modeling technologies are still maturing & evolving
  - i.e., non-standard tools
- Magic (& magicians) are still necessary for success

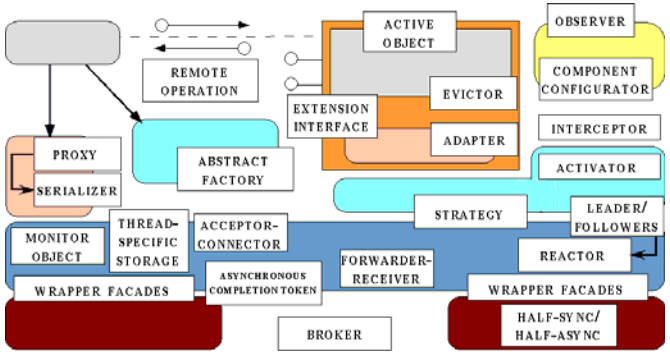
Ingredients for Success with Systematic Reuse

Key Technologies

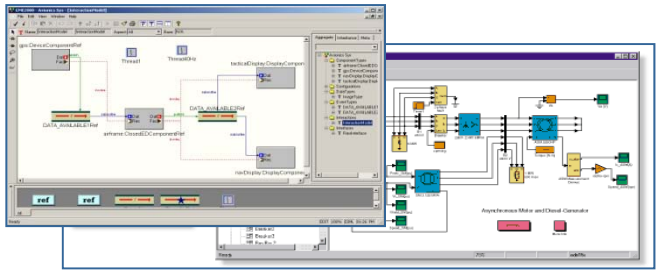
Standard Middleware, Frameworks, & Components



Patterns & Pattern Languages



Model-driven Software Development



Experienced Senior Architects

- Responsible for communicating completeness, correctness, & consistency of all parts of the software architecture to the stakeholders

Solid Key Developers

- Design responsibility (maintenance, evolution) for a specific architectural topic

Enlightened Managers

- Must be willing to defend the sacrifice of some short-term investment for long-term payoff

Accepted Business Drivers

- i.e., need a “succeed or die” mentality

It’s crucial to have an effective process for growing architects & key developers

Traits of Dysfunctional Software Organizations

Process Traits

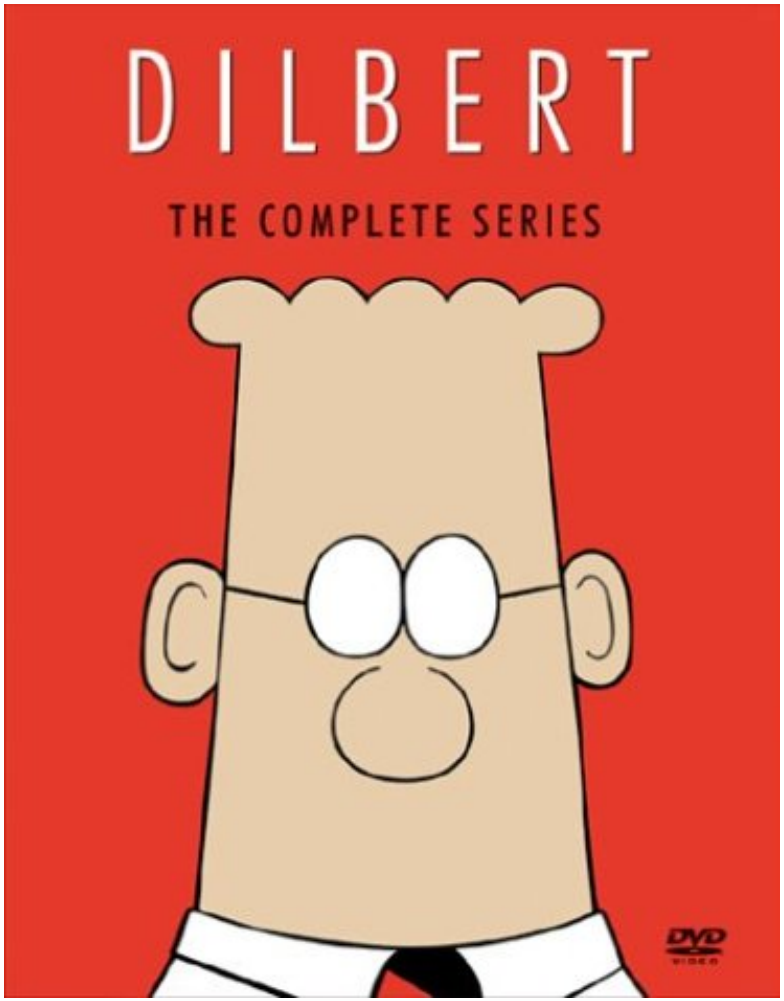
- Death through quality
  - "Process bureaucracy"
- Analysis paralysis
  - "Zero-lines of code seduction"
- Infrastructure churn
  - e. g., programming to low-level APIs

Organizational Traits

- Disrespect for quality developers
  - "Coders vs. developers"
- Top-heavy bureaucracy

Sociological Traits

- The "Not Invented Here" syndrome
- Modern method madness



www.dre.vanderbilt.edu/~schmidt/editorials.html

Traits of Highly Successful Software Organizations

Strong leadership in business & technology

- e.g., understand the role of software technology
- Don’t wait for “silver bullets”

Clear architectural vision

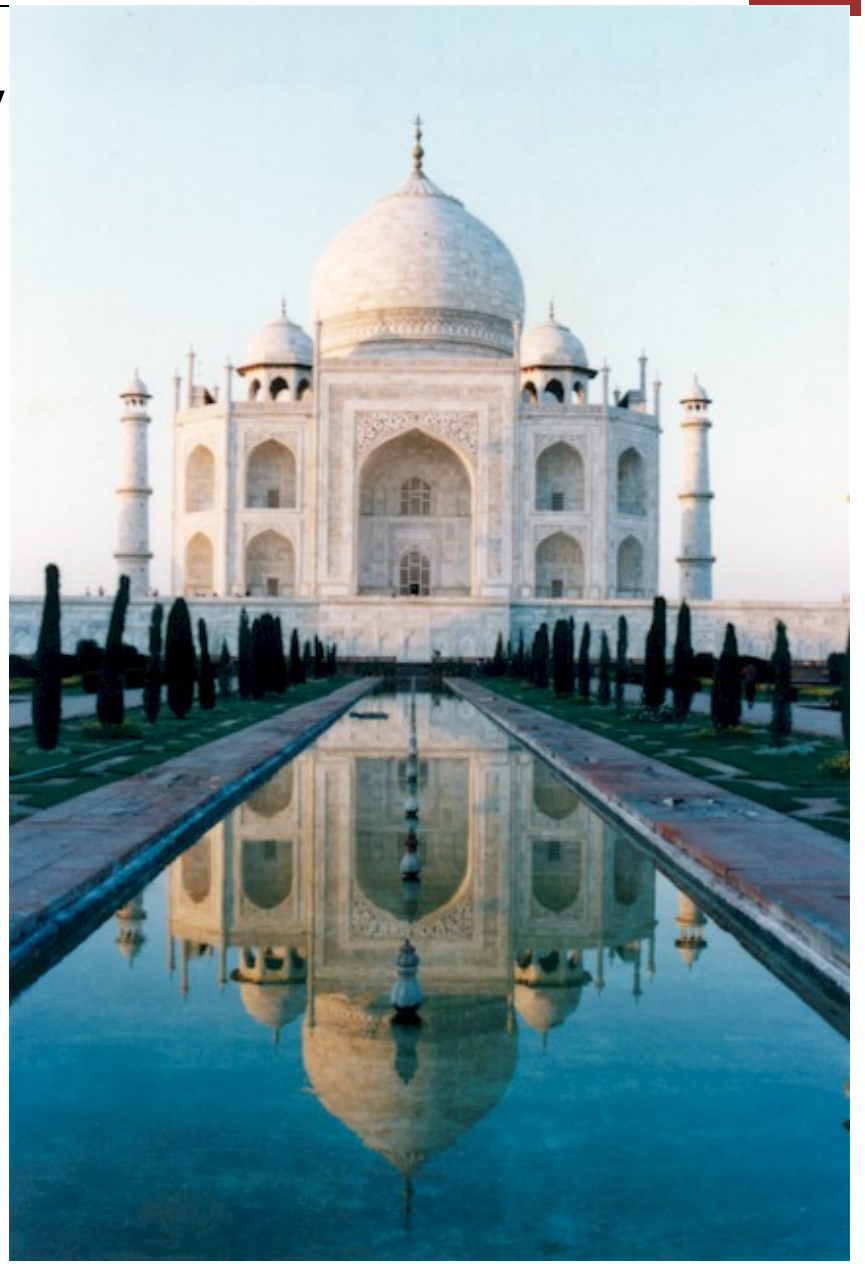
- e.g., know when to buy vs. build
- Avoid worship of specific tools & technologies

Effective use of prototypes & demos

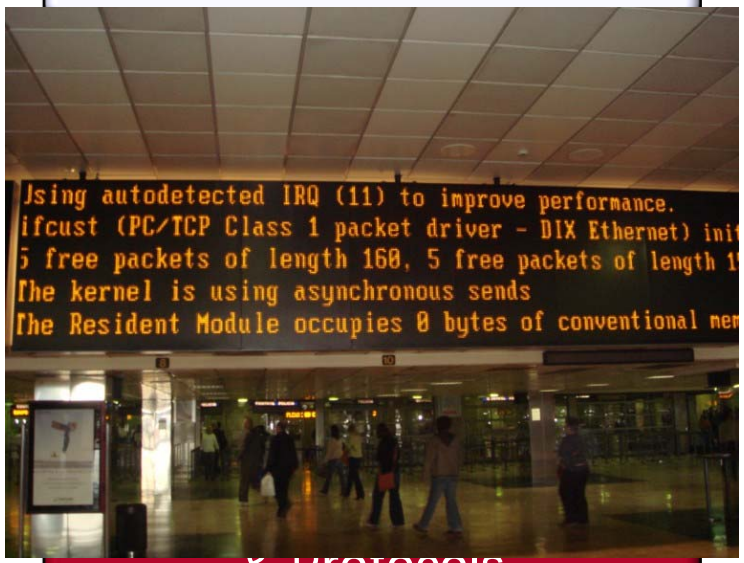
- e.g., reduce risk & get user feedback

Commitment to/from skilled developers

- e.g., know how to motivate software developers & recognize the value of thoughtware



Consequences of COTS & IT Commoditization



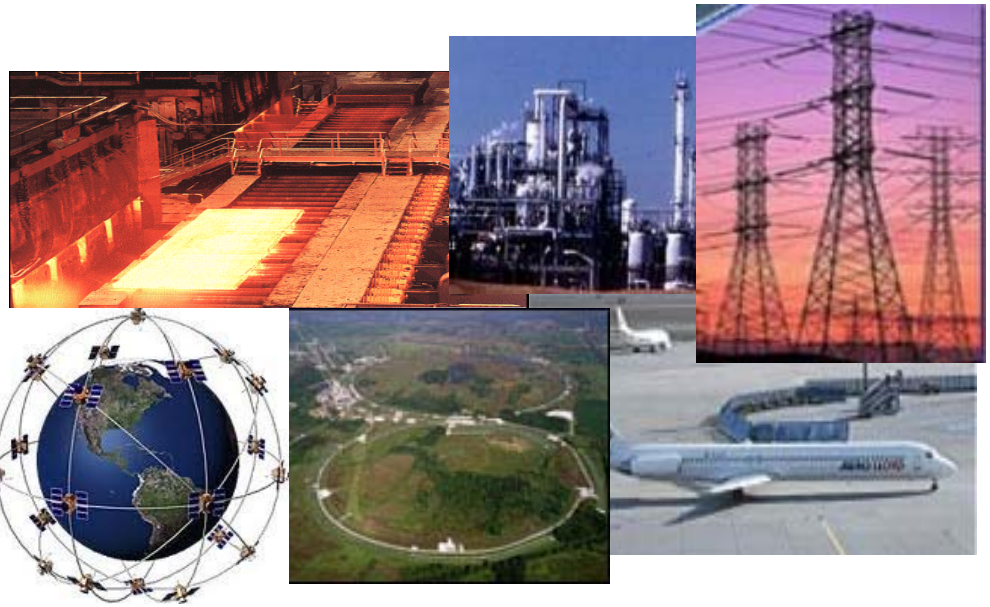
- More emphasis on integration rather than programming
- Increased technology convergence & standardization
- Mass market economies of scale for technology & personnel
- More disruptive technologies & global competition
- Lower priced—but often lower quality—hardware & software components
- The decline of internally funded R&D
- Potential for complexity cap in next-generation complex systems

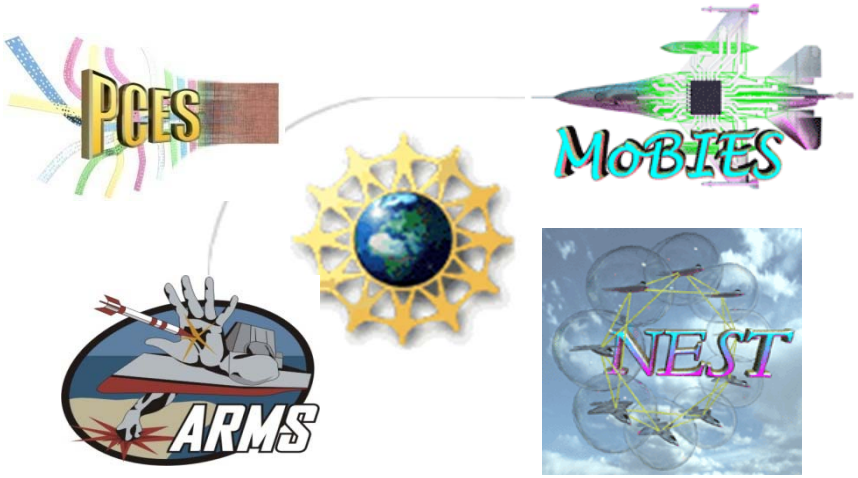
Not all trends bode well for long-term competitiveness of traditional leaders

Ultimately, competitiveness depends on success of long-term R&D on *complex* distributed real-time & embedded (DRE) systems

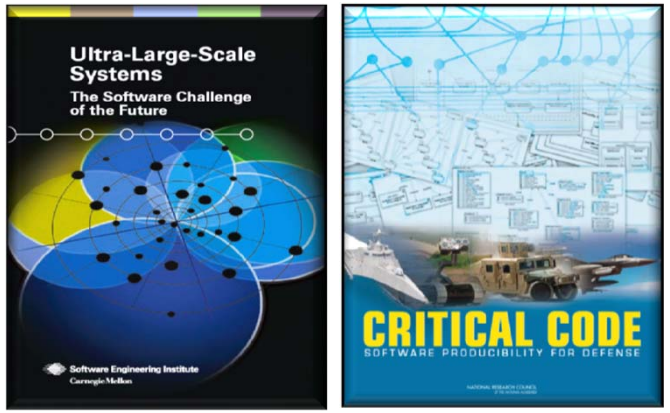
Concluding Remarks

- The growing size & complexity of DRE systems requires significant innovations & advances in processes, methods, platforms, & tools
- Not all technologies provide precision of legacy real-time & embedded systems
- Advances in Model-Driven Engineering & component/SOA-based DRE system middleware are needed to address future challenges
- Significant groundwork laid in DARPA & NSF programs





- Much more R&D needed to assure key quality attributes of DRE systems



See blog.sei.cmu.edu for coverage of SEI R&D activities

Further Reading

ULS systems are socio-technical ecosystems comprised of software-reliant systems, people, policies, cultures, & economics that have unprecedented scale in the following dimensions:

- # of lines of software code & hardware elements
- # of connections & interdependencies
- # of computational elements
- # of purposes & user perception of purposes
- # of routine processes & “emergent behaviors”
- # of (overlapping) policy domains & enforceable mechanisms
- # of people involved in some way
- Amount of data stored, accessed, & manipulated
- ... etc ...

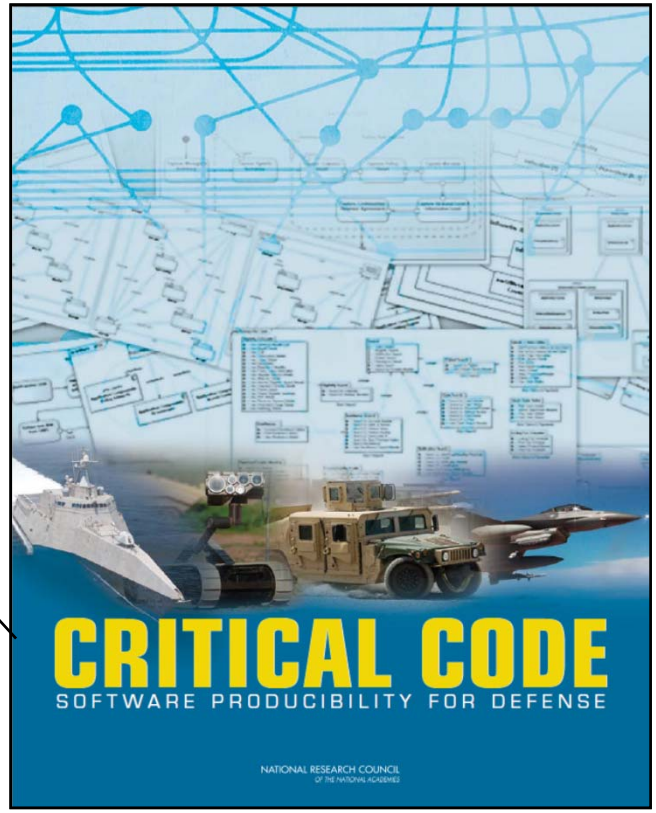
NRC Report *Critical Code: Software Producibility for Defense* (2010)

Focus of the report is on ensuring the DoD has the technical capacity & workforce to design, produce, assure, & evolve innovative software-reliant systems in a predictable manner, while effectively managing risk, cost, schedule, & complexity



Sponsored by Office of the Secretary of Defense (OSD) with assistance from the National Science Foundation (NSF), & Office of Naval Research (ONR), www.nap.edu/openbook.php?record_id=12979&page=R1
