Conclusion

Discussion

Software Architecture: Common Ideas

A software architecture is a “first-cut” at designing the system and solving the problem or fitting the need.

A software architecture is an ad hoc box-and-line drawing of the system that is intended to solve the problems articulated by the specification.

- Boxes define the elements or “parts” of the system.
- Lines define the interactions or between the parts.

Our Definition of Software Architecture

“The software architecture of a program or computing system is the structure or structures of the system, which comprise software elements, the externally visible properties of those elements, and the relationships among them.”

Bass L.; Clements P.; Kazman R. *Software Architecture in Practice* 2nd Edition Reading, MA: Addison-Wesley, 2003.

Implications of Our Definition

Architecture is an abstraction of a system.

Systems can and do have many structures.

Every system *has* an architecture.

Just having an architecture is different from having an architecture that is known to everyone.

If you don't explicitly develop an architecture, you will get one anyway – *and you might not like what you get!*

Why is Software Architecture Important?

Represents *earliest* design decisions

- hardest to change
- most critical to get right
- communication vehicle among stakeholders

First design artifact addressing

- performance
- modifiability
- reliability
- security

Key to systematic *reuse*

- transferable, reusable abstraction

The **right architecture** paves the way for system **success**.
The **wrong architecture** usually spells some form of **disaster**.

Conclusion

Discussion

Requirements Beget Design

Software System Development

If function were all that mattered, any monolithic software would do, *..but other things matter...*

The important quality attributes and their characterizations are key.

System Qualities and Software Architecture

Architecture and Functionality

Functionality is largely orthogonal to quality attribute requirements.

- Functionality is the ability of a system to do the work it was intended to do.
- Systems are decomposed into elements to achieve a variety of purposes other than function.
 - Architectural choices promote certain qualities as well as implement the desired functionality.

Effects of Architectural Decisions on Quality Attributes

The degree to which a system meets its quality attribute requirements is dependent on architectural decisions.

- A change in structure improving one quality often affects the other qualities.
- Architecture is critical to the realization of quality attributes.
- These product qualities should be designed into the architecture.
- Architecture can only permit, not guarantee, any quality attribute.

Challenges

What precisely do these quality attributes such as modifiability, security, performance, and reliability mean?

How do you architect to ensure the system will have its desired qualities?

Can a system be analyzed to determine these desired qualities?

How soon can such an analysis occur?

How do you know if software architecture for a system is suitable without having to build the system first?

Quality Attribute Scenarios – 1

A solution to the problem of describing quality attributes is to use quality attribute scenarios as a means to better characterize quality attributes.

A quality attribute scenario consists of six parts.

Quality Attribute Scenarios – 2

1. **stimulus** – a condition that affects the system
2. **response** – the activity that results because of the stimulus
3. **source of the stimulus** – the entity that generated the stimulus
4. **environment** – the condition under which the stimulus occurred
5. **artifact stimulated** – the artifact that was stimulated by the stimulus
6. **response measure** – the measure by which the system's response will be evaluated

Parts of a Quality Attribute Scenario

Carnegie Mellon
Software Engineering Institute

General and Concrete Scenarios

General scenarios

- are those scenarios that are system independent
- represent quality attribute characterizations
- can be used to create **concrete scenarios** that are specific to a particular system.

General six-part scenarios exist for

- availability
- modifiability
- performance
- security
- testability
- usability

Modifiability – 1

Definition: *Modifiability is about the cost of change and refers to the ease with which a software system can accommodate changes.*

Areas of concern include

- identifying what can change
 - functions, platforms, hardware, operating systems, middleware, systems it must operate with, protocols, and so forth
 - quality attributes: performance, reliability, future modifiability, and so forth
- When will the change be made and who will make it?

Modifiability – 2

General scenario considerations:

Source	End user, developer, system administrator
Stimulus	Add/delete/modify functionality or quality attribute
Environment	Runtime, compile time, build time, design time
Artifacts	System: user interface, platform, environment, system that interoperates with target system

Modifiability – 3

General scenario considerations (continued):

Response	• Locate places in the architecture to be modified. • Make modifications without affecting other functionality. • Test the modification with minimal effort. • Deploy the modification with minimal effort.
Response Measure	• Cost in terms of the number of affected components, effort, and money • Extent to which this modification affects other functions and/or quality attributes

Sample Modifiability Scenario

A developer wishes to change the user interface (UI) code at design time. The modification is made with no side effects, in three hours.

Source	Developer
Stimulus	Wishes to change the UI
Artifact	Code
Environment	At design time
Response	Modification is made with no side effects
Response Measure	In three hours

The Reality About Software Architecture.

Quality attribute requirements are the primary drivers for architectural design.

The degree to which a system meets its quality attribute requirements is dependent on architectural decisions.

Software development needs to be driven by architectural decisions.

Architecture-centric development is key.

Carnegie Mellon
Software Engineering Institute

What is architecture-centric development?

Architecture-centric development involves

- Creating the business case for the system
- Understanding the requirements
- Creating or selecting the architecture
- Documenting and communicating the architecture
- Analyzing or evaluating the architecture
- Implementing the system based on the architecture
- Ensuring that the implementation conforms to the architecture
- Maintaining the architecture

The architecture must be both prescriptive and descriptive.

Influence of System Stakeholders - 1

Stakeholders have an interest in the construction of a software system. Stakeholders might include

- customers
- users
- developers
- project managers
- marketers
- maintainers

Stakeholders have different concerns that they wish to guarantee and/or optimize.

Influence of System Stakeholders – 2

Stakeholder Involvement

The organizational goals and the system properties required by the business are rarely understood, let alone fully articulated.

Customer quality attribute requirements are seldom documented, which results in

- goals not being achieved
- inevitable conflict between different stakeholders

Architects must identify and actively engage stakeholders in order to

- understand real constraints of the system
- manage the stakeholders' expectations
- negotiate the system's priorities
- make tradeoffs

Software architecture

Detailed design
Implementation

Quality attributes are rarely captured in requirements specifications.

- *often vaguely understood*
- *often weakly articulated*

Quality Attribute Workshop

The Quality Attribute Workshop (QAW) is a facilitated method that engages system stakeholders early in the lifecycle to discover the driving quality attributes of a software intensive system.

Key points about the QAW are that it is

- system centric
- scenario based
- stakeholder focused
- used before the software architecture has been created

Quality Attribute Workshop Steps

1. Introductions and QAW Presentation
2. Business/Mission Presentation
3. Architecture Plan Presentation
4. Identify Architectural Drivers
5. Scenario Brainstorming
6. Scenario Consolidation
7. Scenario Prioritization
8. Scenario Refinement

Iterate as necessary with broader stakeholder community

QAW Benefits and Next Steps

Potential Benefits

- Increased stakeholder communication
- Clarified quality attribute requirements
- Informed basis for architectural decisions

Carnegie Mellon
Software Engineering Institute

What Is Architecture-centric Development?

Architecture-centric development involves

- Creating the business case for the system
- Understanding the requirements
- **Creating or selecting the architecture**
- Documenting and communicating the architecture
- Analyzing or evaluating the architecture
- Implementing the system based on the architecture
- Ensuring that the implementation conforms to the architecture
- Maintaining the architecture

The architecture must be both prescriptive and descriptive.

Creating the Software Architecture

There are architecture definition methods and guidelines, many of which focus exclusively on the functional requirements.

It is possible to create an architecture based on the quality architectural drivers.

One way to approach this is to use architectural tactics and patterns and a method that capitalizes on both.

Tactics

The design for a system consists of a collection of design decisions.

- Some decisions are intended to ensure the achievement of the functionality of the system.
- Other decisions are intended to help control the quality attribute responses.

These decisions are called *tactics*.

- A tactic is a design decision that is influential in the control of a quality attribute response.
- A collection of tactics is an *architectural strategy*.

Tactics Catalog

Tactics have been defined for the following quality attributes:

- Performance
- Availability
- Maintainability
- Usability
- Testability
- Security

Others are in the works.

Performance Tactics

Summary of performance tactics

Attribute-Driven Design

The Attribute-Driven Design (ADD) method, developed at the SEI, is an approach to defining a software architecture that bases the decomposition process on the quality attributes the software must fill.

It follows a recursive decomposition process where, at each stage in the decomposition, tactics and architectural patterns are chosen to satisfy a set of quality scenarios.

Evolutionary Delivery Life Cycle

ADD Method's Inputs and Outputs

Inputs

- constraints
- functional requirements
- quality attribute requirements

Outputs

- first several levels of module decomposition
- various other views of the system as appropriate
- set of elements for functionality and the interactions among them

Carnegie Mellon
Software Engineering Institute

What Is Architecture-centric Development?

Architecture-centric development involves

- Creating the business case for the system
- Understanding the requirements
- Creating or selecting the architecture
- Documenting and communicating the architecture
- Analyzing or evaluating the architecture
- Implementing the system based on the architecture
- Ensuring that the implementation conforms to the architecture
- Maintaining the architecture

The architecture must be both prescriptive and descriptive.

Importance of Architecture Documentation

Architecture documentation is important if and only if *communication* of the architecture is important.

- How can an architecture be used if it cannot be understood?
- How can it be understood if it cannot be communicated?

Documenting the architecture is the crowning step to creating it.

Documentation speaks for the architect, today and 20 years from today.

Seven Principles of Sound Documentation

Certain principles apply to all documentation, not just documentation for software architectures.

1. Write from the point of view of the reader.
2. Avoid unnecessary repetition.
3. Avoid ambiguity.
4. Use a standard organization.
5. Record rationale.
6. Keep documentation current but not too current.
7. Review documentation for fitness of purpose.

Views

A view is a representation of a set of system elements and the relations associated with them.

Not *all* system elements, *some* of them.

A view binds an *element type* and *relation type* of interest, and illustrates them.

View-Based Documentation

Views give us our basic principle of architecture documentation:

Documenting a software architecture is a matter of documenting the relevant views, and then adding information that applies to more than one view.

Which Views Are Relevant?

Which views are relevant? It depends on

- who the stakeholders are
- how they will use the documentation

Three primary uses for architecture documentation are

1. education - introducing people to the project
2. communication - among stakeholders
3. analysis - assuring quality attributes

Carnegie Mellon
Software Engineering Institute

What Is Architecture-centric Development?

Architecture-centric development involves

- Creating the business case for the system
- Understanding the requirements
- Creating or selecting the architecture
- Documenting and communicating the architecture
- **Analyzing or evaluating the architecture**
- Implementing the system based on the architecture
- Ensuring that the implementation conforms to the architecture
- Maintaining the architecture

The architecture must be both prescriptive and descriptive.

Traditional System Development

Software architecture

Detailed design
Implementation

A Critical leap!

*How do you know if the
architecture
is fit for purpose?*

Why Evaluate Architectures?

All design involves tradeoffs.

A software architecture is the earliest life-cycle artifact that embodies significant design decisions and tradeoffs.

- The earlier that risks are identified, the earlier that mitigation strategies can be developed potentially avoid the risks altogether.
- The earlier that defects are found, the less it costs to remove them.

Carnegie Mellon
Software Engineering Institute

SEI's Architecture Tradeoff Analysis MethodSM (ATAM)SM

ATAM is an architecture evaluation method that

- focuses on multiple quality attributes
- illuminates points in the architecture where quality attribute *tradeoffs* occur
- generates a context for ongoing quantitative analysis
- utilizes an architecture's vested stakeholders as authorities on the quality attribute goals

The ATAMSM

The SEI has developed the Architecture Tradeoff Analysis MethodSM (ATAMSM).

The purpose of ATAM is: *to assess the consequences of architectural decisions in light of quality attribute requirements and business goals.*

Purpose of ATAM – 1

The ATAM is a method that helps stakeholders ask the right questions to discover potentially problematic architectural decisions

Discovered risks can then be made the focus of mitigation activities: e.g. further design, further analysis, prototyping.

Surfaced tradeoffs can be explicitly identified and documented.

Purpose of ATAM – 2

The purpose of the ATAM is **NOT** to provide precise analyses . . . the purpose **IS** to discover risks created by architectural decisions.

We want to find *trends*: correlation between architectural decisions and predictions of system properties.

ATAM Phases

ATAM evaluations are conducted in four phases.

ATAM Steps

1. Present the ATAM
2. Present business drivers
3. Present architecture

4. Identify architectural approaches
5. Generate quality attribute utility tree
6. Analyze architectural approaches

7. Brainstorm and prioritize scenarios
8. Analyze architectural approaches

9. Present results

Example Utility Tree

Conceptual Flow of the ATAMSM

When to Use the ATAM

The ATAM can be used throughout the life cycle *when there is a software architecture to evaluate*.

The ATAM can be used

- after an architecture has been specified but there is little or no code
- to evaluate architectural alternatives
- to evaluate the architecture of an existing system

To perform an ATAM evaluation, *there must be a software architecture to evaluate*.

- An ATAM evaluation is inappropriate if the software architecture of the system has not been created yet.

ATAM Benefits

The benefits of performing ATAM evaluations include

- clarified quality attribute requirements
- improved architecture documentation
- documented basis for architectural decisions
- identification of risks early in the life cycle
- increased communication among stakeholders

The result is improved architectures.

Architecture Evaluation Experience

Benefits of early architecture evaluations

- Evaluations using the Architecture Tradeoff Analysis MethodSM (ATAMSM) uncover an average 20 risks per two-day evaluation. Experience over a wide range of domains attributes these risks to
 - unknowns (requirements, hardware, COTS)
 - side effects of architectural decisions
 - improper architectural decisions
 - interactions with other organizations that provide system components
- Evaluations performed by AT&T have resulted in 10% productivity increase per project

SEI Software Architecture Curriculum

Six courses

- Software Architecture: Principles and Practices
- Documenting Software Architectures
- Software Architecture Design and Analysis
- Software Product Lines
- ATAM Evaluator Training
- ATAM Facilitator Training

Three certificate programs

- Software Architecture Professional
- ATAM Evaluator
- ATAM Lead Evaluator

Coming in 2005: SEI Software Product Line Curriculum

About the Curriculum

Software professionals can take individual courses based on specific needs or interests or complete one or more of the following three specially designed **certificate programs**:

- **Software Architecture Professional**
- **ATAMSM Evaluator**
- **ATAMSM Lead Evaluator**

The ATAM certificate programs qualify individuals to perform or lead SEI-authorized ATAM evaluations.

Certificate Program Course Matrix

ATAM Lead Evaluator: 5 Courses & Coaching				
Software Architecture Professional: 4 Courses	Software Architecture: Principles and Practices	Documenting Software Architectures	Software Architecture Design and Analysis	Software Product Lines
	ATAM Evaluator Training	ATAM Facilitator Training	ATAM Coaching	
	ATAM Evaluator 2 courses			

About all the Courses

All of the courses are two-day learning experiences that involve lectures and exercises.

The materials provided include books and class lecture slides.

Prerequisites are enforced.

Any of the courses can also be scheduled for on site delivery.

SEI Software Architecture Workshop for Educators

August 16-18, 2004
Pittsburgh, PA

The Software Architecture Workshop for Educators is a three-day forum for sharing SEI software architecture technology with educators and for jointly determining ways to incorporate these concepts and methods into academic courses.

Schedule: Aug 16-17: Software Architecture: Principles
and Practices Course
Aug 18: Facilitated Discussion

Presentation Outline

Background

Software Architecture

Software Architecture Practices

Related Innovative Practices

SEI Software Architecture Support

Conclusion

Discussion

Architecture Principles

Software architecture is important because it

- provides a communication vehicle among stakeholders
- is the result of the earliest design decisions
- is a transferable, reusable abstraction of a system

The degree to which a system meets its quality attribute requirements is dependent on architectural decisions.

Every software-intensive system *has* a software architecture. Just having an architecture is different from having an architecture that is known to everyone, much less one that is fit for the system's intended purpose.

An architecture-centric approach is critical to achieving and implementing an appropriate architecture.

Carnegie Mellon
Software Engineering Institute

SEI Unique Contribution

The SEI work in software architecture technology and its associated methods are **notably unique** in their

- explicit focus on quality attributes
- direct linkage to business and mission goals
- explicit involvement of system stakeholders
- high-quality published materials for practitioner consumption
- grounding in state-of-the-art quality attribute models and reasoning frameworks

The Total Picture

The Total Picture

Conclusion

Software architecture is critical to achieving key product qualities.

Software architecture, product line practices, and predictable component practices hold great potential for achieving business and mission goals in the development of software-intensive systems.
