Award # N0001497W-X30052

## **LONG TERM GOALS**

Quantitatively relate the temporal and spatial properties of shallow water acoustic signals to the physical processes which cause the temporal and spatial variability of the propagation channel. Address internal waves, tides, surface gravity wavefields and the heterogeneous ocean bottom/subbottom.

## **SCIENTIFIC OBJECTIVES**

Increase the understanding of the physics of broadband acoustic signal propagation through the random shallow water waveguide.

## **APPROACH**

This research is focused on the analysis of portions of a data set obtained during an interdisciplinary oceanographic and ocean acoustics experiment (SWARM95). The experiment's objective was to increase the basic understanding of the physics of acoustic signal propagation through slope/shelf internal wave fields. The experiment required extensive physical oceanographic measurement to quantify the generation, propagation and decay of those internal wave fields. The experiment was conducted on the New Jersey Shelf during the summer of 1995. The acoustic propagation path was placed on the NSF Ocean Drilling Program Seismic Line 1003. An extensive ONR/NSF geologic and geophysical data set has been developed for this line and is being used to include the effects of the heterogeneous bottom on the acoustic signals. Two acoustics sources (224 Hz and 400 Hz) were placed at a distance of about 37 and 42 km from two vertical receiving arrays. Numerous thermistor arrays, temperature pods and bottom moored ADCPs were placed to monitor the properties of the water column.

## **WORK COMPLETED**

The FY97's effort was focused on: 1) the digitization of 22 days of analog high frequency flow visualization data; 2) the refinement of computer techniques to track internal wave displacement of scattering horizons; 3) the initialization of the

Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

tracking of the scattering horizons; 4) providing sections of the tracked data to colleagues for propagation modeling purposes; and 5) contributing to an article (multi-author outlining the initial results of the SWARM95 experiment).

## **RESULTS**

The primary focus of the experiment was to measure the statistical and deterministic properties of the shelf internal wave field and relate those properties to the coherence, range dependent scintillation index and time fluctuation properties of the acoustic signals.

Digitized acoustic flow visualization data have been used to perturb the range dependent sound speed field interpolated from tow-yo CTD data taken along the acoustic propagation track. Broadband acoustic signals numerically propagated through this sound speed profile were compared to data.

Simulated signal characteristics were comparable to data only if the internal wave influence was included in the sound speed field. The calculations were done using inhomogeneous and rough bottom/subbottom viscoelastic parameters extracted from Chirp subbottom profile data (work done by Altan Turgut, NRL) taken during the experiment.

## **IMPACT ON/APPLICATIONS**

Results will permit the prediction of ASW system performance in shallow water propagation channels randomized by internal wave fields.

## **TRANSITIONS**

Presentations to ONR, PEO-ASTO-USW

## **RELATED PROJECTS**

This research effort is a collaborative effort between Dr. James Lynch and associates from the Woods Hole Oceanographic Institution; Dr. John Apel, Ocean Associates Inc.; Dr. Mohsen Badiy, The University of Delaware; Dr. C. S. Chiu, the NPGS; and scientists at the Naval Research Laboratory. Results reported represent the efforts of several members of this team of scientists. The research effort is supported by ONR.
