20. ABSTRACT (*Continue on reverse side if necessary and identify by block number*)

The TPRC Data Series published in 13 volumes plus a Master Index volume constitutes a permanent and valuable contribution to science and technology. This 17,000 page Data Series should form a necessary acquisition to all scientific and technological libraries and laboratories. These volumes contain an enormous amount of data and information for thermophysical properties on more than 5,000 different materials of interest to researchers in government laboratories and the defense industrial establishment.

"In this work, when it shall be found that much is omitted, let it not be forgotten that much likewise is performed..."

SAMUEL JOHNSON, A.M.

From last paragraph of Preface to his two-volume *Dictionary of the English Language*, Vol. I, page 5, 1755, London, Printed by Strahan.

Foreword

In 1957, the Thermophysical Properties Research Center (TPRC) of Purdue University, under the leadership of its founder, Professor Y. S. Touloukian, began to develop a coordinated experimental, theoretical, and literature review program covering a set of properties of great importance to science and technology. Over the years, this program has grown steadily, producing bibliographies, data compilations and recommendations, experimental measurements, and other output. The series of volumes for which these remarks constitute a foreword is one of these many important products. These volumes are a monumental accomplishment in themselves, requiring for their production the combined knowledge and skills of dozens of dedicated specialists. The Thermophysical Properties Research Center deserves the gratitude of every scientist and engineer who uses these compiled data.

The individual nontechnical citizen of the United States has a stake in this work also, for much of the science and technology that contributes to his well-being relies on the use of these data. Indeed, recognition of this importance is indicated by a mere reading of the list of the financial sponsors of the Thermophysical Properties Research Center; leaders of the technical industry of the United States and agencies of the Federal Government are well represented.

Experimental measurements made in a laboratory have many potential applications. They might be used, for example, to check a theory, or to help design a chemical manufacturing plant, or to compute the characteristics of a heat exchanger in a nuclear power plant. The progress of science and technology demands that results be published in the open literature so that others may use them. Fortunately for progress, the useful data in any single field are not scattered throughout the tens of thousands of technical journals published throughout the world. In most fields, fifty percent of the useful work appears in no more than thirty or forty journals. However, in the case of TPRC, its field is so broad that about 100 journals are required to yield fifty percent. But that other fifty percent! It is scattered through more than 3500 journals and other documents, often items not readily identifiable or obtainable. Nearly 50,000 references are now in the files.

Thus, the man who wants to use existing data, rather than make new measurements himself, faces a long and costly task if he wants to assure himself that he has found all the relevant results. More often than not, a search for data stops after one or two results are found—or after the searcher decides he has spent enough time looking. Now with the appearance of these volumes, the scientist or engineer who needs these kinds of data can consider himself very fortunate. He has a single source to turn to; thousands of hours of search time will be saved, innumerable repetitions of measurements will be avoided, and several billions of dollars of investment in research work will have been preserved.

However, the task is not ended with the generation of these volumes. A critical evaluation of much of the data is still needed. Why are discrepant results obtained by different experimentalists? What undetected sources of systematic error may affect some or even all measurements? What value can be derived as a "recommended" figure from the various conflicting values that may be reported? These questions are difficult to answer, requiring the most sophisticated judgment of a specialist in the field. While a number of the volumes in this Series do contain critically evaluated and recommended data, these are still in the minority. The data are now being more intensively evaluated by the staff of TPRC as an integral part of the effort of the National Standard Reference Data System (NSRDS). The task of the National Standard Reference Data System is to organize and operate a comprehensive program to prepare compilations of critically evaluated data on the properties of substances. The NSRDS is administered by the National Bureau of Standards under a directive from the Federal Council for Science and Technology, augmented by special legislation of the Congress of the United States. TPRC is one of the national resources participating in the National Standard Reference Data System in a united effort to satisfy the needs of the technical community for readily accessible, critically evaluated data.

As a representative of the NBS Office of Standard Reference Data, I want to congratulate Professor Touloukian and his colleagues on the accomplishments represented by this Series of reference data books. Scientists and engineers the world over are indebted to them. The task ahead is still an awesome one and I urge the nation's private industries and all concerned Federal agencies to participate in fulfilling this national need of assuring the availability of standard numerical reference data for science and technology.

EDWARD L. BRADY
Associate Director for Information Programs
National Bureau of Standards

Preface

Thermophysical Properties of Matter, the TPRC Data Series, is the culmination of twelve years of pioneering effort in the generation of tables of numerical data for science and technology. It constitutes the restructuring, accompanied by extensive revision and expansion of coverage, of the original *TPRC Data Book*, first released in 1960 in loose-leaf format, 11"×17" in size, and issued in June and December annually in the form of supplements. The original loose-leaf *Data Book* was organized in three volumes: (1) metallic elements and alloys, (2) nonmetallic elements, compounds, and mixtures which are solid at N.T.P., and (3) nonmetallic elements, compounds, and mixtures which are liquid or gaseous at N.T.P. Within each volume, each property constituted a chapter.

Because of the vast proportions the *Data Book* began to assume over the years of its growth and the greatly increased effort necessary in its maintenance by the user, it was decided in 1967 to change from the loose-leaf format to a conventional publication. Thus, the December 1966 supplement of the original *Data Book* was the last supplement disseminated by TPRC.

While the manifold physical, logistic, and economic advantages of the bound volume over the loose-leaf oversize format are obvious and welcome to all who have used the unwieldy original volumes, the assumption that this work will no longer be kept on a current basis because of its bound format would not be correct. Fully recognizing the need of many important research and development programs which require the latest available information, TPRC has instituted a *Data Update Plan* enabling the subscriber to inquire, by telephone if necessary, for specific information and receive, in many instances, same-day response on any new data processed or revision of published data since the latest edition. In this context, the TPRC Data Series departs drastically from the conventional handbook and giant multivolume classical works, which are no longer adequate media for the dissemination of numerical data of science and technology without a continuing activity on contemporary coverage. The loose-leaf arrangements of many works fully recognize this fact and attempt to develop a combination of bound volumes and loose-leaf supplement arrangements as the work becomes increasingly large. TPRC's *Data Update Plan* is indeed unique in this sense since it maintains the contents of the TPRC Data Series current and live on a day-to-day basis between editions. In this spirit, I strongly urge all purchasers of these volumes to complete in detail and return the *Volume Registration Certificate* which accompanies each volume in order to assure themselves of the continuous receipt of annual listing of corrigenda during the life of the edition.

The TPRC Data Series consists initially of 13 independent volumes. The initial ten volumes will be published in 1970, and the remaining three by 1972. It is also contemplated that subsequent to the first edition, each volume will be revised, updated, and reissued in a new edition approximately every fifth year. The organization of the TPRC Data Series makes each volume a self-contained entity available individually without the need to purchase the entire Series.

The coverage of the specific thermophysical properties represented by this Series constitutes the most comprehensive and authoritative collection of numerical data of its kind for science and technology.

Whenever possible, a uniform format has been used in all volumes, except when variations in presentation were necessitated by the nature of the property or the physical state concerned. In spite of the wealth of data reported in these volumes, it should be recognized that all volumes are not of the same degree of completeness. However, as additional data are processed at TPRC on a continuing basis, subsequent editions will become increasingly more complete and up to date. Each volume in the Series basically comprises three sections, consisting of a text, the body of numerical data with source references, and a material index.

The aim of the textual material is to provide a complementary or supporting role to the body of numerical data rather than to present a treatise on the subject of the property. The user will find a basic theoretical treatment, a comprehensive presentation of selected works which constitute reviews, or compendia of empirical relations useful in estimation of the property when there exists a paucity of data or when data are completely lacking. Established major experimental techniques are also briefly reviewed.

The body of data is the core of each volume and is presented in both graphical and tabular format for convenience of the user. Every single point of numerical data is fully referenced as to its original source and no secondary sources of information are used in data extraction. In general, it has not been possible to critically scrutinize all the original data presented in these volumes, except to eliminate perpetuation of gross errors. However, in a significant number of cases, such as for the properties of liquids and gases and the thermal conductivity of all the elements, the task of full evaluation, synthesis, and correlation has been completed. It is hoped that in subsequent editions of this continuing work, not only new information will be reported but the critical evaluation will be extended to increasingly broader classes of materials and properties.

The third and final major section of each volume is the material index. This is the key to the volume, enabling the user to exercise full freedom of access to its contents by any choice of substance name or detailed alloy and mixture composition, trade name, synonym, etc. Of particular interest here is the fact that in the case of those properties which are reported in separate companion volumes, the material index in each of the volumes also reports the contents of the other companion volumes.* The sets of companion volumes are as follows:

Thermal conductivity:	Volumes 1, 2, 3
Specific heat:	Volumes 4, 5, 6
Radiative properties:	Volumes 7, 8, 9
Thermal expansion:	Volumes 12, 13

The ultimate aims and functions of TPRC's Data Tables Division are to extract, evaluate, reconcile, correlate, and synthesize all available data for the thermophysical properties of materials with the result of obtaining internally consistent sets of property values, termed the "recommended reference values." In such work, gaps in the data often occur, for ranges of temperature, composition, etc. Whenever feasible, various techniques are used to fill in such missing information, ranging from empirical procedures to detailed theoretical calculations. Such studies are resulting in valuable new estimation methods being developed which have made it possible to estimate values for substances and/or physical conditions presently unmeasured or not amenable to laboratory investigation. Depending on the available information for a particular property and substance, the end product may vary from simple tabulations of isolated values to detailed tabulations with generating equations, plots showing the concordance of the different values, and, in some cases, over a range of parameters presently unexplored in the laboratory.

The TPRC Data Series constitutes a permanent and valuable contribution to science and technology. These constantly growing volumes are invaluable sources of data to engineers and scientists, sources in which a wealth of information heretofore unknown or not readily available has been made accessible. We look forward to continued improvement of both format and contents so that TPRC may serve the scientific and technological community with ever-increasing excellence in the years to come. In this connection, the staff of TPRC is most anxious to receive comments, suggestions, and criticisms from all users of these volumes. An increasing number of colleagues are making available at the earliest possible moment reprints of their papers and reports as well as pertinent information on the more obscure publications. I wish to renew my earnest request that this procedure become a universal practice since it will prove to be most helpful in making TPRC's continuing effort more complete and up to date.

It is indeed a pleasure to acknowledge with gratitude the multisource financial assistance received from over fifty of TPRC's sponsors which has made the continued generation of these tables possible. In particular, I wish to single out the sustained major support being received from the Air Force Materials Laboratory–Air Force Systems Command, the Office of Standard Reference Data–National Bureau of Standards, and the Office of Advanced Research and Technology–National Aeronautics and Space Administration. TPRC is indeed proud to have been designated as a National Information Analysis Center for the Department of Defense as well as a component of the National

---

*For the first edition of the Series, this arrangement was not feasible for Volume 7 due to the sequence and the schedule of its publication. This situation will be resolved in subsequent editions.

Standard Reference Data System under the cognizance of the National Bureau of Standards.

While the preparation and continued maintenance of this work is the responsibility of TPRC's Data Tables Division, it would not have been possible without the direct input of TPRC's Scientific Documentation Division and, to a lesser degree, the Theoretical and Experimental Research Divisions. The authors of the various volumes are the senior staff members in responsible charge of the work. It should be clearly understood, however, that many have contributed over the years and their contributions are specifically acknowledged in each volume. I wish to take this opportunity to personally thank those members of the staff, research assistants, graduate research assistants, and supporting graphics and technical typing personnel without whose diligent and painstaking efforts this work could not have materialized.

Y. S. TOULOUKIAN

Director
Thermophysical Properties Research Center
Distinguished Atkins Professor of Engineering

Purdue University
Lafayette, Indiana
July 1969

Introduction to Volume 4

This volume of *Thermophysical Properties of Matter*, the TPRC Data Series, was initiated in recent years and follows the general format of the Center's work on thermal conductivity.

The volume comprises three major sections: the front text material together with its bibliography, the main body of numerical data and its references, and the material index.

The text material is intended to assume a role complementary to the main body of numerical data, the presentation of which is the primary purpose of this volume. It is felt that a concise discussion of the theoretical nature of the property under consideration together with a review of predictive procedures and recognized experimental techniques will be appropriate in a major reference work of this kind. The extensive reference citations given in the text should lead the interested reader to a highly comprehensive literature for a detailed study. It is hoped, however, that enough detail is presented for this volume to be self-contained for the practical user.

The main body of the volume consists of the presentation of numerical data compiled over the years in a most comprehensive and meticulous manner. The scope of coverage includes the metallic elements and most metallic alloys of engineering importance. The extraction of all data directly from their original sources ensures freedom from errors of transcription. Furthermore, some gross errors appearing in the original source documents have been corrected. The organization and presentation of the data together with other pertinent information in the use of the tables and figures are discussed in detail in the text of the section entitled *Numerical Data*.

It is regrettable that the authors have not yet had the time to review and evaluate critically the extensive data compiled in this volume. However, it is hoped that the user will be able to exercise proper selectivity and discretion among conflicting sets of data based on the extensive information reported for each set in the accompanying specification tables.

As stated earlier, all data have been obtained from their original sources and each data set is so referenced. TPRC has in its files all documents cited in this volume. Those that cannot be readily obtained elsewhere are available from TPRC in microfiche form.

The material index at the end of the volume covers the contents of all three companion volumes (Volumes 4, 5, and 6) on specific heat. It is hoped that the user will find these comprehensive indices helpful.

This volume has grown out of activities made possible principally through the support of the Air Force Materials Laboratory–Air Force Systems Command, under the monitorship of Mr. John H. Charlesworth. In the preparation of Volume 4 we have drawn most heavily upon the scientific literature and hence we feel a debt of gratitude to the authors of the referenced articles.

While this volume is primarily intended as a reference work for the designer, researcher, experimentalist, and theoretician, the teacher at the graduate level may also use it as a teaching tool to point out to his students the topography of the state of knowledge on the specific heat of metals. We believe there is also much food for reflection by the specialist and the academician concerning the meaning of "original" investigation and its "information content."

The authors are keenly aware of the possibility of many weaknesses in a work of this scope. We hope that we will not be judged too harshly and that we will receive the benefit of suggestions regarding references omitted, additional material groups needing more detailed treatment, improvements in presentation, and, most important, any inadvertent errors. If the *Volume Registration Certificate* accompanying this volume is returned, the reader will assure himself of receiving annually a list of corrigenda as possible errors come to our attention.

Notation

A	Grüneisen constant; Cross-sectional area
a	Lattice constant: Empirical constant
b	Empirical constant
c, C	Heat capacity of mass m, specific heat per unit mass
C_a, C_f	Constant which depends on particular type of lattice and on crystal structure, respectively
C_e	Electronic specific heat
C_p, C_v	Specific heat at constant pressure and constant volume, respectively
d	Density
e	Base of natural logarithm, 2.71828
E	Total energy of an oscillator, particle, or system; Internal energy; Voltage
H	Enthalpy
$(\Delta H)_f$	Heat of fusion
h	Planck constant, 6.6262×10^{-27} erg sec
I	Electrical current
J, J'	Quantum mechanical exchange constants
K	Calibration factor in ice drop calorimeter
k	Boltzmann constant, 1.3806×10^{-16} erg K^{-1}
L	Linear dimension
m	Mass of a particle, system, or specimen
m_e	Mass of an electron
n	Integer, 0, 1, 2, 3, . . .
N_A	Avogadro's number, 6.0222×10^{23} g-mol^{-1}
N_e	Number of electrons per gram atom
p	Momentum of a particle; Pressure of a gas
q	Direction coordinate from equilibrium position
Q	Amount of heat absorbed or removed from the system
R	Gas constant, 8.3143 J K^{-1} g-mol^{-1}
s	Spin vector
T	Temperature, K
t	Time
V	Volume
v	Specific volume
W	Work done on or by the system
x, x_m	$h\nu/kT$ and $h\nu_D/kT$, respectively, as used in equation (17)
X_i	Atomic mole or mass fraction of ith component in an alloy or mixture
α, α_f	Coefficient of thermal linear expansion, and a constant which depends on crystal structure, respectively
β	Coefficient of isobaric volumetric expansion; Constant in Debye cube law
γ	Constant in the electronic specific heat relation (26)
θ_D, θ_E	Characteristic Debye temperature and Einstein temperature, $h\nu_D/k$ and $h\nu/k$, respectively
ν	Frequency of oscillation of a particle
ν_D	Debye frequency
ω	Natural angular frequency
ρ	Electrical resistivity
ρ_e	Number of free electrons per unit volume
ϵ	Energy of an oscillation
π	Mathematical constant, 3.14159 . . .
κ_T	Isothermal compressibility, as used in equation (36)

Theory of Specific Heat of Solids

1. INTRODUCTION

Rapid advances in the frontiers of science and technology have brought about a general realization of the fact that the present limitations in many technical developments are a direct result of inadequate knowledge of the thermophysical properties of materials. In the high-temperature range ($T > 1000$ K), interest in the determination of specific heats of materials has been hastened because of the requirements in space programs as well as industrial applications. The need for data at high temperatures has advanced our knowledge in many areas of solid state studies such as lattice vibrations, energy levels in magnetic solids, electronic distributions, and many other atomic and molecular phenomena.

The measurement of specific heat at cryogenic temperatures ($C_p \cong C_v$ for $T \leq 4$ K) provides us with a direct means to test theoretical models of a system. For instance, precise specific heat measurements were needed to test the validity of Debye's and Einstein's theory for specific heat of solids at low temperatures. Finally, knowledge of accurate specific heat data at low temperature is very useful in studies of cryogenic techniques.

2. DEFINITIONS

When a quantity of heat Q is added to a system so that there is a change in temperature, $T_2 - T_1$, then the mean heat capacity of the mass m of the substance is defined by

$$\bar{c} = \frac{Q}{T_2 - T_1} \tag{1}$$

The limiting value of the above ratio as the temperature changes by dT is defined as the true heat capacity, i.e.,

$$c = \frac{dQ^*}{dT} \tag{2}$$

In order to obtain a quantity that is independent of the mass, m, of a substance, equation (2) is divided by m; i.e.,

$$C = \frac{c}{m} = \frac{dQ}{m\,dT} \tag{3}$$

The quantity q represents the amount of heat per unit mass, so that equation (3) may also be written as

$$C = \frac{dq}{dT} \tag{4}$$

Raising the temperature of a unit mass of a substance by an amount dT, however, does not define the process in a thermodynamic sense; for instance, it will take a different amount of heat dq if the process is at constant pressure than when the process is at constant volume. As a matter of fact there are an infinite number of different processes for a system at temperature T to change to a temperature $T + dT$. It is clear, therefore, that an infinite number of specific heats could also be defined for a substance. The two processes that are most commonly used in thermodynamics are those at constant volume and constant pressure. For these two processes equation (4) may be written

$$C_p = \left(\frac{dq}{dT}\right)_p \tag{5}$$

and

$$C_v = \left(\frac{dq}{dT}\right)_v \tag{6}$$

Experimentally, the values of the specific heat measured are either at constant pressure, C_p, or at constant volume, C_v. The units most commonly used for specific heat are cal g^{-1} K^{-1}, Btu lb^{-1} F^{-1}, joules kg^{-1} K^{-1}. The units for molar or atomic specific heat are cal g-mol^{-1} K^{-1}, Btu lb-mol^{-1} F^{-1}, joules kg-mol^{-1} K^{-1}, cal g-atom^{-1} K^{-1}, joules kg-atom^{-1} K^{-1}, etc.

---

*dQ is used instead of dQ to indicate that it is not an exact differential.

3. DULONG AND PETIT'S LAW

In 1819 Dulong and Petit [9] published the results of their measurements on the specific heat at constant pressure of thirteen solid elements at room temperature. From these measurements, they observed that the product of the specific heat at constant pressure and the atomic weight was approximately a constant, about 6 cal g-atom^{-1} K^{-1}. Subsequent researches, extending from 1840 to 1862, revealed the general applicability of the Dulong and Petit's law to several metallic elements, when the specific heat at constant pressure was determined at temperatures sufficiently below their melting point but not far below room temperature. During the same period an important extension of Dulong and Petit's law was applied to chemical compounds, i.e., the molar specific heat of a compound is equal to the sum of the atomic specific heats of its constituent elements. This law which is generally referred to as the Kopp–Neumann law [32] has also been applied to predict the atomic specific heat of alloys. For alloys, the atomic specific heat is equal to the sum of the product of the atomic specific heat of each constituent element and its atomic fraction. If an alloy consists of elements 1, 2, 3, . . . , n, with atomic fraction $X_1, X_2, X_3, \ldots, X_n$ and atomic specific heat $C_{p1}, C_{p2}, C_{p3}, \ldots, C_{pn}$, then the atomic specific heat of the alloy is

$$C_p = \sum_{i=1}^{n} X_i C_{p_i} \tag{7}$$

Equation (7) should be applied with caution for alloys especially near magnetic and phase transitions. Bottema and Jaeger [5] have applied the Kopp–Neumann law to the alloy Ag_3Au and they found that the experimental data on the specific heat at constant pressure of this alloy agree closely with the calculated values between 0 C to 400 C. Between 400 C and 800 C, the values obtained from the Kopp–Neumann law were 0.5 percent to 1.8 percent higher than the experimental results. Buyco [46] calculated the specific heat of the alloys of aluminum, beryllium, nickel, and iron between 300 K to 1000 K and found the calculated values agree with the experimental data to within 5 percent.

The theoretical justification of the law of Dulong and Petit was demonstrated by Boltzmann in 1871. The results obtained previously by Dulong and Petit also follow from Boltzmann's equipartition of energy theorem. Complete and detailed derivation of this theorem is discussed elsewhere [15, 20, 21, 33, and 43].

The following is a brief exposition. The energy of a linear harmonic oscillator consists of kinetic and potential energies, i.e.,

$$E = \frac{p^2}{2m} + \frac{m\omega^2 q^2}{2} \tag{8}$$

where p is the momentum, m is the mass, ω is the natural angular frequency, q is the distance from equilibrium position, and E is the total energy of an oscillator. From the theorem of equipartition of energy [15, 20, 21, 31], each degree of freedom contributes $(kT/2)$ to the energy of a particle in equilibrium. A three-dimensional oscillator which has six degrees of freedom will therefore have an internal energy of $3\,kT$ at thermal equilibrium. A gram-atom of an element has N_A atoms; hence, the internal energy is $3N_AkT$. The specific heat at constant volume is obtained by differentiating the internal energy with respect to temperature at constant volume, i.e.,

$$\left(\frac{\partial E}{\partial T}\right)_v = C_v = 3N_Ak \tag{9}$$

where N_A is the Avogadro constant and k is the Boltzmann constant. The product of Avogadro constant and Boltzmann constant is equal to the gas constant R. Therefore:

$$C_v = 3R \cong 5.96 \text{ cal mol}^{-1}\text{ K}^{-1}$$

Hence, the Dulong and Petit value of about 6 cal mol^{-1} deg^{-1} for the specific heat of metallic solids can be accounted for on the basis of classical statistical mechanics. However, the observation of Dulong and Petit was short lived. In 1875 Weber [48] showed that the atomic specific heat of silicon, boron, and carbon are considerably lower than the values predicted by Dulong and Petit. For example, the atomic specific heat of crystalline silicon, boron, and diamond were found to be 4.8, 2.7, and 1.8 cal mol^{-1} deg^{-1}, respectively, at room temperature. Subsequent specific heat measurements at low temperatures ($T < 300$ K) revealed that the specific heat of solids increased rapidly with temperature and almost leveled off about their Debye temperature. Classical theory does not explain this behavior for solids. It should also be noted that classical theory encounters the same difficulty in the behavior of molar specific heats.

4. EINSTEIN'S SPECIFIC HEAT THEORY

Einstein [10] proposed a simple model to account for the decrease in the specific heat at low temperatures below the value $3R$ per mole which was obtained at elevated temperatures. His oversimplified physical model considers the thermal properties of the vibrations of a lattice of N_A atoms as a set of $3N_A$ independent harmonic oscillators in one dimension, each with the same frequency, ν. He then quantized the energy of the oscillators in accordance with the results obtained by Planck. According to Planck, a harmonic oscillator does not have a continuous energy spectrum but can accept energy values equal to an integer times $h\nu$, where ν is the frequency of oscillations and h is the Planck constant. Hence the possible energy levels of an oscillator may be given by

$$\epsilon = nh\nu \qquad n = 0, 1, 2, 3, \ldots$$

The average energy of an oscillator at temperature T, according to the well known Planck formula [7, 20, 21, 32], is

$$\bar{\epsilon} = \frac{h\nu}{\exp(h\nu/kT) - 1} \tag{10}$$

In Einstein's model the vibrational energy of a solid element containing N_A atoms is $3N_A$ times the average energy of an oscillator, i.e.,

$$\bar{E} = 3N_A \frac{h\nu}{\exp(h\nu/kT) - 1} \tag{11}$$

The results obtained from quantum mechanics however showed that the average energy of an oscillator [7, 15] should be written as

$$\bar{\epsilon} = \frac{h\nu}{2} + \frac{h\nu}{\exp(h\nu/kT) - 1} \tag{12}$$

instead of as in equation (10).

The result obtained for the specific heat by differentiating equation (10) is the same as that obtained from equation (12). In any case the specific heat for one atom of an element is

$$\left(\frac{\partial E}{\partial T}\right)_v = C_v = \frac{3N_A k(h\nu/kT)^2 \exp(h\nu/kT)}{[\exp(h\nu/kT) - 1]^2} \tag{13}$$

For convenience, the characteristic Einstein temperature defined by $\theta_E = h\nu/k$ may be introduced in equation (13) to obtain

$$C_v = \frac{3R(\theta_E/T)^2 \exp(\theta_E/T)}{[\exp(\theta_E/T) - 1]^2} \tag{14}$$

In the high-temperature range with $T \gg \theta_E$ [15, 20, 21, 32], equation (14) upon expansion in power series becomes

$$C_v \cong 3R\left[1 - \frac{1}{12}\left(\frac{\theta_E}{T}\right)^2\right] \tag{15}$$

When the value of $[(\theta_E/T)^2/12]$ is such that it is very much smaller than 1, then Einstein's theory yields the classical Dulong and Petit value of 6 cal mol^{-1} deg^{-1}.

In the low-temperature region $T \ll \theta_E$, equation (14) may be written approximately as

$$C_v \cong 3R\left(\frac{\theta_E}{T}\right)^2 \exp(-\theta_E/T) \tag{16}$$

According to equation (16), the low-temperature specific heat of solids should approach zero exponentially. Experimental evidence indicates that C_v approaches zero more slowly than this. The reason for the discrepancy between Einstein's theoretical prediction and the experimental results may be explained on the basis of the assumption made in the theory that each atom in a solid vibrates independently of the others but with precisely the same frequency. However, in spite of the weakness in Einstein's theory, his pioneering work opened the way for the application of quantum theory to the specific heat of solids.

5. DEBYE'S SPECIFIC HEAT THEORY

From the point of view of the wave whose wavelength is large compared with the interatomic distances, a crystal may appear like a continuum. The fundamental assumption of Debye [6] is that the continuum model may be employed for all possible vibrational modes of the crystal. Debye has given a limit to the total number of vibrational modes equal to $3N_A$, where N_A is the number of atoms in a gram atom of an element. In this case, the frequency spectrum which corresponds to an ideal continuum is cut off in order to comply with a total of $3N_A$ modes. This procedure should provide a maximum frequency ν_D (Debye frequency) which is common to both the longitudinal and transverse modes. By associating with each vibrational mode a harmonic oscillator of the same frequency, Debye obtained the following expression [7, 15, 20, 21, 32] for the vibrational energy:

$$\bar{E} = 9N_A h\nu_D \left(\frac{kT}{h\nu_D}\right)^4 \int_0^{x_m} \frac{x^3\,dx}{e^x - 1} \tag{17}$$

where

$$x = h\nu/kT \qquad x_m = h\nu_D/kT$$

Clearly, when $T \gg \theta_D$, x_m is small compared with unity for the whole integration range. In this case $e^x - 1 \cong x$ so that equation (17) could easily be integrated to obtain the expression

$$\bar{E} \cong 3N_A kT \tag{18}$$

Then

$$\left(\frac{\partial \bar{E}}{\partial T}\right)_v = C_v = 3N_A k = 3R \cong 6 \text{ cal mol}^{-1} \text{ deg}^{-1}$$

a result agreeing with classical theory.

At very low temperatures, $T \ll \theta_D$, the upper limit of integration in equation (17) may be replaced by infinity since $h\nu/kT \to \infty$ as $T \to 0$. It is now possible to integrate equation (17) as follows [51]

$$\int_0^\infty \frac{x^3\, dx}{e^x - 1} = 6 \sum_1^\infty \frac{1}{n^4} = \frac{\pi^4}{15} \tag{19}$$

Hence

$$\bar{E} = \frac{3}{5}\pi^4 N_A kT \left(\frac{T}{\theta_D}\right)^3 \tag{20}$$

and

$$C_v = \left(\frac{\partial \bar{E}}{\partial T}\right)_v = \frac{12}{5}\pi^4 N_A k \left(\frac{T}{\theta_D}\right)^3 \tag{21}$$

or

$$C_v = \frac{12}{5}\pi^4 R \left(\frac{T}{\theta_D}\right)^3 \tag{22}$$

For one atom or one mole of a substance, $R = 1.987$ cal mol^{-1} deg^{-1} so that equation (22) may be written as

$$C_v = 464.5\left(\frac{T}{\theta_D}\right)^3 \text{ cal mol}^{-1} \text{ deg}^{-1} \qquad T < \left(\frac{\theta_D}{50}\right) \tag{23}$$

Debye's theory predicts a cube law dependence of the specific heat of the elements for temperatures $T < (\theta_D/10)$. The range of validity of this law [15] has now been restricted to $T < (\theta_D/50)$ as a result of more recent theoretical work on specific heat studies. The predictions of Debye's theory agree quite well with experimental values of the specific heat of solids and is a definite improvement over Einstein's work.

Due to improved calorimetric measurements at low temperatures ($T < 5$ K), in recent years accurate specific heat values revealed that Debye's equation for C_v does not fit the experimental results precisely. Furthermore, it was observed that θ_D, which according to Debye's theory is a constant, did in fact vary with temperature. The deficiency of the Debye theory may be explained on the basis of the approximation made in treating solids as a continuous elastic media and neglecting the discreteness of the atoms.

Further improvements on Debye's theory was developed by Born and Karman [4]. They calculated the frequency spectrum by considering the lattice modes of vibration for a particular crystal structure under investigation. The method is involved so that one is referred to the original work [4] for detailed discussion.

6. ELECTRONIC SPECIFIC HEAT

In 1900, Drude [8] suggested a model for a free-electron theory of metals. He assumed that metals contain free electrons in thermal equilibrium with the atoms of the solid. He further assumed that the potential energy of the free electrons is equal to the product of the number of electrons per unit volume and the average energy of an electron. The essential feature in the problem is the determination of the number of electrons with energy between E and $E + dE$. Classical theory using Maxwell–Boltzmann statistics [2, 8, 15, 20, 21, 32, 43], would give an expression for the electronic specific heat as

$$C_e = \tfrac{3}{2} N_e k \tag{24}$$

Using Fermi–Dirac statistics [7, 15, 19, 20, 21, 31, 32], the following expression for the electronic specific heat may be obtained at low temperatures:

$$C_e = \pi^2 R(2m_e k/h^2)\left(\frac{\pi}{3\rho_e}\right)^{2/3} T \tag{25}$$

or simply

$$C_e = \gamma T \tag{26}$$

where ρ_e is the number of free electrons per unit volume, γ is the proportionality constant, T is the absolute temperature, N_e is the number of electrons per gram atom, m_e is the mass of an electron, k is the Boltzmann constant, h is the Planck constant, R is the gas constant, and C_e is the electronic specific heat.

The specific heat of metals below the Debye temperature and "very much" below the Fermi temperature [15, 19, 20, 21, 32] may be expressed as the sum of the electronic specific heat and the lattice specific heat, i.e.,

$$C_v = \gamma T + \beta T^3 \tag{27}$$

Indeed, this relationship has been verified by accurate low temperature specific heat measurements. At sufficiently low temperature ($T < 1$ K) the electronic specific heat is dominant, while at high temperatures the lattice contribution is predominant.

7. MAGNETIC SPECIFIC HEAT

There are two types of materials that exhibit a magnetic contribution to the total specific heat: namely, the ferromagnetic and the ferrimagnetic materials.

A ferromagnet is a material [7, 15, 20, 21, 32] that contains a spontaneous magnetic moment. This means that this material possesses a magnetic moment even in the absence of an external magnetic field. This type of material exhibits a magnetic ordering with parallel alignment of adjacent spins. A ferromagnetic material has a Curie temperature, T_c, which is defined as the temperature above which magnetization disappears, and the material becomes paramagnetic. The Curie temperature separates the ordered ferromagnetic phase from the disordered paramagnetic phase.

An antiferromagnet is a material [7, 15, 20, 21, 32], that has spins which are ordered in an antiparallel arrangement. There is no net magnetic moment at temperatures below the Néel temperature. Hysteresis is usually observed and a sharp maximum in the susceptibility curve is exhibited. Above the Néel temperature, the spins are said to be free, and the material becomes paramagnetic. In some ways ferrimagnetic materials are similar to the ferromagnetic materials except that in the former the adjacent spins are unequal and antiparallel. The Néel temperature may be defined for ferrimagnetic material as the temperature separating the ordered ferrimagnetic phase from the disordered paramagnetic phase.

For ferri- and ferromagnets, the internal energy [7, 15, 20, 21, 32], is given by the expression

$$\bar{E} = 4\pi V(2\alpha_f Jsa^2)\left(\frac{kT}{2\alpha_f Jsa^2}\right)^{5/2} \int_0^x \frac{x^4\,dx}{e^{x^2} - 1} \tag{28}$$

At low temperatures the upper limit for x may be taken equal to infinity and hence the integral may be easily determined. Differentiating equation (28) gives the magnetic specific heat [15]

$$C_M = \frac{d\bar{E}}{dT} = C_f N_A k\left(\frac{kT}{2Js}\right)^{3/2} \tag{29}$$

where α_f and C_f are constants which depend upon crystal structure, a is the lattice constant, J is the quantum mechanical exchange constant, k is the Boltzmann constant, N_A is the Avogadro number, s is the magnitude of the spin vector, and V is the volume of the material.

Equation (29) shows that at low temperatures the ferromagnetic contribution to the specific heat is proportional to the three-halves power of the absolute temperature. For metals which are ferromagnetic [15], the total specific heat is equal to the sum of the electronic, lattice, and magnetic terms, i.e.,

$$C_v = \gamma T + \beta T^3 + \delta T^{3/2} \tag{30}$$

For ferrimagnets, which are electrical insulators, [15], the electronic term is negligible compared with the other terms, so that the total specific heat may be given by the expression

$$C_v = \beta T^3 + \delta T^{3/2} \tag{31}$$

Both sides of equation (31) may be divided by $T^{3/2}$ to give

$$C_v/T^{3/2} = \beta T^{3/2} + \delta \tag{32}$$

A plot of $C_v/T^{3/2}$ versus $T^{3/2}$ should give a straight line with slope β and intercept δ.

For the case of antiferromagnetic materials [15], the expressions for the mean internal energy is

$$\bar{E} = 4\pi V(2\alpha_a J' sa^2)\left(\frac{kT}{2\alpha_a J' sa^2}\right)^4 \int_0^x \frac{x^3\,dx}{e^x - 1} \tag{33}$$

The upper limit for integration may be taken as equal to infinity at low temperatures so that differentiation of equation (33) gives the magnetic specific heat [15, 28]

$$C_M = C_a N_A k\left(\frac{kT}{2J's}\right)^3 \tag{34}$$

where C_a is a constant which depends upon the type of lattice and J' is the magnitude of the exchange constant.

The striking difference between the contributions to the specific heat exhibited by ferromagnets and ferrimagnets is the $T^{3/2}$ dependence in the former and T^3 dependence in the latter. Hence for antiferromagnetic materials, the temperature dependence is of the same form as the Debye's T^3 formula. The separation of the spin wave contribution from the lattice specific heat in antiferromagnetic materials is indeed very difficult.

8. LOW-TEMPERATURE SPECIFIC HEAT

The specific heat of solids is ordinarily measured at constant pressure. The specific heat at constant volume is that which is obtained if the interatomic distance is kept constant as the temperature changes. The specific heat at constant volume, C_v, may be assumed to be approximately equal to the specific heat at constant pressure, C_p, at cryogenic temperatures. At high temperatures, $C_p > C_v$. This difference is obtained from the classical thermodynamic relations

$$C_p - C_v = -T\left(\frac{\partial V}{\partial T}\right)_p^2 \Big/ \left(\frac{\partial V}{\partial p}\right)_T \qquad (35)$$

From the definition of the isothermal compressibility

$$\kappa_T = -\left(\frac{\partial V}{\partial p}\right)_T \Big/ V \qquad (36)$$

and the isobaric coefficient of volumetric expansion

$$\beta = \left(\frac{\partial V}{\partial T}\right)_p \Big/ V \qquad (37)$$

Using equations (36) and (37), equation (35) may be written as

$$C_p - C_v = \frac{TV\beta^2}{\kappa_T} \qquad (38)$$

By rearranging equation (38), this may also be written as

$$C_p - C_v = \left(\frac{V\beta^2}{\kappa_T C_p^2}\right) C_p^2 T = AC_p^2 T \qquad (39)$$

where

$$A = \frac{V\beta^2}{\kappa_T C_p^2}$$

The parameter A is called the Grüneisen constant, which is actually only approximately constant [15] over a wide range of temperature. If A is calculated at any one temperature from values of V, β, and κ_T, it may be used [15, 20, 21, 32] to calculate $C_p - C_v$ over a wide range of temperature without introducting a serious error.

For isotropic substances, the isothermal coefficient of volumetric expansion may be written in terms of the coefficient of linear expansion

$$\beta = \left(\frac{\partial V}{\partial T}\right)_p \Big/ V = 3\left[\left(\frac{\partial L}{\partial T}\right)_p \Big/ L\right] = 3\alpha \qquad (40)$$

Hence, from equation (38)

$$C_p - C_v = \frac{9\alpha^2}{\kappa_T} TV = \left(\frac{9V\alpha^2}{\kappa_T C_p^2}\right) C_p^2 T \qquad (41)$$

where

$$A = \frac{9V\alpha^2}{\kappa_T C_p^2}$$

In the absence of contributions from magnetic and nuclear specific heat, the expression for C_v for most metals has been shown [15, 20, 21, 32] to be

$$C_v = \gamma T + \beta T^3 \qquad (27)$$

where γT is the electronic contribution and βT^3 is the lattice contribution. For nonmetals, the electronic contribution may be very small compared with the lattice term so that

$$C_v = \beta T^3 \qquad (42)$$

When the nuclear quadrupole moment interacts with the electronic field gradient of the lattice and the electron, then the total specific heat of the substance is given as

$$C_v = \gamma T + \beta T^3 + \alpha T^{-2} \qquad (43)$$

where αT^{-2} is the nuclear contribution to the total specific heat.

9. NORMAL AND SUPERCONDUCTING MATERIALS

At a certain critical temperature (superconducting temperature), several materials exhibit superconducting behavior [15, 20, 21, 32]. Below this temperature, the specific heat of a superconducting material is found to depart significantly from the values obtained for a normally behaving material. It is also found that if an external magnetic field of sufficient strength is applied while the specific heat of the material is being measured, the values obtained correspond to what the normal values would be. Hence, the specific heat values obtained experimentally in the presence of sufficient external magnetic field below the superconducting critical temperature are referred to as the normal specific heat (C_N) while the values obtained in the absence of a magnetic field are referred to as superconducting specific heat (C_S). For example, the critical superconducting temperatures of aluminum and niobium are approximately 1.196 K and 9.22 K, respectively.

Other Major Sources of Data

There exists in the literature a number of reference sources which, while less extensive in scope, may nevertheless prove valuable to the reader. While it is not the intent here to cite every available review, it is felt that the following works, listed in chronological order, are of particular significance. One should note that most of the citations do not present critical evaluation of the data they report.

Furukawa, Saba, and Reilly [12] report on the critical analysis of the thermodynamic properties of copper, silver, and gold between 0 and 300 K. A tabulation is given for the values of specific heat C_p, enthalpy $H - H_0^0$, entropy S^0, Gibbs energy $G - H_0^0$, enthalpy function $(H - H_0^0)/T$ and Gibbs energy function $(G - H_0^0)/T$. The report also contains a comparison of the values of the electronic coefficient of the specific heat and the 0 K limiting Debye characteristic temperature with their selected values. An appraisal of low-temperature calorimetry is also given.

Touloukian [44] edited a handbook entitled *Thermophysical Properties of High Temperature Solid Materials* consisting of nine books totaling more than 8500 pages. The properties covered in the handbook are density, melting point, heat of fusion, heat of vaporization, heat of sublimation, electrical resistivity, specific heat at constant pressure, thermal conductivity, thermal diffusivity, thermal linear expansion, thermal radiative properties (absorptance, emittance, reflectance, and transmittance), and vapor pressure. Generally, only materials with melting points above 800 K are included, except for materials within the categories of polymers, plastics, and composites.

Touloukian, Gerritsen, and Moore [45], *Thermophysical Properties Research Literature Retrieval Guide*, consisting of a set of three books, contains references for 33,700 research documents on thermophysical properties of matter. The properties covered are thermal conductivity, specific heat at constant pressure, viscosity, thermal radiative properties (emissivity, absorptivity, reflectivity, transmissivity), optical constants (total and spectral), diffusion coefficient, thermal diffusivity, and Prandtl number. This publication supersedes the earlier works of this series (Volume I, 1960 and Volume II, 1963), and constitutes an enlarged and consolidated definitive work reporting the total literature through June 1964.

Schick [29] edited a comprehensive work entitled *Thermodynamics of Certain Refractory Compounds*. Volume 2 of this work includes thermodynamic properties of borides, carbides, nitrides, and oxides of 31 elements in the temperature range from 0 to 6000 K. Over 160 thermodynamic tables, together with comprehensive discussions, are presented.

Moeller et al.'s [24] compilation on *Thermophysical Properties of Thermal Insulating Materials* should prove useful in cryogenic and high temperature applications. The properties included in this compilation are thermal conductivity, thermal linear expansion, specific heat, total normal emittance, thermal diffusivity, compressive strength, density, melting point, and modulus of elasticity. Various experimental methods for determining thermal properties are described and their accuracies are indicated.

Wood and Deem [52] report on the compilation of specific heat, thermal linear expansion, and thermal conductivity data for materials of possible structural usefulness above 1500 K. Data are presented graphically with notations as to measurement methods and test conditions.

Hultgren, Orr, Anderson, and Kelley [16] published their book on the *Selected Values of Thermodynamic Properties of Metals and Alloys* in 1963. This book presents in tabular form heat capacity, enthalpy, entropy, free energy function, and vapor pressure. In some cases the heat of fusion, melting point, and other transition temperatures are also given. For the binary alloys, phase diagrams are included.

Eldridge and Deem [11] issued a report under the auspices of the Data and Publication Panel of

ASTM–ASME joint committee on effects of temperature on the properties of metals. The metals covered are Al, Co, Fe, Mg, Mo, Ni, and their alloys. The properties included are thermal conductivity, thermal linear expansion, specific heat, electrical resistivity, density, emissivity, diffusivity, and magnetic permeability. Emphasis is given to data over a range from cryogenic (2 K) to elevated temperatures (2800 K).

Johnson [17] edited a compendium of the properties of materials at low temperatures. The first phase of the compendium covers properties of ten fluids (Part I), properties of solids (Part II), and an extensive bibliography of references (Part III). The properties covered are density, expansivity, thermal conductivity, specific heat, enthalpy, heats of transition, phase equilibria, dielectric constants, adsorption, surface tension, and viscosity for solid, liquid, and gas phases of He, H_2, Ne, N_2, O_2, air, CO, F_2, A, and NH_3. Data sheets, primarily in graphic form, are presented for "best values" of data collected. The sources of the materials used, other references, and tables of selected values with appropriate comments are furnished with each data sheet.

Kelley's [18] bulletin contains the then-available high-temperature specific heat data for the elements and inorganic compounds. The thermodynamic properties are listed in tables and algebraic expressions for their representations are also given.

Stull and Sinke [40] published their well-known reference work on the *Thermodynamic Properties of the Elements* in 1956. This book reports specific heat as well as thermodynamic property values for the elements in their condensed and gaseous state. A search of the literature was made by the authors through 1955. Whenever experimental data were not available, reasonable estimates were made in order to fill the gaps in information. A tabulation of thermodynamic values from 298.15 K to 3000 K is given for the elements.

Methods for the Measurement of the Specific Heat of Solids

1. INTRODUCTION

There are few methods for the practical and precise determination of the specific heat of solids. Although many variants and minor modifications or improvements are reported in the various references cited in this section, the most important ones are described in detail in reference [54]. References [55] to [61] also constitute major works on calorimetry including various specialized applications.

The primary methods for the measurement of the specific heat of solids which are commonly used are the method of mixtures or drop method, adiabatic method, comparative method, pulse-heating method, and modifications of these. A number of specific calorimetric techniques are briefly described in this section.

The method of mixtures [14, 37, 50] is widely employed for measuring specific heats of solids above room temperature. This method frequently gives accurate results in a temperature range where no phase transition exists. The usual method consists of dropping the substance under investigation from a furnace temperature into a calorimeter (at room or ice temperature) and the quantity that is obtained directly is the change in enthalpy. Heat capacities are obtained from these values by differentiation, i.e., $C_p = (\partial H/\partial T)_p$. This method is inherently not suitable for use with substances which undergo phase transitions over the temperature range of interest or whose specific heat is highly temperature sensitive.

Various methods of obtaining directly the true specific heat based on the Nernst calorimeter [38, 42, 47, 49] have been used successfully in obtaining precise data in the temperature range below room temperature. Attempts to use this method at moderately high temperatures have not produced accurate results because of heat exchange with the surroundings. This method involves the measurement of energy required to raise the temperature of the substance over small temperature intervals from a fraction of a degree to a few degrees.

2. NERNST-TYPE ADIABATIC VACUUM CALORIMETER

A typical adiabatic vacuum calorimeter consists of a block over which an insulated coil of platinum wire is wound. The block may be either a solid sample under investigation or a container for the solid sample. The block is suspended by leads in a vacuum-tight container. The container is cooled in a dewar containing liquid air, hydrogen, or helium, depending on the temperature range involved. At the start of the operation, the vacuum-tight container is filled with helium gas at very low pressure while the block is cooled to the bath temperature by heat transfer through the helium gas. After the block has been cooled, the gas is removed by pumping and a known amount of heat is applied to the platinum coil by means of electric current for a given time interval. The temperature rise of the block is measured by means of a suitable resistance thermometer. The specific heat is then determined from the measured heat input and temperature change of the sample. Improved versions of the Nernst-type adiabatic calorimeter are described by Taylor and Smith [42], Wallace *et al.* [47], and Westrum [49].

The calorimeter assembly which is discussed by Wallace *et al.* [47] consisted of the sample container, the thermal shields, the outer jacket with associated radiation shields, and the vacuum system. Figure 1 presents a schematic diagram of the calorimeter.

3. MODIFIED ADIABATIC CALORIMETER

A modification of the direct method has been applied successfully by Schmidt and Leidenfrost [30] to obtain the specific heats of powders and granular materials from 273 K to 773 K. The determination of specific heats was carried out for Mond Nickel (99.85% Ni) with an accuracy of 0.6 percent.

The theory of the method as employed for a continuously heated adiabatic calorimeter for measuring powders and granular materials is discussed in detail in reference [30].

Consider a calorimeter and sample system with negligible heat loss to the surroundings, then the heat input may be expressed as

$$\frac{dQ}{dt} = mC_p\frac{dT}{dt} + W_c\frac{dT}{dt} \tag{44}$$

where dQ/dt is the heat input per unit time, T is the temperature, t is the time, m is the mass of the specimen, W_c is the thermal constant of calorimeter body and heater element, energy per degree, and C_p is the specific heat of specimen. From equation (44),

$$C_p = \frac{1}{m}\left[\frac{dQ/dt}{dT/dt} - W_c\right] \tag{45}$$

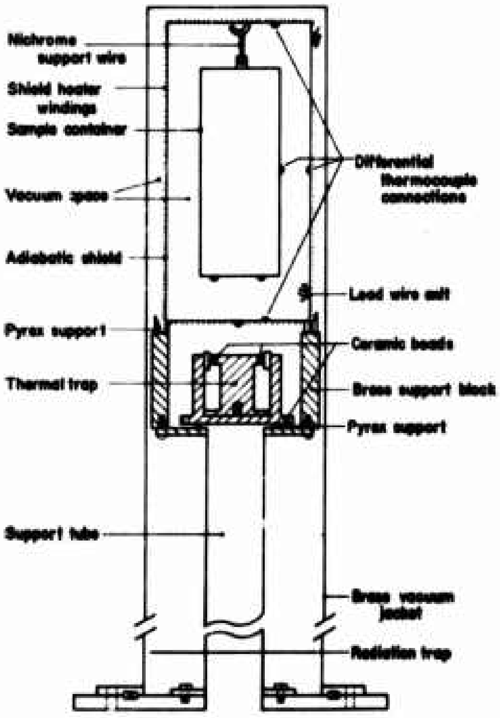

Fig. 1. Schematic diagram for adiabatic specific heat calorimeter [47].

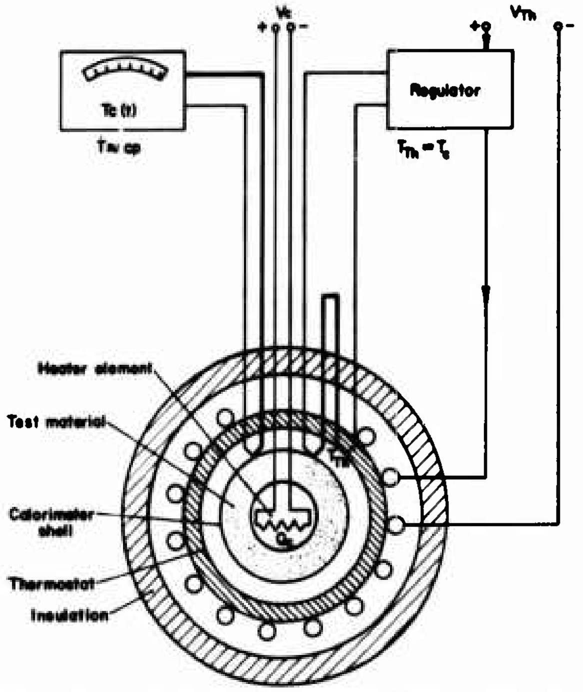

Fig. 2. Schematic diagram for spherical adiabatic calorimeter [30].

It is desirable to achieve as small a temperature variation as possible if the specific heat is assumed constant during each measurement interval. On the other hand, this temperature variation must be large enough to lend itself to precision measurement. The heating must be such that steady-state condition is reached within a reasonable length of time. Schmidt and Leidenfrost [30] have shown that for powders or granular materials of low thermal diffusivity, the following assumptions can be satisfied well enough to yield accurate measurements:

1. The temperature field is dependent only on time and the radial coordinate.
2. The sample is uniformly homogeneous, and its properties are constant over small temperature differences.
3. The sum of the heat capacities of the calorimeter body and its inside heater is small compared with the heat capacity of the sample mass.

The experimental arrangement of the apparatus is shown in schematic form in Fig. 2.

4. DROP ICE CALORIMETER

In this method [13] the heat given off by the sample is used to melt a portion of the ice in an equilibrium ice-water bath and the resulting change

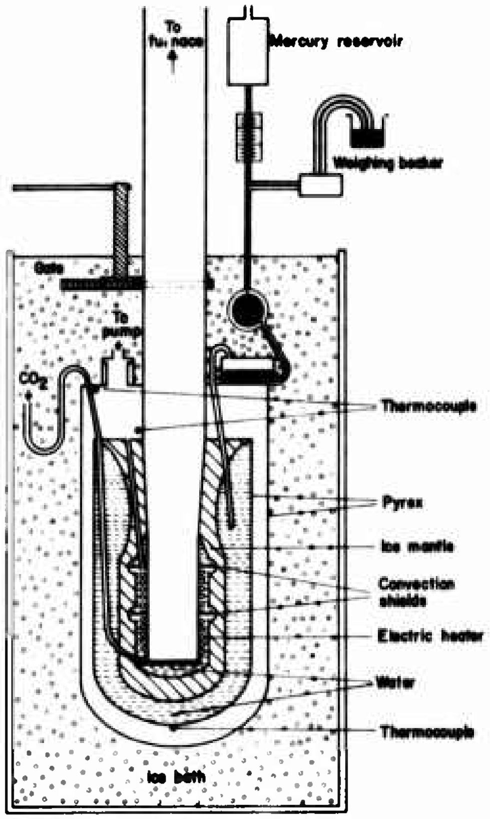

Fig. 3. Schematic diagram for drop ice calorimeter [13].

in volume of the bath is measured by the change in height of a mercury column. The calibration factor for a particular calorimeter (ratio of heat input to mass of mercury displaced by melted ice) is determined from the following expression:

$$K = \Delta H_f/(v_i - v_w)d_m \qquad (46)$$

where K is the calibration factor, ΔH_f is the heat of fusion of ice, v_i is the specific volume of ice, v_w is the specific volume of water, and d_m is the density of mercury.

The calibration factor K relates the enthalpy change of the specimen to the height of the mercury column. Values of $(H_T - H_{273.15})$ are then determined for various initial specimen temperatures. These data are either represented graphically or by a suitable empirical relation. The specific heat curve is either derived from the graphically smoothed enthalpy data or from the equation

$$C_p = \frac{d}{dT}(H_T - H_{273.15})_p$$

A schematic drawing of the ice calorimeter is shown in Fig. 3. A central well is provided to receive the specimen whose enthalpy is to be determined. An electric heater, sheathed in a metal tube, is soldered on the outside of the well in order to introduce known amounts of heat for calibration purposes. The lower portion of the well is surrounded by two coaxial glass vessels which provide an insulating space between the inner ice-water system and the surrounding ice bath. Any volume change resulting from the melting of ice in the inner vessel displaces an equivalent volume of mercury and is collected in a beaker and weighed to account for the change in mercury in the calorimeter. A special gate prevents heat transfer from above to the calorimeter along the central well.

5. DROP ISOTHERMAL WATER CALORIMETER

In the drop water calorimeter a sample is heated in the furnace and dropped into the calorimeter

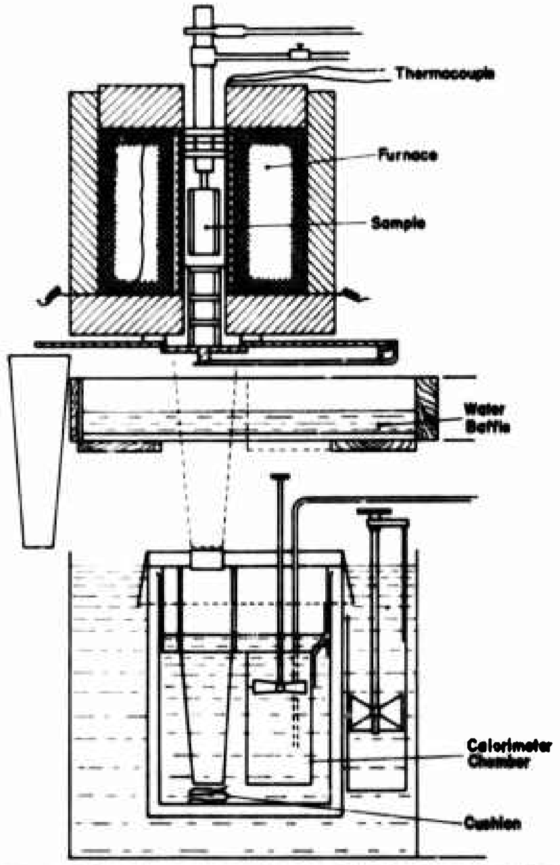

Fig. 4. Schematic diagram for drop isothermal water calorimeter [50].

proper, which consists of a water bath with free air space above. The water in the bath is stirred to assure uniform temperature. The calorimeter is enclosed by an isothermal jacket and the top is covered with copper plates which have a constant temperature because of their high thermal conductivity. The rise in the temperature of the calorimeter is measured with great accuracy by using a Beckmann thermometer or a sensitive thermopile. The enthalpy change of the specimen is determined from the known heat capacity of the calorimeter and its temperature rise. The enthalpy change may be referred to either 273.15 K or 298.15 K. In either case the specific heat is obtained from the smoothed enthalpy data by either graphical or analytical differentiation, i.e.,

$$C_p = \frac{d(H_T - H_{298.15})_p}{dT}$$

A schematic drawing [50] is shown in Fig. 4 to illustrate the details of the apparatus.

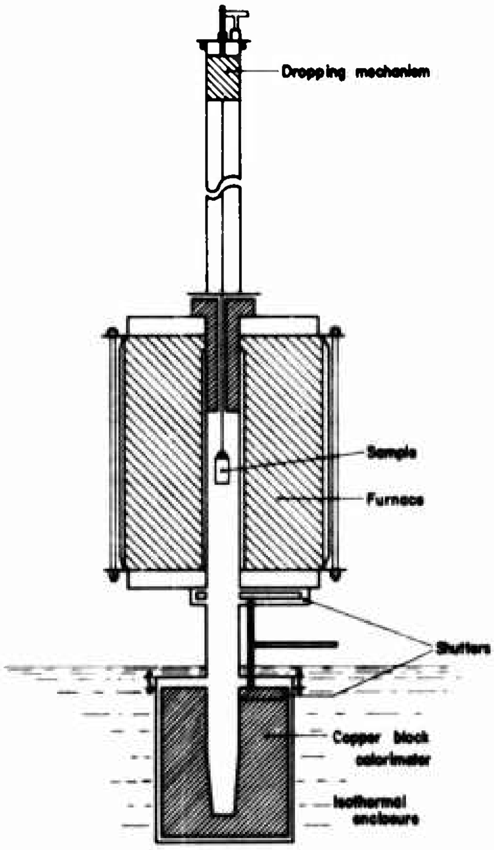

Fig. 5 Schematic diagram for drop isothermal copper block calorimeter [37].

6. DROP COPPER BLOCK CALORIMETER

This drop calorimeter employs a copper block which is submerged in an isothermal oil bath. The temperature of the calorimeter is measured using a special bridge network of copper and manganin resistances. The heat released from the sample is distributed to the copper block because of its high thermal conductivity. Generally it takes some time to achieve uniform heat distribution. The change in enthalpy of the specimen is measured in terms of the amount of heat absorbed by the copper block in changing from its initial temperature to its final temperature. This value is then corrected to 298.15 K so that the tabulated enthalpy values of the specimen are referred to 298.15 K, that is, $H_T - H_{298.15}$. The specific heat as a function of temperature may then be derived from the smoothed enthalpy data obtained either graphically or from the equation

$$C_p = \frac{d}{dT}(H_T - H_{298.15})_p$$

A schematic diagram according to Southard [37] is shown in Fig. 5.

7. PULSE-HEATING METHOD

The pulse-heating method of measuring specific heat is very attractive, particularly for materials that are electrical conductors. This method was first discussed by Avramescu [1] and later modified by other investigators [2, 25, 39, 41]. The method involves the rapid heating of small samples in vacuum. Voltage probes are attached across the central portion of the sample wire which is then mounted in a high-vacuum system. The sample is connected to an electrical circuit consisting of a large storage battery, a variable resistor, a fixed resistor, and a high-current relay controlled by a timing circuit which determines the duration of the pulse. A schematic diagram of a typical circuit [41] for the measurement of specific heat is shown in Fig. 6. The current flowing through the specimen and the voltage drop across the central portion are measured simultaneously as a function of time. The specific resistance at each time interval is calculated from the relationship $\rho = AE/LI$, where A is the cross-sectional area of sample, E is the voltage, I is the current, and L is the distance between voltage probes. This specific electrical resistance is then plotted as a function of time. The specific heat at any temperature T is given by the equation

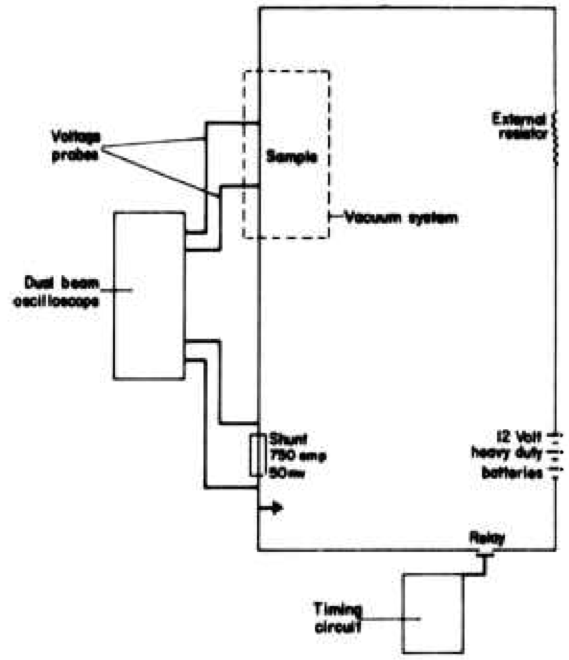

Fig. 6. Schematic diagram of circuit for specific heat measurement using pulse-heating method [41].

$$C_p = \frac{EI(d\rho/dT)}{Jm(d\rho/dt)} \tag{47}$$

where C_p is the specific heat, cal g^{-1} K^{-1}, J is the conversion factor, 4.184 joules cal^{-1}, m is the mass of sample between voltage probes, grams, $d\rho/dT$ is the temperature coefficient of the resistance at temperature T, $d\rho/dt$ is the time rate of change of resistivity at temperature T, and ρ is the electrical resistivity of sample.

8. COMPARATIVE METHOD

The method consists of placing a specimen with its temperature-monitoring thermocouple in a refractory container of low thermal conductivity and in turn placing this in a furnace whose temperature is maintained constant above or below the specimen temperature. The container is calibrated by determining its heating rate when empty and then with a reference sample of known specific heat. Separate electrical heating circuits are usually provided for the specimen and the shield so that their temperature will rise equally and simultaneously in order to reduce heat losses. The specific heat C_{p2} of the unknown specimen is calculated from the following relation:

$$\frac{C_{p2}W_2}{C_{p1}W_1} = \frac{\Delta t_2/\Delta T_2 - \Delta t_r/\Delta T_r}{\Delta t_1/\Delta T_1 - \Delta t_r/\Delta T_r} \tag{48}$$

where $(\Delta t/\Delta T)$ is the slope of a time–temperature curve, and the subscripts r, 1, and 2 represent the empty container, the container with specimen 1, and the container with specimen 2, respectively. The papers by Boggs and Wiebelt [3] and Smith [34] give excellent accounts in the use of this method.

Irreproducible heating or cooling conditions and differences in thermal conductivity between the unknown and reference specimen usually account for the inaccuracies encountered in this method.

Numerical Data

Data Presentation and Related General Information

1. SCOPE OF COVERAGE

The materials studied in this volume consist of metallic elements and their alloys.* The elements are listed in the table of contents in alphabetical order according to chemical name while the alloys are in alphabetical order according to the major constituent element. The data presented are original experimental data on the specific heat of these materials as reported by various investigators. These data were extracted from the world's technical and scientific literature, United States Government Publications, Doctoral and Masters dissertations, data supplied by private companies, and special reports of major research centers throughout the world. The range of temperatures covered is from zero degrees Kelvin to the melting point and beyond. For most high-temperature metals and alloys, no information is found in the liquid range.

2. PRESENTATION OF DATA

The data for all substances are presented in graphical and tabular form together with a specification table for each substance. The specification table gives the temperature range, the original reference number, the curve number, reported estimates of error, year of publication of the original document, specimen designation, and such other pertinent information as composition or purity of sample, test environment, mechanical, chemical, and thermal history of the test specimen, etc., to the extent provided in the original source document. The data for the specific heat of the materials are plotted on a log–log scale for comparative evaluation. When several sets of data are coincident, the graphical plotting of all of them would lead to confusion. For this reason, some of the sets of data points are omitted from the figures. They are, however, reported in the data tables and specification tables.

The numerical data are presented in double columns. The temperature T is in degrees Kelvin, and the specific heat C_p is in calories per gram per degree Kelvin. A unique curve number is assigned to each set of data. This corresponds exactly to the number which also appears in the specification table and on the figure.

The two general types of data that are obtainable from the literature are the true specific heat data obtained directly from the results of measurements using, for instance, the Nernst-type calorimeter and the derived true specific heat data, deduced from direct enthalpy measurements using the drop technique. In the latter type an empirical equation has been fitted by the authors to the enthalpy data by least squares technique and specific heat obtained by differentiation. The results are usually tabulated at rounded temperature intervals.

3. SYMBOLS AND ABBREVIATIONS USED IN THE FIGURES AND TABLES

Symbol	*Definition*	*Units*
T	Temperature	degree Kelvin, K
C_p	Constant pressure specific heat	cal g^{-1} K^{-1}
C_v	Constant volume specific heat	cal g^{-1} K^{-1}
M.P.	Melting point	degree Kelvin, K
T.P.	Transition point	degree Kelvin, K
s.c.	Superconducting	
N	Normal	
c	Cubic	
f.c.c.	Face-centered cubic	

---

*Boron, which is a nonmetal, has been included in this volume because of its extensive use as an alloying element for most metallic alloys. However, boron has also been listed in Volume 5, as a nonmetal.

			Fe	≠ C	> 0.2	≤ 0.6
			Fe	≠ C	> 0.2	> 0.6

*$X_1 \geq X_2 \geq X_3 \geq X_4 \ldots .$

†In case Mn, P, S, or Si represents X_2, this particular element is dropped from the last column. Alloy cast irons are also included in Group II of this category.

b.c.c.	Body-centered cubic
h	Hexagonal
c.p.h.	Close-packed hexagonal

4. CONVERSION FACTORS FOR UNITS OF SPECIFIC HEAT

The conversion factors given in the table on page 20a are based upon the following basic definitions:

$1 \text{ lb} = 0.45359237 \text{ kg}^*$

$1 \text{ cal}_{th} = 4.184 \text{ (exactly) J}^*$

$1 \text{ cal}_{IT} = 4.1868 \text{ (exactly) J}^*$

$1 \text{ Btu}_{th} \text{ lb}^{-1} \text{ F}^{-1} = 1 \text{ cal}_{th} \text{ g}^{-1} \text{ C}^{-1}\dagger$

$1 \text{ Btu}_{IT} \text{ lb}^{-1} \text{ F}^{-1} = 1 \text{ cal}_{IT} \text{ g}^{-1} \text{ C}^{-1}\dagger$

*National Bureau of Standards, "New Values for the Physical Constants Recommended by NAS-NRC," *NBS Tech. News Bull.* 47(10), 175–7, 1963.

†Mueller, E. F. and Rossini, F. D., "The Calory and the Joule in Thermodynamics and Thermochemistry," *Am. J. Phys.* 12(1), 1–7, 1944.

The subscripts "th" and "IT" designate "thermochemical" and "International Steam Table," respectively.

5. CLASSIFICATION OF MATERIALS

The classification scheme as shown in the table for metallic elements and alloys contained in this volume is based upon the chemical composition of the material. This scheme is mainly for the convenience of material grouping and data organization and is not intended to be used as definitions for the various material groups.

6. CONVENTION FOR BIBLIOGRAPHIC CITATION

For the following types of documents the bibliographic information is cited in the sequences given below.

Journal Article:

a. Author(s)—The names and initials of all authors are given. The last name is written first, followed by initials.
b. Title of article—In this volume, the titles of the journal articles listed in the *References to Text* are given, but not of those listed in the *References to Data Sources.*
c. Journal title—The abbreviated title of the journal as in *Chemical Abstracts* is given.
d. Series, volume, and number—If the series is designated by a letter, no comma is used between the letter for series and the numeral for volume, and they are underlined together. In case series is also designated by a numeral, a comma is used between the numeral for series and the numeral for volume, and only the numeral representing volume is underlined. No comma is used between the numerals representing volume and number. The numeral for number is enclosed in parentheses.
e. Pages—The inclusive page numbers of the article.
f. Year—The year of publication.

Report:

a. Author(s)
b. Title of report—In this volume, the titles of the reports listed in the *References to Text* are given, but not of those listed in the *References to Data Sources.*
c. Name of the responsible organization.
d. Report, or bulletin, circular, technical note, etc.
e. Number
f. Part
g. Pages
h. Year
i. ASTIA'S AD number—This is given in square brackets whenever available.

Book:

a. Author(s)
b. Title
c. Volume
d. Edition
e. Publisher
f. Place of publication

h. Year

7. CRYSTAL STRUCTURES, TRANSITION TEMPERATURES, AND OTHER PERTINENT PHYSICAL CONSTANTS OF THE ELEMENTS

The table on the following pages contains information on the crystal structure, transition temperatures, and certain other pertinent physical constants of each element. This information is very useful in data analysis and synthesis. However, no attempt has been made to critically evaluate the temperatures/constants given in the table and they should not be considered recommended values. This table has an independent series of numbered references which immediately follow the table.

CRYSTAL STRUCTURES, TRANSITION TEMPERATURES, AND OTHER PERTINENT PHYSICAL CONSTANTS OF THE ELEMENTS

Name	Atomic Number	Atomic^{a} Weight	Density,^{b} kg m^{-3}·10^{-3}	Crystal Structure	Phase Transition Temp., K	Superconducting Transition Temp., K	Curie Temp., K	Néel Temp., K	Debye Temperature at 0 K, K	Debye Temperature at 298 K, K	Melting Point, K	Boiling Point, K	Critical Temp., K

---

[a] Atomic weights are based on $^{12}C = 12$ as adopted by the International Union of Pure and Applied Chemistry in 1961; those in parentheses are the mass numbers of the isotopes of longest known half-life.

[b] Density values are given at 293.2 K unless otherwise noted.

[c] Superscript numbers designate references listed at the end of the table.

[d] Close-packed hexagonal crystalline modification of chromium may be formed by electrodeposition below 293 K under special conditions of deposition process. This c.p.h. form is unstable and will irreversibly transform into b.c.c. form on heating.

FIGURE SHOWS ONLY 5 OF THE CURVES REPORTED IN TABLE

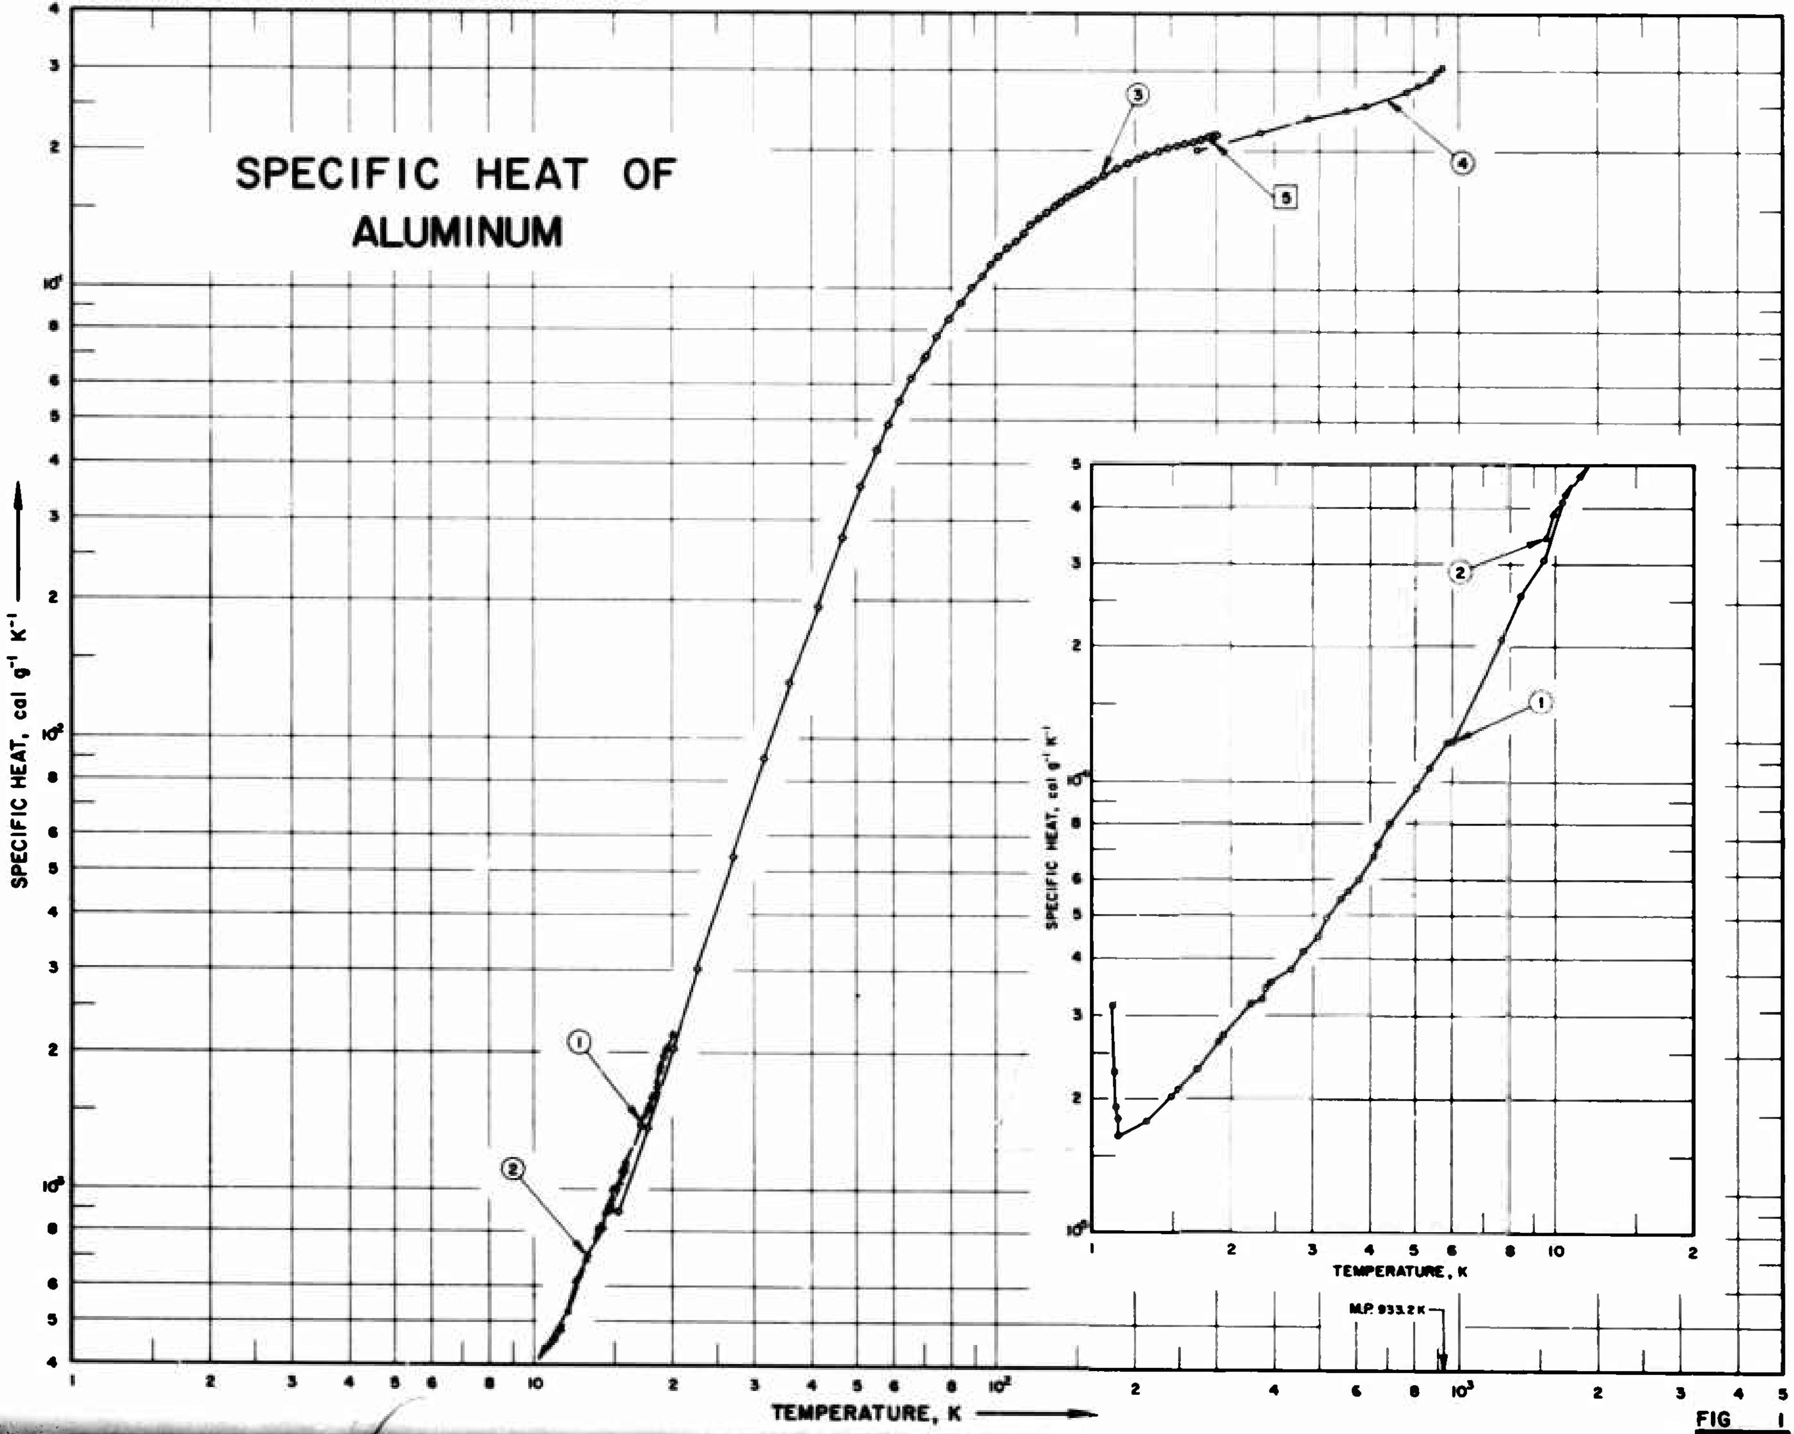

FIG 1

SPECIFICATION TABLE NO. 1 SPECIFIC HEAT OF ALUMINUM

(Impurity <0.20% each; total impurities <0.50%)

[For Data Reported in Figure and Table No. 1]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	2	1937	1.1-19			99.7 Al; liquid helium atmosphere.
2	2	1937	15-20			99.7 Al; solid and liquid hydrogen atmosphere.
3	4	1941	15-302	0.1-3.0		99.944 Al; sample supplied by the Research Lab of the Aluminum Company of America; melted, and cooled for 2 days to produce single crystals.
4	3	1953	273-923	<5.0	Al - wire	99.9 Al, 0.05 SiO_2, and 0.03 B.
5	1	1961	295	±5.0		
6	5	1962	1.1-1.2	0.88		99.995 Al, 0.00025 Fe, <0.0001 Si, and 0.00005 Cu; 1.4 x 10^{-6} mm Hg vacuum; melted, etched in dilute aqua regia, annealed under vacuum at 600 C for 91 hrs and cooled gradually to room temperature during 24 hrs; etched again for 10 min; annealed for 165 hrs at 585 C and cooled gradually to room temperature during 114 hrs.
7	6	1962	1.17-1.18	±3.0	Al - I	99.99 Al, 0.009 Si, 0.001 Mg, <0.0008 Cu, <0.0006 Fe, and 0.0003 Mn; two large single crystals; zone-refined.
8	6	1962	1.18-1.19	±3.0	Al - II	99.99 Al, 0.01 Si, 0.001 Mn, 0.0005 Ti, <0.0005 Cu, <0.0005 Fe, and 0.0002 Mg; about 6 single crystals of equal size; zone-refined.
9	6	1962	1.18-1.19	±3.0	Al - III	99.99 Al, 0.009 Si, 0.004 Mg, 0.001 Mn, 0.0005 Ti, <0.0005 Cu, and <0.0005 Fe; polycrystalline.
10	102	1962	323-573	3.0-5.0		
11	5	1962	1.0-1.2	0.88	Superconducting	99.995 Al, 0.00025 Fe, <0.0001 Si, and 0.00005 Cu; 1.4 x 10^{-6} mm Hg vacuum; melted, etched in dilute aqua regia, annealed under vacuum at 600 C for 91 hrs and cooled gradually to room temperature during 24 hrs; etched again for 10 min; annealed for 165 hrs at 585 C and cooled gradually to room temperature during 114 hrs.
12	6	1962	1.1-1.2	±3.0	Al - III cooling	99.99 Al, 0.009 Si, 0.004 Mg, 0.001 Mn, 0.0005 Ti, <0.0005 Cu, and <0.0005 Fe; polycrystalline.
13	179	1924	373-873	1		NBS standard.
14	261	1934	55-296			99.985 Al; annealed; heated in high vacuum for 18 hrs at 460 C.
15	261	1934	56-291			99.985 Al; single crystal; hard drawn aluminum.
16	262	1937	398-673			
17	263	1939	373-873			
18	264	1951	90-373			99.5 Al.
19	265	1959	0.1-4.0	<0.5		99.998 Al, 0.002 Cu; polycrystalline with grain size 3-5 mm; cast in a vacuum; vacuum annealed at 450 C for 48 hrs; 300 gauss magnetic field.
20	265	1959	0.2-1.2	<0.5		Same as above; zero magnetic field; superconducting.

FIGURE SHOWS ONLY 2 OF THE CURVES REPORTED IN TABLE

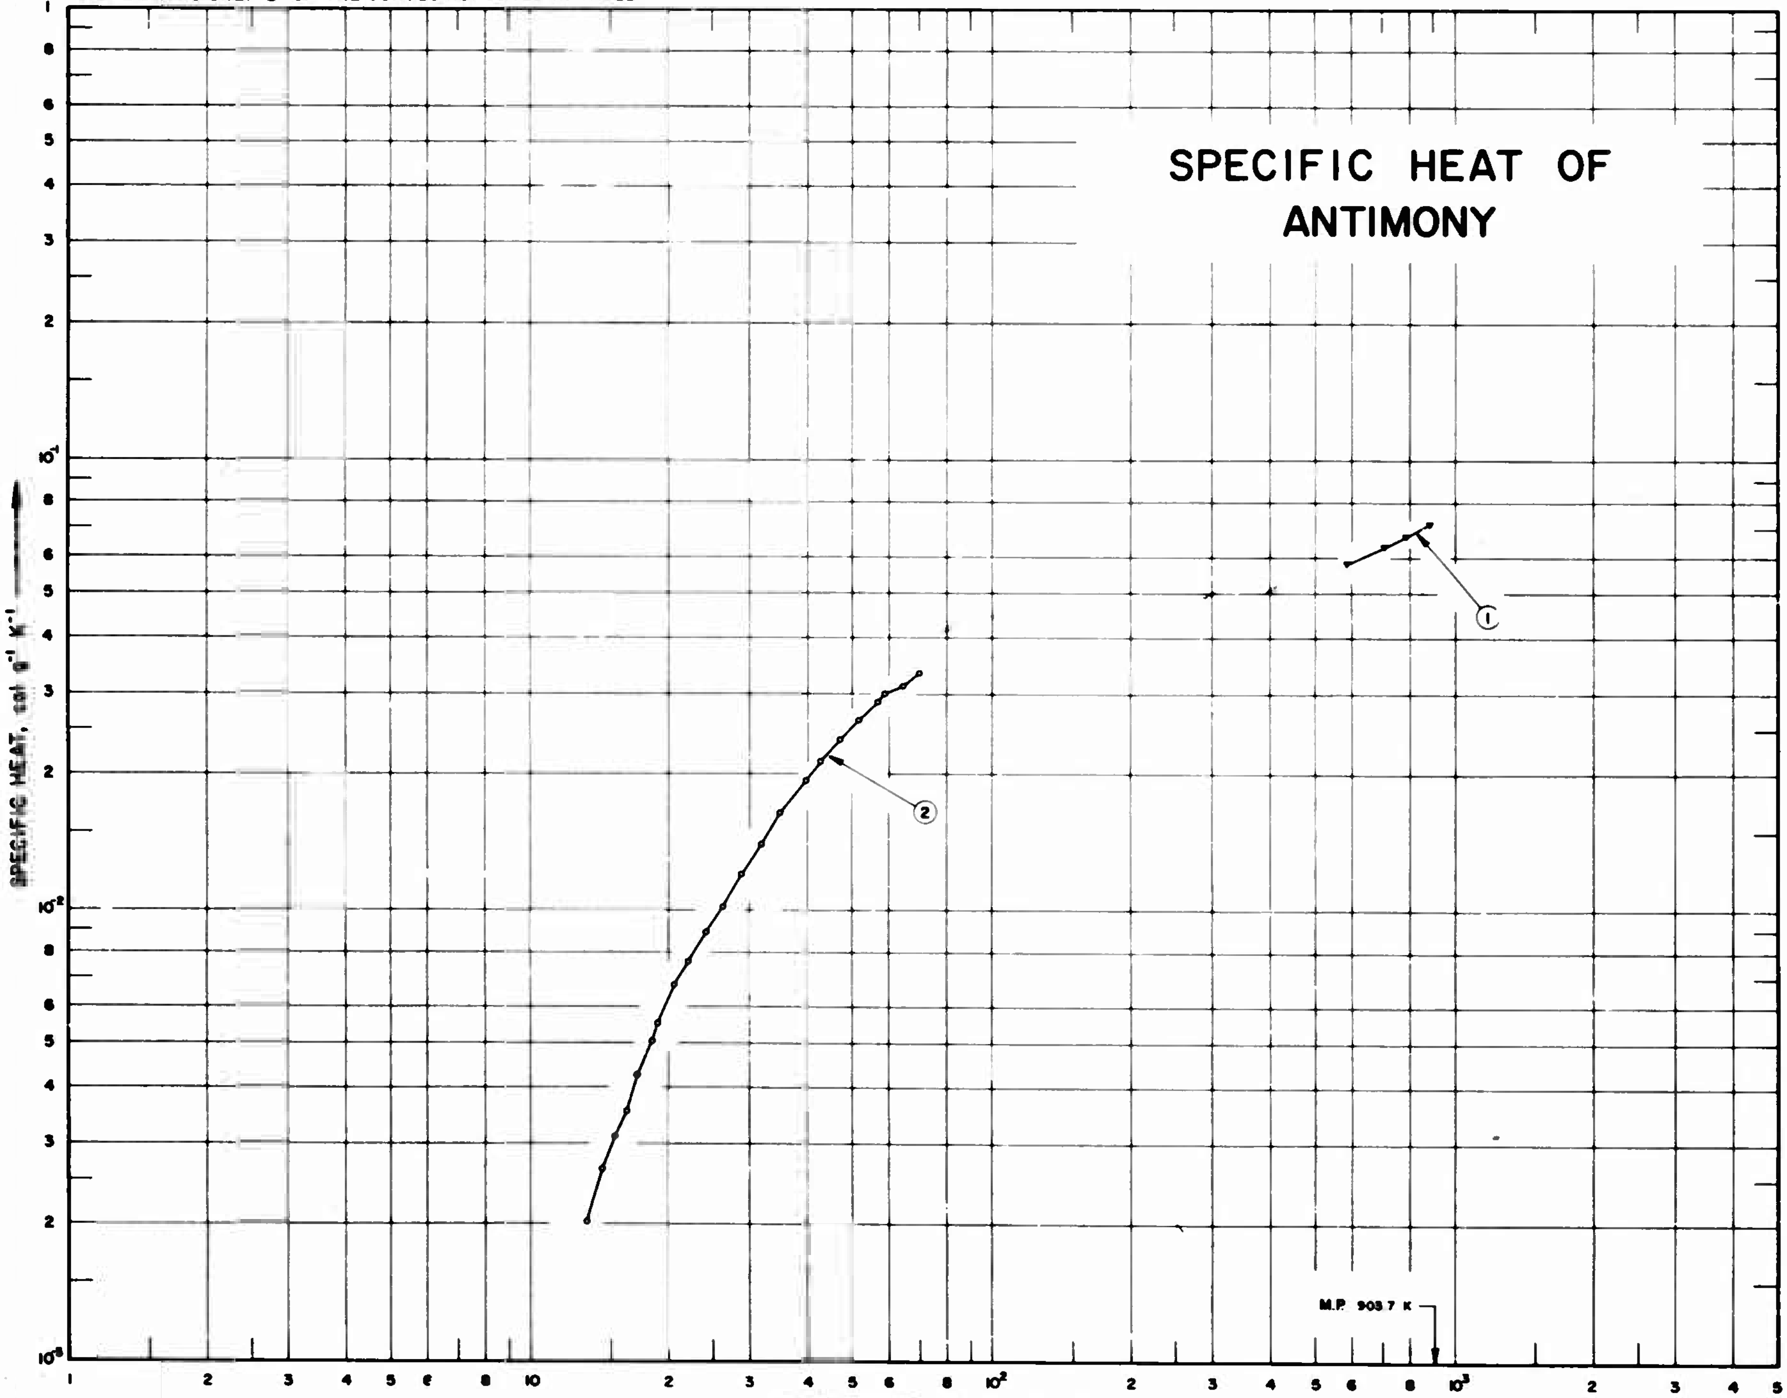

FIG 2

SPECIFICATION TABLE NO. 2 SPECIFIC HEAT OF ANTIMONY

(Impurity <0.20% each; total impurities <0.50%)

[For Data Reported in Figure and Table No. 2]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	152	1961	587-885	≤0.2		99.99 Sb; purified by zone recrystallization.
2	152	1953	13-70			99.90 Sb, 0.03 As, 0.015 Fe, 0.015 S, and 0.01 Pb; sample supplied by the Johnson, Matthey Co.
3	267	1920	80-98			
4	268	1926	373-1273			99.735 Sb, 0.145 S, 0.06 Fe, 0.04 Pb, and 0.02 Cu.
5	180	1930	56-293	1		<0.2 total of As, Pb, and insoluble matter; density = 6.74 g cm^{-3} at 24.1 C.

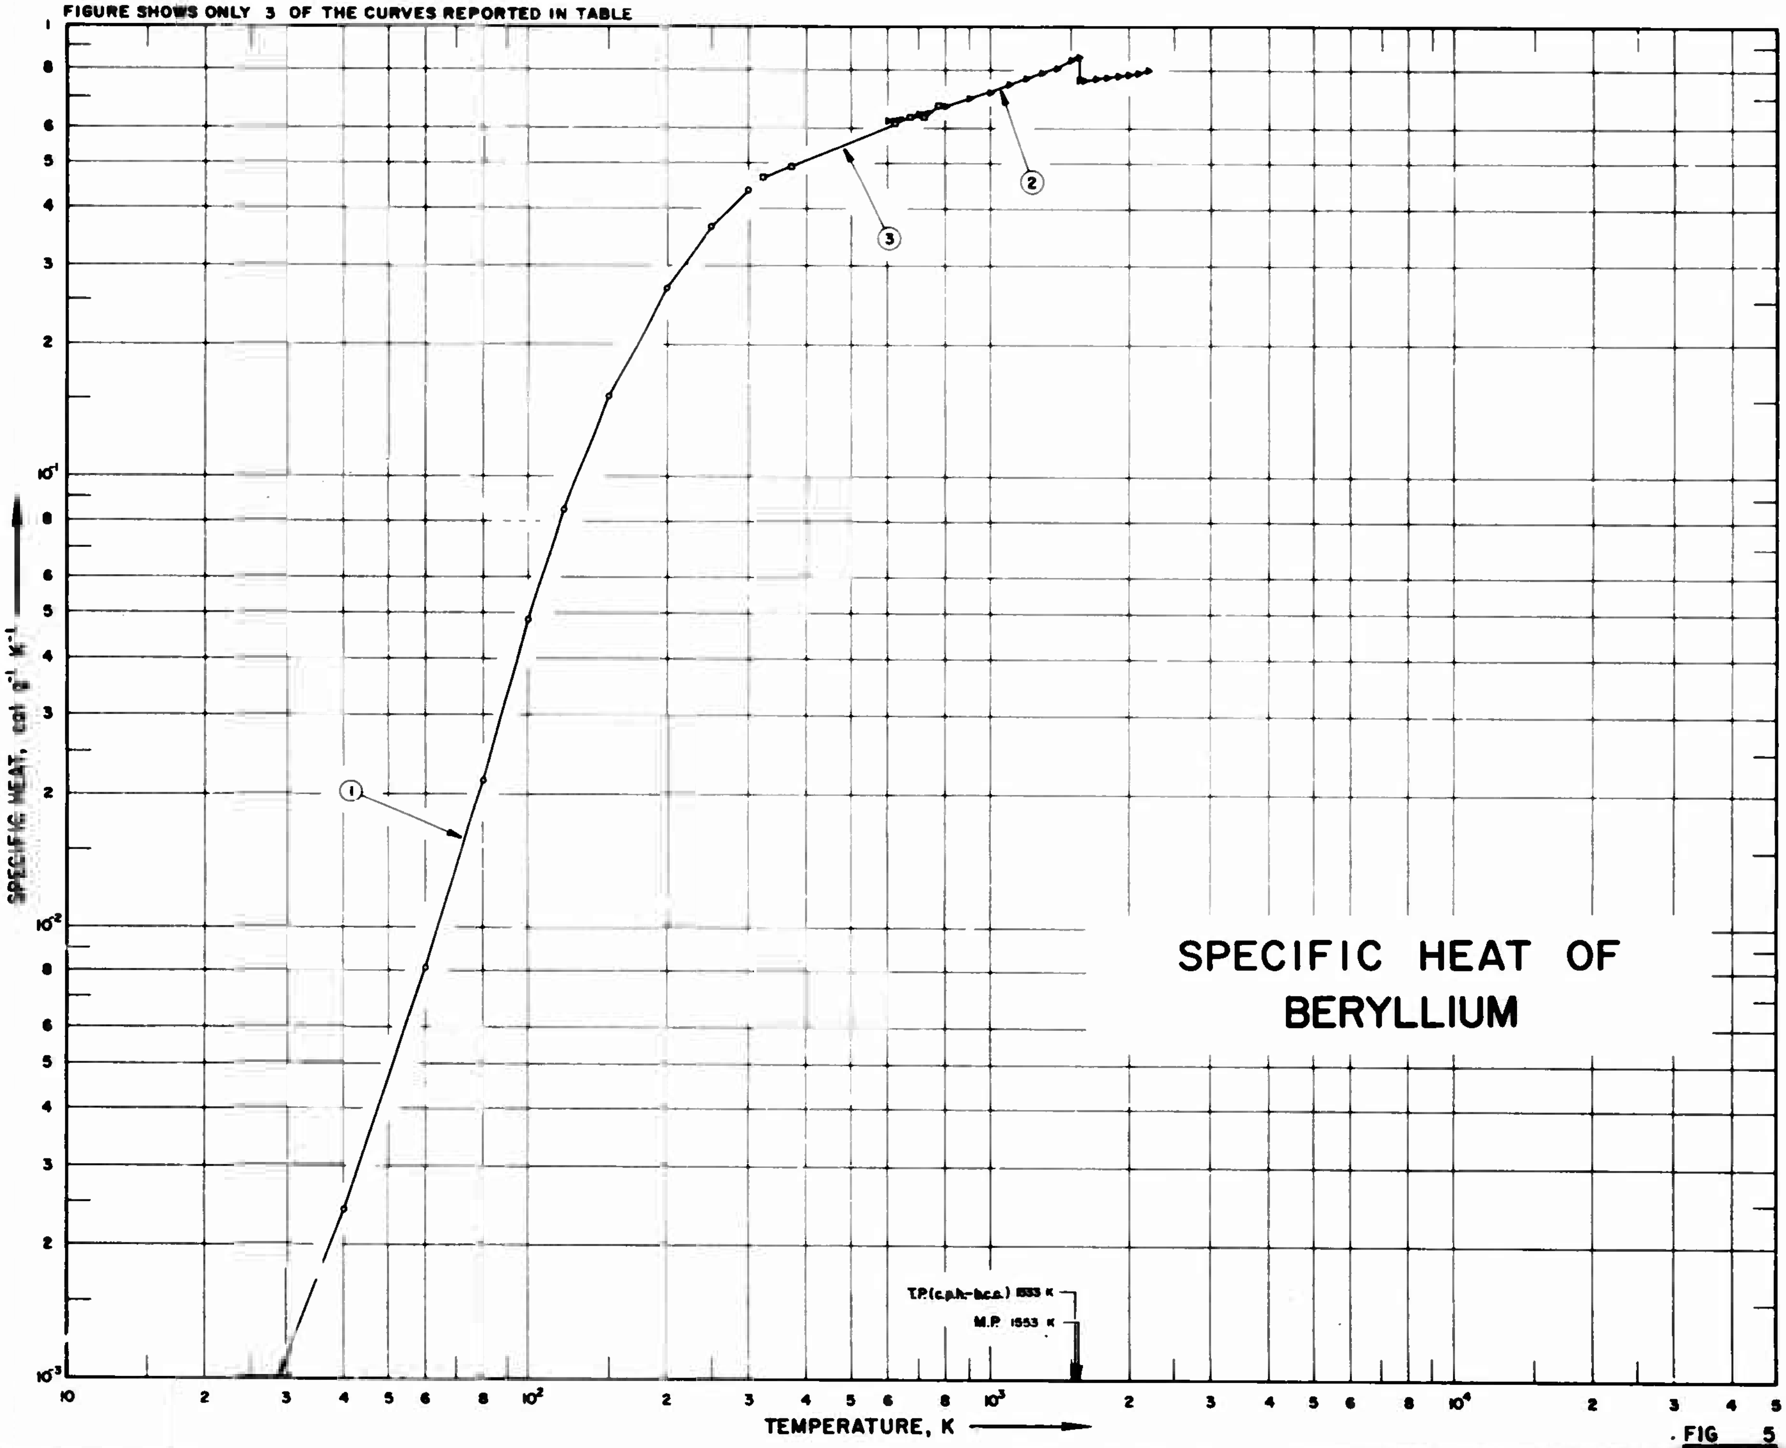
FIGURE SHOWS ONLY 3 OF THE CURVES REPORTED IN TABLE



SPECIFIC HEAT OF BERYLLIUM

FIG 5

SPECIFICATION TABLE NO. 5 SPECIFIC HEAT OF BERYLLIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 5]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	78	1953	5-30			99.5 Be, 0.15 Cl, 0.10 O and 0.05 others; prepared from powder by high temperature extrusion process.
2	79	1961	600-2200			99.8 Be; pulverized and tightly filled into ampules; measured under 10-15 mm Hg argon atmosphere.
3	7	1959	323-773	1.8-2.0		99.8 Be.
4	269	1966	1.3-20		Sample I	Obtained by seven zone-refining passes from vacuum distilled starting material; sample supplied by Nuclear Metals Inc; Sample I included polycrystalline trailing end of the zone-refining; the portion of Sample I which was single crystal had a resistance ratio of $\frac{R_{298}}{R_{4.2}}$ = 380.
5	269	1966	1.3-30		Sample II	Obtained by seven zone-refining passes from vacuum distilled starting material; sample supplied by Nuclear Metals Inc; Sample II was spark cut from center section of the rod; single crystal had resistance ratio of $\frac{R_{298}}{R_{4.2}}$ = 1100.
6	201	1929	373-1173			
7	270	1929	98-463			Commercially pure Be, traces of Al, Mn, and Cr, also small traces of Fe, Mg, and Si, the total about 0.5%; sample supplied by Beryllium Company of America.
8	271	1931	286			
9	272	1934	273-1073	1.0-1.2		Pure crystallized Be lumps.
10	273	1939	303-1073			99.962 Be.
11	273	1939	303-473			99.781 Be.

FIG 6

SPECIFICATION TABLE NO. 6 SPECIFIC HEAT OF BISMUTH

(Impurity $<0.20\%$ each; total impurities $<0.50\%$)

[For Data Reported in Figure and Table No. 6]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	90	1958	21-105			0.00005 Cu.
2	60	1949	15-21	0.6		99.998 Bi.
3	91	1964	11-271			99.9 Bi.
4	268	1928	348-873			99.85 Bi, 0.1 Cu, 0.015 Fe, and 0.01 Al.
5	274	1927	272-426			
6	275	1930	61-298			High purity sample supplied by American Smelting and Refining Co.; density = 9.86 g cm^{-3} at 20.6 C.
7	276	1930	3.6-19			Sample supplied by Kahlbaum and Co.
8	277	1932	306-644			0.1 Pb, 0.002 Ag and very minute traces of Ca, Fe, Mg, Na, Ni, Sn, and Th.
9	278	1938	193-393	0.1		<0.02 S, 0.0022 Cu, <0.002 Pb, and <0.00005 As; sample supplied by the Consolidated Mining and Smelting Co.
10	266	1954	0.9-5.0			99.99 Bi; polycrystalline; resistance ratio: $\frac{R_{4.2}}{R_{273}} = 0.112$.
11	280	1960	545-802			99.9999 Bi, and trace of Fe; pelleted sample supplied by Consolidated Mining and Smelting Co.

SPECIFIC HEAT OF BORON

CONTINUED FROM FIGURE 7-1

FIG 7-2

SPECIFICATION TABLE NO. 7 SPECIFIC HEAT OF BORON

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 7]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	92	1951	18-308			Extremely pure; amorphous.
2	92	1951	17-304			Extremely pure; crystalline; heated under vacuum to 1700-1900 C.
3	102	1960	298-1200		Boron III	0.08 Si, 0.06 Na, 0.04 Fe and 0.02 Ni; amorphous; sample supplied by the Fairmount Chemical Company; sealed in gold ampules.

SPECIFIC HEAT OF CADMIUM

FIG 8

SPECIFICATION TABLE NO. 8 SPECIFIC HEAT OF CADMIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 8]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	48	1953	12-320	0.10		99.9 Cd.
2	47	1957	298-543	0.4		99.9 Cd.
3	281	1956	513-688			
4	189	1923	70-298	1.0		Analyzed as being a very high purity sample.
5	282	1924	10-373			
6	268	1926	348-923			99.959 Cd, with 0.02 Al, and Fe, also 0.001 Cu.
7	283	1928	10-594			
8	182	1936	193-383	0.05-0.1		99.97 Cd, with 0.022 Zn, 0.01 Pb, 0.002 Cu, and 0.0001 Fe.
9	284	1956	1.5-20			99.99 Cd; sample supplied by Johnson, Matthey and Co.

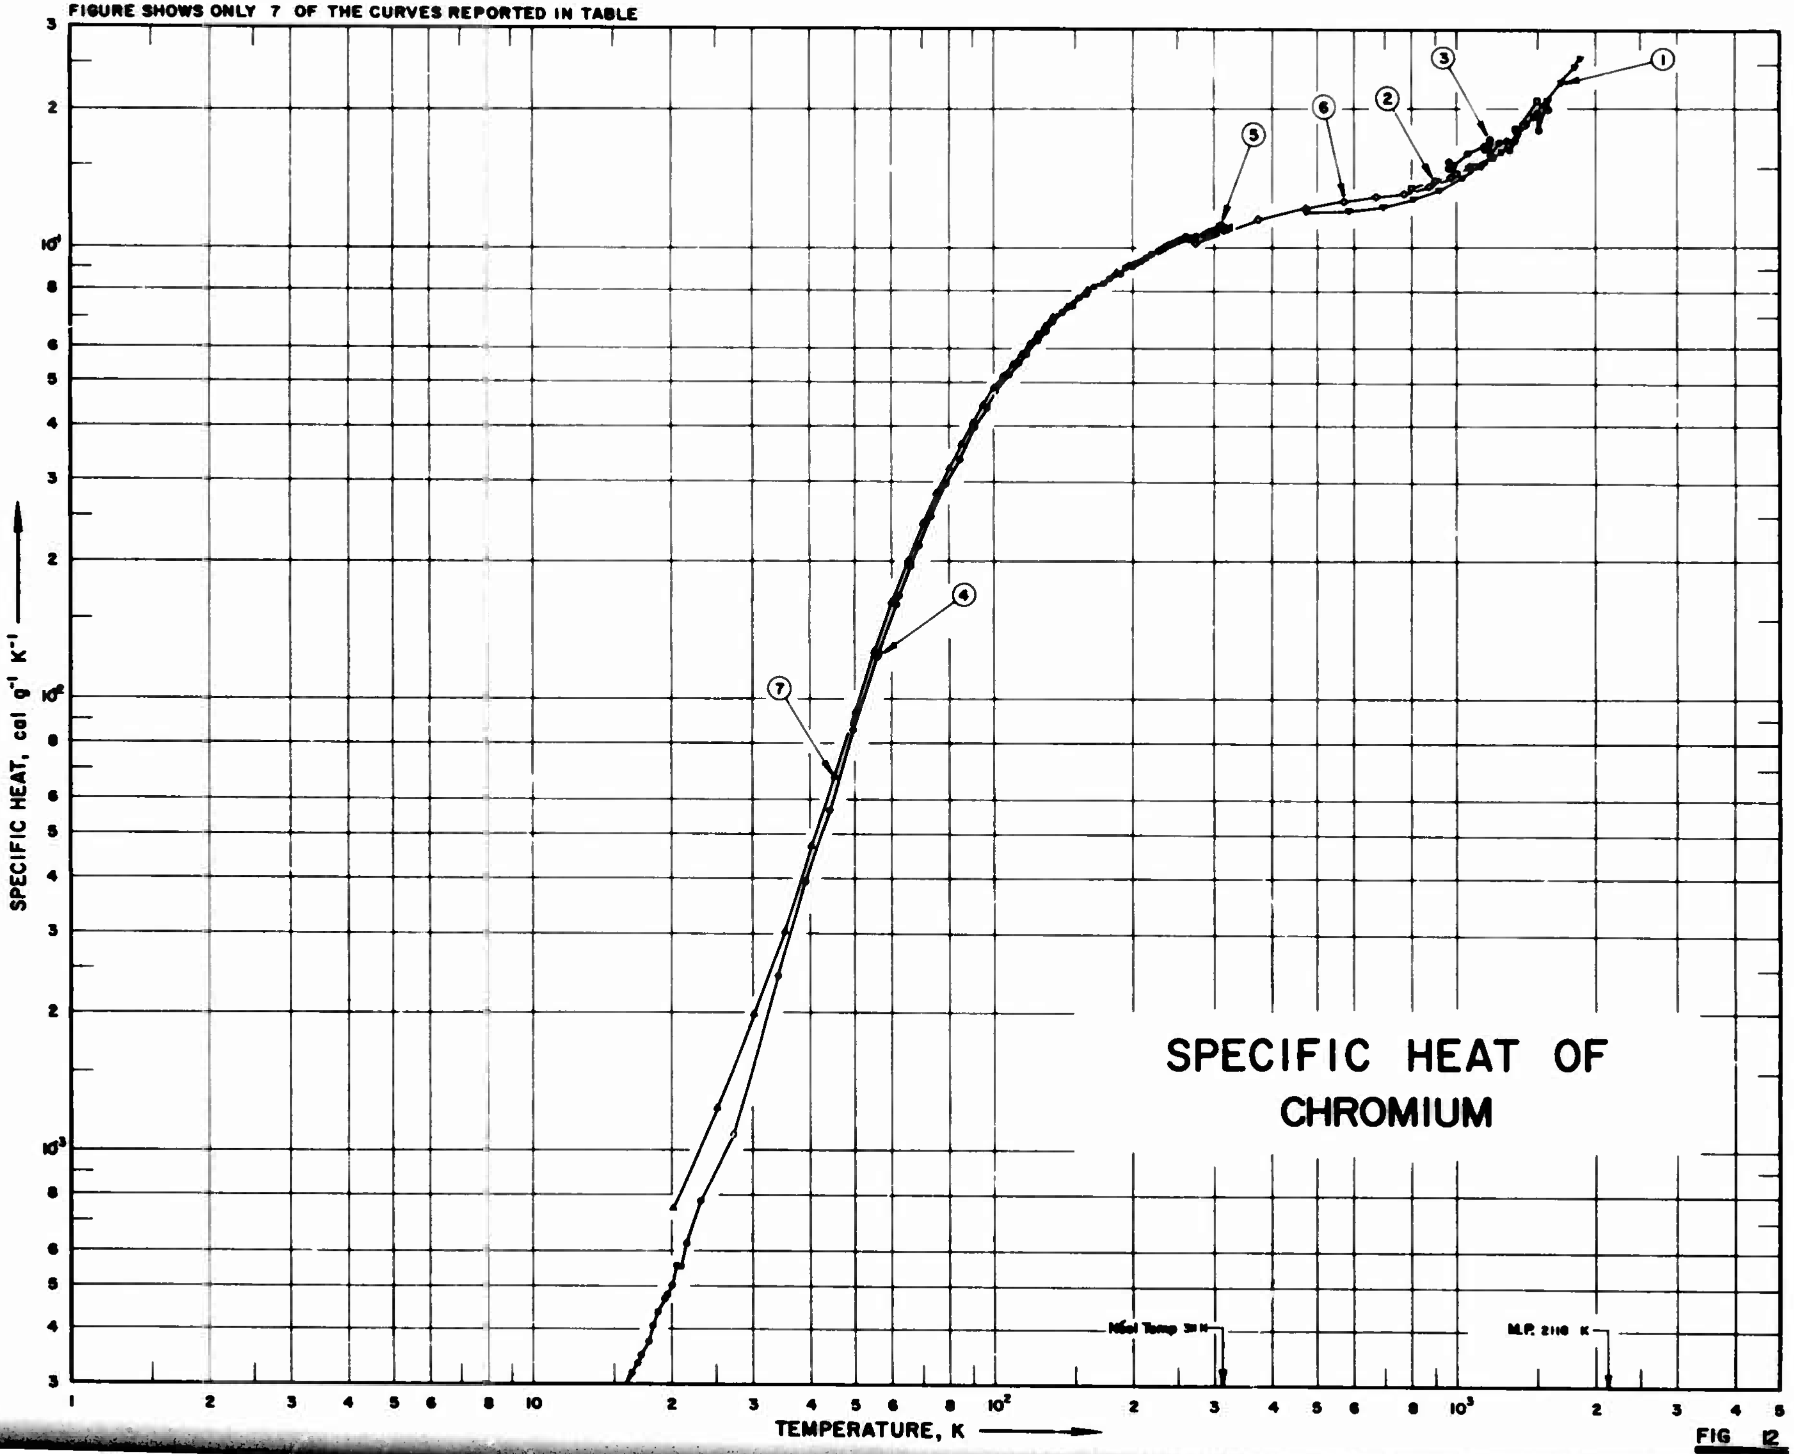
FIGURE SHOWS ONLY 7 OF THE CURVES REPORTED IN TABLE



SPECIFIC HEAT OF CHROMIUM

FIG 12

SPECIFICATION TABLE NO. 12 SPECIFIC HEAT OF CHROMIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 12]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	10	1958	297-1922			Chemically pure; ductile; specimen sealed in capsule; density = 448 lb ft^{-3} at 75 F.
2	20	1959	800-1500	± 0.3		100 Cr; specimen under argon atmosphere.
3	13	1958	964-1598	0.7-2.0		99.96 Cr, 0.04 O_2.
4	22	1962	14-274			99.9 Cr.
5	23	1960	268-324	0.13	Ductile Chromium	99.998 Cr; specimen produced by Aeronautic's Research Laboratory, Melbourne.
6	24	1950	273-1073	1.0		0.1 impurities, mostly chromous oxide with absorbed H_2 and some Ca and Na; electrolytic flakes.
7	25	1954	20-200			99.9 Cr.
8	125	1965	1273-2103	1.42		99.99 Cr; form of crystals made by vapor decomposition of the iodide.
9	287	1937	56-291			Electrolytic Cr; after treatment specimen contained 0.65 O_2, assumed to be in the form of Cr_2O_3; evacuated and heated to 1100 C to remove H_2; corrected for Cr_2O_3 impurities.
10	288	1952	1.8-4.0			99.9 Cr.

SPECIFICATION TABLE NO. 13 SPECIFIC HEAT OF COBALT

(Impurity <0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 13]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	93	1940	448- 1673			99.95 Co, 0.01-0.06 Fe; deposited electrolytically; density = 551 lb ft^{-3}.
2	24	1950	273-1073		Electrolytic	< 0.01 impurities.
3	94	1952	14-270			96.95 Co, 2.50 Fe, 0.25 Cu, 0.20 Ni, 0.08 Si, 0.01 Mn; data corrected for impurities; density = 551 lb ft^{-3}.
4	31	1959	413-1073	1.0		Sealed in argon.
5	164	1932	273-1473			
6	223	1959	0.3-1	~5		99.9 Co, with the principal impurity Fe; hexagonal closed packed; sample supplied by African Metals Corporation.

SPECIFIC HEAT OF COPPER

FIG 14

SPECIFICATION TABLE NO. 14 SPECIFIC HEAT OF COPPER

(Impurity $< 0.20\%$ each; total impurities $< 0.50\%$)

[For Data Reported in Figure and Table No. 14]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	8	1960	20-300	<2.0		99.999 Cu; sample-supplied by American Smelting and Refining Co.; heavily cold worked below room temperature with hydraulic press until strength increased 50%.
2	9	1959	288-701			
3	11	1958	366-1310			Electrolytic tough-pitch copper; cold drawn; under helium atmosphere; density = 40 lb ft^{-3} at 75 F.
4	11	1961	366-544		Calibration Specimen	
5	12	1962	533-1089	≤5.0		100.0 electrolytic copper.
6	1	1961	295	±5.0		
7	14	1959	5-298		OFHC	99.96 Cu, 0.001-0.01 Ag, 0.001-0.01 Sb, <0.001 each, Bi, Ca, Fe, Mg, Ni, Pb, and Si; oxygen free high conductivity copper.
8	15	1959	323-1273	1.0		99.9 Cu.
9	16	1961	0.4-30	1.0	High purity copper	99.999 Cu, <0.0001 each Se and S; sample supplied by the American Smelting & Refining Co.
10	17	1960	421			
11	8	1960	20-300	<2.0	I (a)	Commercially pure cold rolled copper; sample supplied by the American Smelting & Refining Co.
12	8	1960	20-280	<2.0	I (b)	Same as above.
13	8	1960	20-290	<2.0	II	Lighter commercially pure cold-rolled copper; sample supplied by the American Smelting & Refining Co.
14	8	1960	20-300	<2.0		99.999 Cu; annealed; melted by induction heating under high vacuum and cooled slowly for 4 hrs.
15	18	1956	363-873	±0.5	Electrolytic copper	99.99 Cu, major metallic impurities are Ag and Fe.
16	16	1961	0.4-30	1.0	0.05 Fe dilute copper alloy	99.949 Cu, <0.0001 each Se, and S; melted and cooled to room temperature.
17	16	1961	0.4-30	1.0	0.10 Fe dilute copper alloy	99.899 Cu, <0.0001 each Se, and S; melted at 1300 C; annealed for 72 hrs at 870 C to homogenize; cooled rapidly to room temperature.
18	19	1962	473-973		Copper powder compact first heating	99.8 Cu; reduced for 3 hrs. at 250 C in dry and purified hydrogen stream; heated under 10^{-4} mm Hg vacuum at 400 C until degassing from powder is completed.
19	19	1962	513-893		Copper powder compact second heating	Same as above.
20	4	1941	15-300			99.96 Cu; single crystals; melted and solidified 5 days in a nitrogen atmosphere; density = 558.91 lb ft^{-3}.

SPECIFICATION TABLE NO. 14 (continued)

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
21	21	1956	811-1311		QQC 576	Electrolytic tough pitch; density = 551.4 lb ft^{-3}.
22	37	1962	284-300	0.10		99.999 Cu; annealed.
23	37	1962	284-303	0.10		99.999 Cu; cold worked.
24	38	1961	727-1783			
25	101	1958	337-946			Specimen's surface plated with platinum black.
26	105	1948	589-794			99.92 Cu; capsule.
27	55	1930	95-215	1.5	Recrystallized copper	Cold deformed; recrystallized for 10 hrs at 1000 C under nitrogen atmosphere.
28	55	1930	84-183	1.5	Compressed copper	Deformed by hydraulic press sidewise.
29	154	1956	273-1338		QQC 502	Electrolytic; tough pitch.
30	83	1954	373-1183			
31	268	1926	373-1723			Electrolytic copper.
32	289	1927	373-1073			0.1 Ni; vacuum melted.
33	170	1931	291-973		Electrolytic copper	
34	290	1936	573-1173		Electrolytic copper	Sample melted and allowed to solidify.
35	291	1933	203-389	0.05		>99.5 Cu; cold rolled.
36	261	1934	54-294			Hard drawn wire sample from Bell Telephone.
37	261	1934	53-293			Sample annealed 16 hrs at 400 C in high vacuum.
38	167	1936	1.2-20			99.9 Cu.
39	262	1937	373-764			
40	292	1937	29-194	0.05		Commercially pure sample; cold rolled.
41	263	1939	373-1273			
42	293	1941	82-273			99.92 Cu, with 0.02 Fe, 0.01 C, and 0.003 S impurities.
43	294	1952	2.1-4			99.60 Cu, with principal impurity Pb, and traces of Fe, Ni, and Ag.
44	295	1955	90-300		Sample I	99.999 Cu, single crystal; before deformation copper was annealed at 400 C.
45	295	1955	90-300		Sample II	Polycrystalline; before deformation copper was annealed at 400 C.
46	296	1955	1.1-4.8	.05		99.999$^+$ Cu, with a trace of Ag; sample was supplied by the American Smelting and Refining Company; annealed 3 hrs at 1000 C under vacuum of 1 x 10^{-6} mm Hg, and allowed to cool in vacuum to room temperature at 200 C per hr.

SPECIFICATION TABLE NO. 14 (continued)

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
47	223	1959	0.4-0.5	5		
48	297	1959	2.7-5		OFHC copper	Annealed at 300 C for 1 hr.
49	298	1963	77-1357			
50	85	1963	0.1-1.1			99.999 Cu, specimen supplied by American Smelting and Refining Co.; sample was annealed in vacuum several hours at 600 C.
51	299	1964	0.1-1.0	1-3		
52	300	1966	1-9	0.1		Single crystal; resistance ratio $\frac{R_{300}}{R_{4.2}}$ = 3000-6000; etched.
53	300	1966	1-24	0.1		99.999 Cu, polycrystalline sample supplied by American Smelting and Refining Co.; annealed 3 1/2 hrs at 650 C in a vacuum by induction heating and heavily etched; the pressure before heating was 5 x 10^{-9} mm Hg, pressure during heating increased to a maximum 6 x 10^{-6} and decreased to 2 x 10^{-8} mm Hg.
54	300	1966	1-27	0.1	Standard 19th Annual Calorimetry Conference Sample	Chill cast sample; heavily etched.
55	300	1966	1-24	0.1		Cold worked sample; prepared from annealed sample; heavily etched.

SPECIFIC HEAT OF GERMANIUM

FIGURE SHOWS ONLY 5 OF THE CURVES REPORTED IN TABLE

FIG 20

SPECIFICATION TABLE NO. 20 SPECIFIC HEAT OF GERMANIUM

(Impurity <0.20% each; total impurities <0.50%)

[For Data Reported in Figure and Table No. 20]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	40	1959	2-300	±2.0		Sample supplied by Societe des Mines et Founderies de Zinc de la Vielle Montagne, Belgium; broken into pieces of 3 mm size; evacuated to a pressure of 10^{-6} mm Hg and then sealed with a small amount of helium exchange gas inside.
2	41	1959	80-300	≤7.0		Single crystals; p-type.
3	42	1964	296-884	≤3.0		Resistivity 0.01 ohm-cm; n-type.
4	43	1952	5-160	±1.0		Spectroscopically pure.
5	44	1952	20-200			Pure sample (2.8×10^{14} impurity centers cm^{-3} (298 K).
6	44	1952	20-200			Intermediate purity (9.5×10^{17} impurity centers cm^{-3} (302 K); n-type.
7	44	1952	20-200			0.00223 Al (2.2×10^{20} impurity centers cm^{-3} (297 K); p-type.
8	302	1934	10-200			
9	303	1963	12-273	≤2.0		Single crystals.
10	304	1966	298-1500	±0.3		99.99^+ Ge; specimen under vacuum.

SPECIFIC HEAT OF GOLD

FIG 21

SPECIFICATION TABLE NO. 21 SPECIFIC HEAT OF GOLD

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 21]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	96	1952	16-309			99.99 Au; single crystal.
2	101	1958	400-1164			Pure; specimen's surface plated with platinum black.
3	268	1926	373-1498			
4	207	1928	15-213			
5	290	1932	473-1236			Specimen was in a perfectly pure state.
6	305	1955	1-5	0.5		99.99⁺ Au, with traces of Cu, Fe, Mg, Si, Sn and Ag, sample supplied by J. Bishop and Co.; vacuum melted from gold sponge; annealed under vacuum of 1 x 10^{-6} mm Hg for 4 hrs at 950 C and cooled in vacuo at the rate of 200 C per hr.
7	306	1963	13-273	<0.5		99.99 Au.
8	184	1966	3-30	±0.5		Semiquantitative spectrographic analysis: <0.00005 Ag, 0.00003 Mg, 0.00002 Si, <0.00002 Cu, and <0.00001 Fe; large crystals; annealed condition.

SPECIFIC HEAT OF HOLMIUM

FIG 23

SPECIFICATION TABLE NO. 23 SPECIFIC HEAT OF HOLMIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 23]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	219	1957	15-300	0.3-2		0.2 Si, 0.15 Ca, <0.2 Fe, <0.1 Ta, <0.05 Dy, <0.02 Y, <0.01 Mg, Fr, and Tm; sample prepared by ion exchange separation and reduction of anhydrous fluoride with Ca; sublimed at 7500 C and 10^{-5} mm Hg vacuum.
2	220	1964	0.1-0.7			Hexagonal closed packed.
3	258	1962	0.3-4.0	0.2-3		0.21 O_2, 0.07 Na, 0.07 C, and 0.005 H_2; sample supplied by Research Chemicals Inc.
4	301	1966	298-1800	<2		0.03 Ca, 0.012 N_2, 0.005 Al, Cr, Fe, and Mg, and 0.002 O_2; prepared by metallothermic reduction of the fluoride with calcium and purified by distillation.
5	380	1966	3-24	0.6-2.0		0.21 O_2, 0.007 C, 0.007 N_2, and 0.005 H_2.

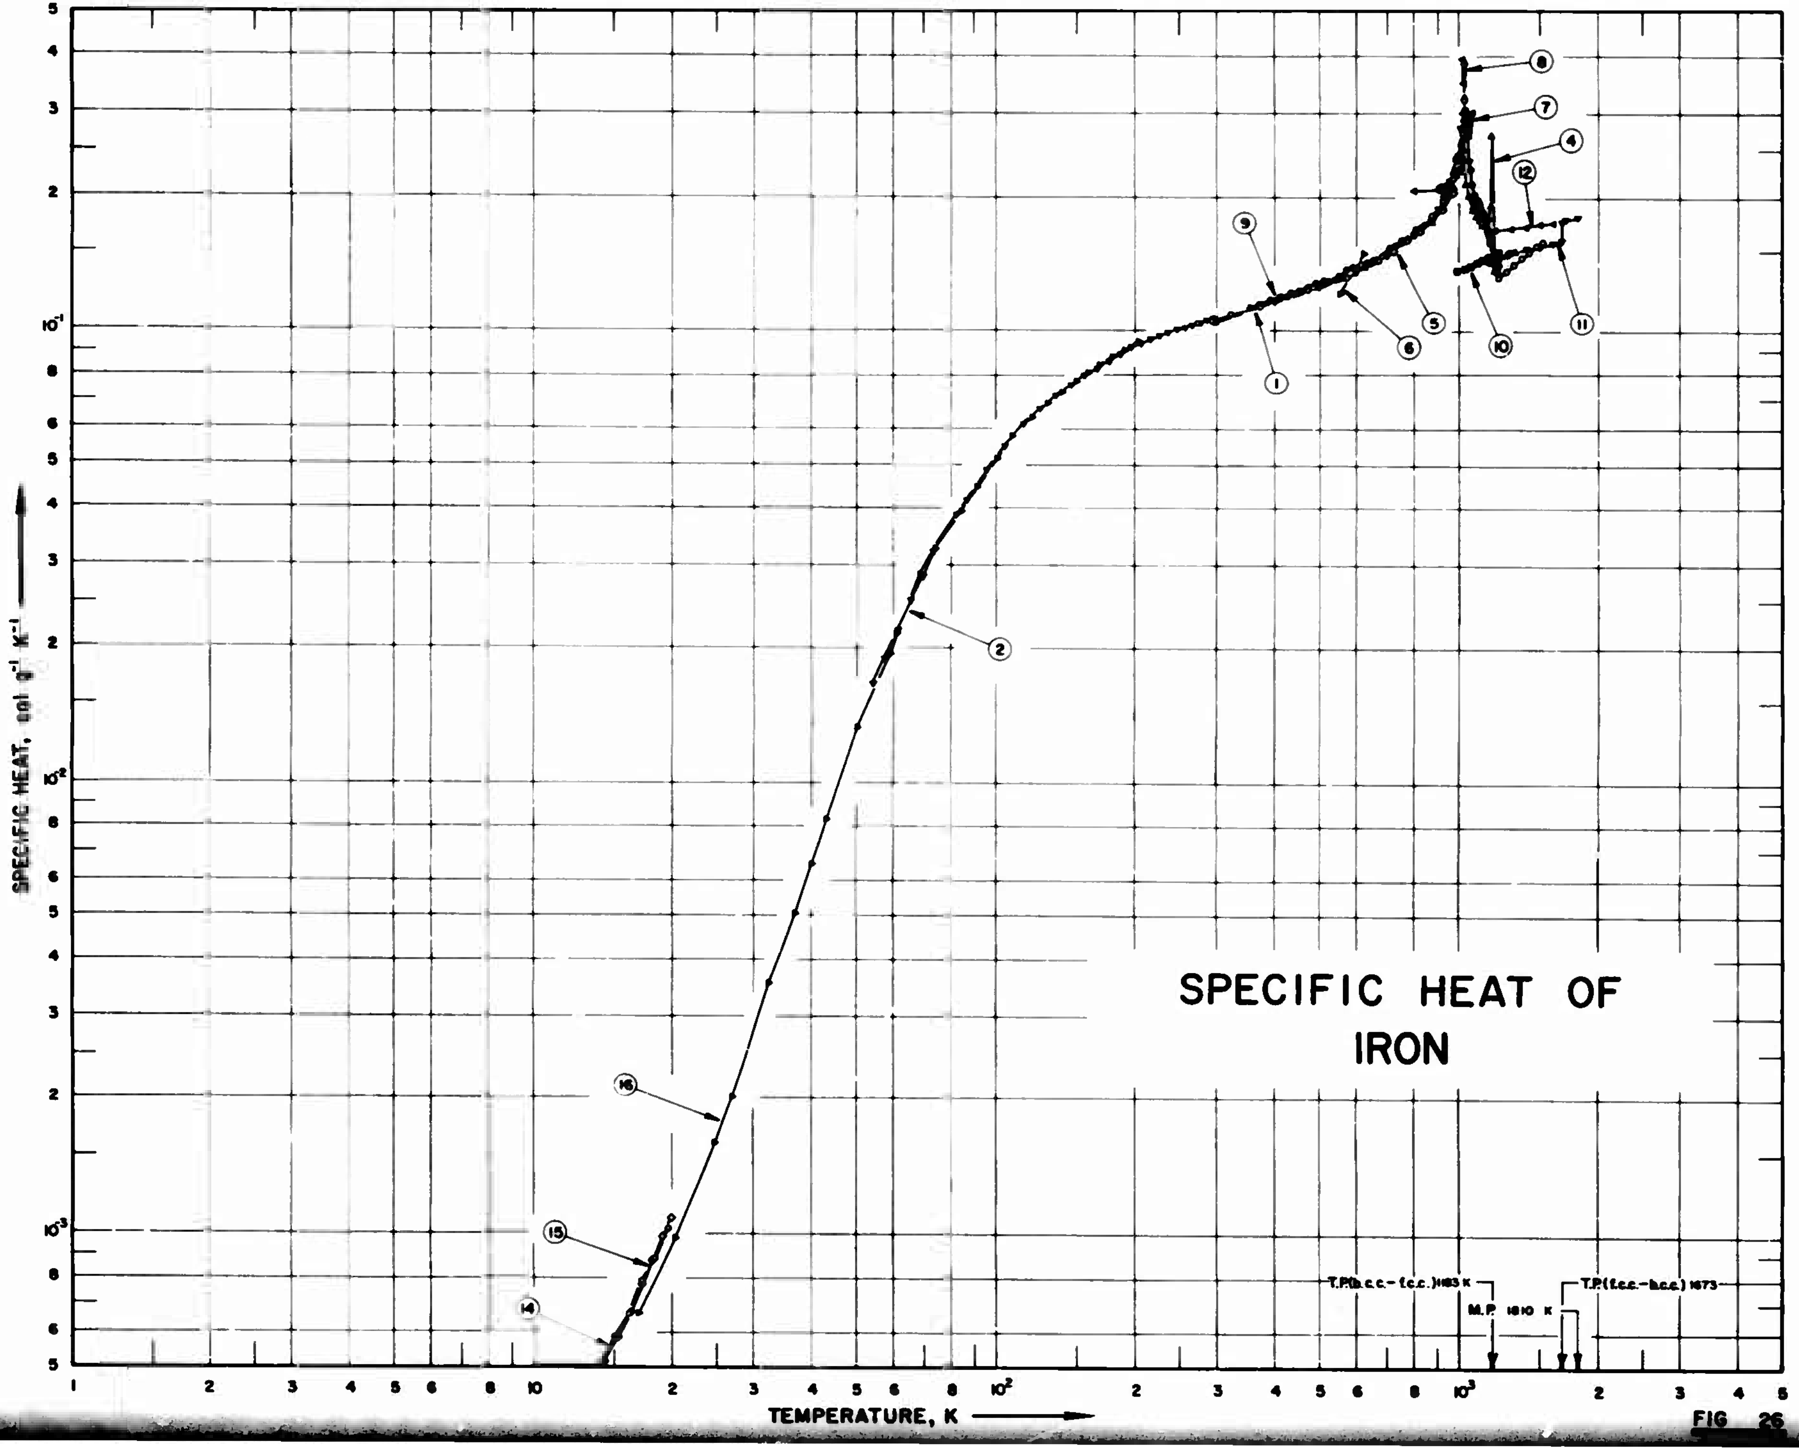
FIGURE SHOWS ONLY 14 OF THE CURVES REPORTED IN TABLE



SPECIFIC HEAT OF IRON

FIG 26

SPECIFICATION TABLE NO. 26 SPECIFIC HEAT OF IRON

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 26]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	26	1949	273-1523	± 2.0		99.99 Fe; annealed; density = 491.59 lb ft^{-3}.
2	27	1943	54-295	0.3		99.94 Fe, 0.031 N, <0.008 Si, <0.005 C, 0.004 Cu, <0.004 S, 0.003 Mn, 0.002 P, <0.001 O; annealed at 1190 C in dry hydrogen until O_2 content was below 0.001 %.
3	28	1963	1073-1673		α and γ iron	Impurities, 0.004 P, 0.004 Si (insol.), 0.003 Al (sol.), 0.0026 S, 0.002 Si (sol.), 0.001 C, 0.001 N_2, <0.001 Al (insol.), 0.0006 O_2, and 0.00001 H_2.
4	29	1940	373-1223			99.99 Fe.
5	30	1955	618-973	3.0-5.0	Armco iron	99.75 Fe, nominal composition.
6	17	1961	553, 623	<2.4		
7	31	1959	800-1071		Armco iron	99.75 Fe, nominal composition; measured in an argon atmosphere.
8	32	1960	298-1323	<2.0	High purity iron	Impurities 0.10 N_2, 0.03 C, 0.01 O_2, <0.0005 Ni, 0.0001 Cu, <0.0001 Ag, <0.0001 Mg, <0.0001 Na, and <0.0001 Si; sample supplied by the Johnson, Matthey and Co. Ltd; furnace under vacuum.
9	33	1957	353-1173	≤ 0.9	Electrolytic iron	Impurities, 0.016 C, 0.009 S, <0.005 Mn, <0.005 Si, <0.002 P, and traces of Al, Cu, and Ni.
10	33	1957	1013-1215	≤ 0.9	γ - iron	Same as above.
11	34	1962	298-1809		solid iron	99.945 Fe, 0.031 Ni, 0.008 Si, 0.005 C, 0.004 S, 0.004 other metals, 0.002 P, and 0.001 other non metals.
12	34	1962	1184-1665		α - iron	Same as above.
13	104	1946	348-1198	2.0		> 99.9 Fe.
14	82	1939	1.5-20			0.1 Mn, < 0.1 Ni, 0.04 Cu, 0.01 C, 0.005 Si, and 0.003 P; melted under vacuum.
15	82	1939	1.7-20			Same as above.
16	55	1930	17-206	1.5	Electrolytic iron	
17	83	1954	343-1208		Electrolytic iron	
18	28	1963	1198-1623		γ - iron	0.004 P, 0.004 Si (insol.), 0.003 Al (sol.), 0.0026 S, 0.002 Si (sol.), 0.001 C, 0.001 N, <0.001 Al (insol.), 0.0006 O, 0.00001 H.
19	104	1946	978-1193	2.0		> 99.9 Fe.
20	310	1963	20-1663		γ - iron	Pure iron.
21	310	1963	20-1663		α - iron	Pure iron.
22	311	1925	73-198			99.88 Fe, with small amounts of C, Si, Mn, and S.
23	312	1926	373-1523			100.0 Fe; specific heat corrected for carbon content.

SPECIFICATION TABLE NO. 26 (continued)

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
24	268	1926	373-1903			99.70 Fe, 0.110 Cu, 0.073 Mn, 0.042 Si, 0.040 C, 0.029 P, and 0.006 S.
25	289	1927	373-1273			Chemically pure specimen; vacuum melted.
26	313	1929	1123-1833		Electrolytic iron	
27	164	1932	273-1873			
28	314	1935	30-220			
29	315	1935	298.65			Annealed.
30	316	1938	378-1773		Electrolytic	Heated several times at 900 C to expel H_2 gas.
31	201	1939	1.2-20			Very pure sample, 0.01 Si; pressed and sintered in hydrogen at 1350 C for 9 hrs., sintered again above 1400 C for 16 hrs; density = 7.25 g cm^{-3}.
32	317	1945	1.5-20			0.1 Mn, 0.1 Ni, 0.04 Cu, 0.01 C, 0.005 Si, and 0.003 P.
33	318	1954	1181-1193			99.99 Fe; annealed.
34	319	1958	293-1030			
35	320	1959	1.8-5.3			Pure iron.
36	1	1961	295	± 5		Specimen probably in pure state.
37	318	1954	1175-1196			99.99 Fe; annealed.
38	318	1954	1174-1193			Same as above.

FIG 29

SPECIFICATION TABLE NO. 29 SPECIFIC HEAT OF LITHIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 29]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	50	1960	22-165	≤ 2.0		99.95 Li, 0.02 N, 0.01 Ca, 0.01 K, 0.005 Na, and 0.001 Fe; cooled to 4 K.
2	50	1960	22-165	≤ 2.0		Same as above; cooled to 20 K.
3	50	1960	95-135	< 2.0		Same as above; not annealed
4	50	1960	60-165	≤ 2.0		Same as above; annealed at 300 K.
5	50	1960	90-300	≤ 2.0		Same as above; cooled to 85 K.
6	50	1960	22-160	≤ 2.0		Same as above; cooled to 20 K.
7	50	1960	90-300	< 2.0		Same as above; cooled to 85 K.
8	51	1959	21-170	≤ 2.0		99.3 ^{6}Li, 0.70 ^{7}Li; cooled to 20 K.
9	51	1959	90-170	≤ 2.0		Same as above; cooled to 85 K.
10	51	1959	180-300	≤ 2.0		99.3 ^{6}Li, 0.70 ^{7}Li.
11	314	1935	15-300			
12	325	1950	459-773	± 10		
13	326	1950	473-773	± 10		Impurities: 0.1 Ca, 0.1 Si, < 0.1 Hg, < 0.1 P, and < 0.01 each Al, B, Cr, Cu, Fe, K, Na, and Ni; specimen supplied by The Maywood Chemical Co.
14	327	1951	773-1273	1.0		
15	328	1955	298-1200	0.3-0.5		Impurities: sample 1, 0.028 O_2, 0.003 N_2, 0.0036 Fe, 0.0006 Ni, 0.029 Ca, and 0.016 Na, sample 2, 0.003 Na, 0.001 Ca, 0.0006 Fe and 0.0003 Ni.

FIGURE SHOWS ONLY 11 OF THE CURVES REPORTED IN TABLE

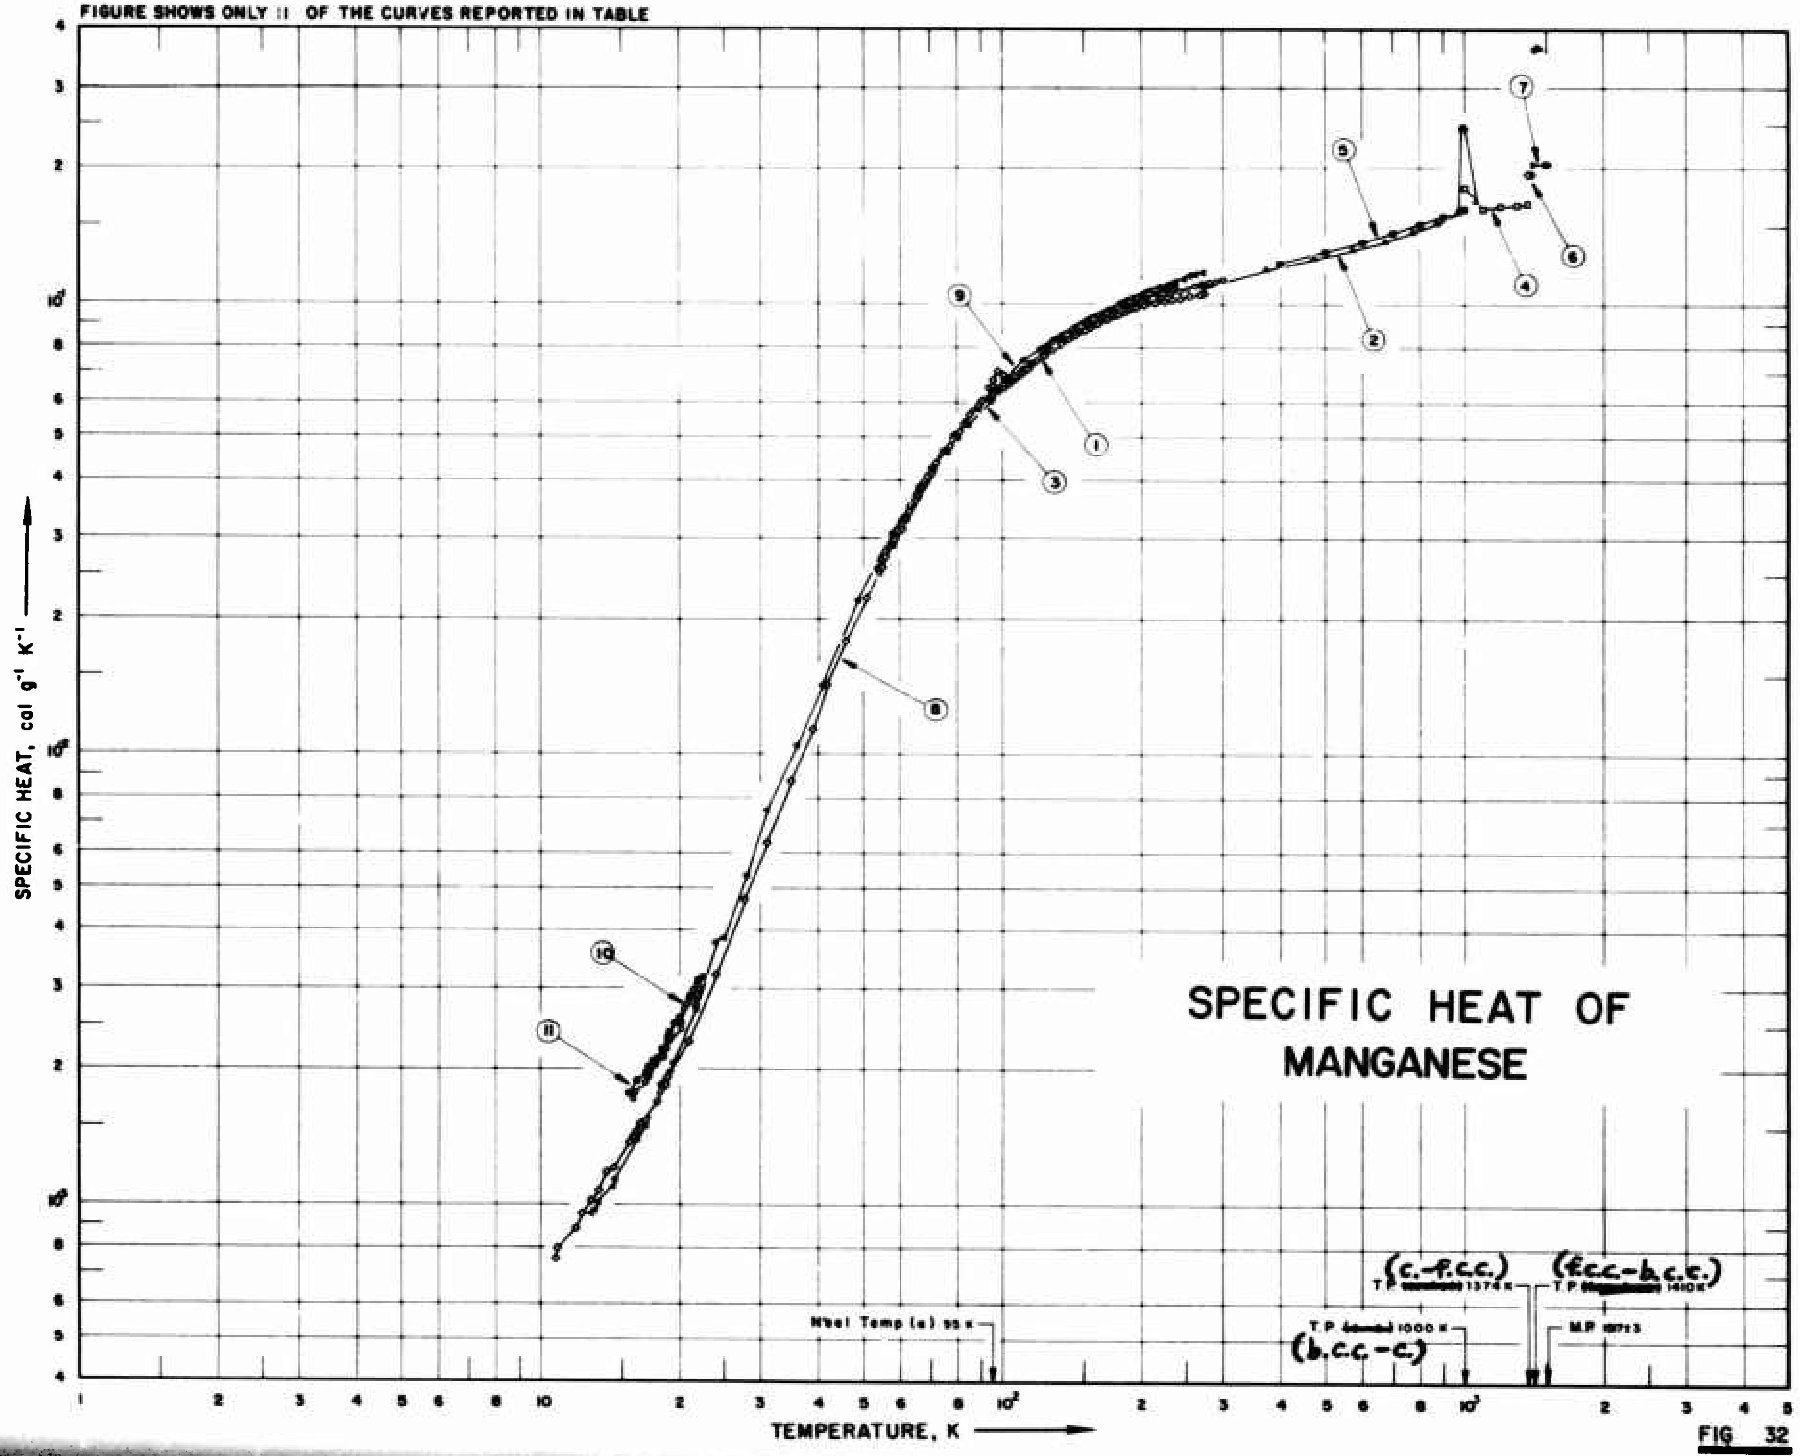

FIG 32

SPECIFICATION TABLE NO. 32 SPECIFIC HEAT OF MANGANESE

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No 32]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	330	1945	54-301		α - manganese	99.9 Mn; prepared by heating gradually to 550 C in 10^{-4} mm Hg vacuum.
2	24	1950	273-1073		Electrolytic	< 0.01 impurities, mainly Mg.
3	330	1945	54-237		γ - manganese	99.9 Mn; prepared by electrolysis of manganous sulfate in the presence of sulfites
4	57	1946	1000-1374		β - manganese	99.95 Mn, 0.03 - 0.07 Si samples in capsule of silica glass.
5	57	1946	298-1000		α - manganese	Same as above.
6	57	1946	1374-1410		γ - manganese	Same as above.
7	57	1946	1410-1517		δ - manganese	Same as above.
8	58	1964	11-273		α - manganese	99.95, 0.01 each C, Cu, and Fe; 0.001-0.01 O, 0.001 Si, 0 001 N and 2.00 H_2 per 199 g; density = 464 lb ft^3
9	58	1964	13-273		γ - manganese	Same as above; γ- manganese stabilized by adding 0.06 Cu.
10	59	1940	16-22		Powdered manganese	
11	60	1949	16-18		Powdered manganese	
12	221	1939	54-290			98.94 Mn, 1.06 Mn O_2, 0.24 O_2;(corrected for impurities).
13	331	1945	300-1450		Electrolytic	99.9 Mn; sample A, degassed by heating to 850 C under 10^{-5} mm vacuum and cooled slowly.
14	332	1955	12-20		β - manganese	Traces of Mg, and Ca; standardized Mn from Johnson Matthey and Co., Ltd. Lab. No 4135; annealed at 1120 C for 16 hrs under argon atmosphere followed by rapid quenching.
15	332	1955	12-20		α - manganese	Same composition as above; obtained from β - Mn by heating to 1100 C followed by slow cooling to room temperature and afterwards held at 600 C for 3 hrs followed by slow cooling to room temperature
16	223	1959	0.64-3.1	5.0		> 99.9 Mn; α - phase body centered cubic crystal structures; sample supplied by the Bureau of Mines, Battlesville, Oklahoma.

FIG 33

SPECIFICATION TABLE NO. 33 SPECIFIC HEAT OF MERCURY

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 33]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	333	1922	19-282			Vacuum distilled.
2	334	1923	3-92			
3	214	1927	314-416	1.0		Electrolytically purified; twice distilled under low pressure of current air.
4	335	1930	198-285	1.0	P sample	Trace of Sn; purified.
5	336	1948	4-90			Very pure.
6	284	1956	1-20			99.999 Hg; sample supplied from Johnson, Matthey and Co.
7	337	1951	234-773			< 0.01 each Cu and Ni, and 0.00001 non volatile impurity, mostly silver; sample was distilled 3 times.
8	338	1953	15-318	0.1-3.0		0.0006 max. total impurity; specimen from Mallinckrodt.
9	423	1911	61-243

FIG 34

SPECIFICATION TABLE NO. 34 SPECIFIC HEAT OF MOLYBDENUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 34]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	17	1960	300-2800	1.7		
2	61	1961	1100-2200	5.0		99.98 Mo, and 0.02 MoO; sample supplied by Moscow Hard Alloys Plant.
3	62	1962	973-2673	± 1.2		Polished surface; under vacuum and argon atmosphere.
4	63	1961	200-350			
5	64	1963	1200-2100	≤ 3.0	wire sample	99.93 Mo, 0.01 each C and Fe, 0.005 O_2, 0.001 H_2, 0.001 N_2, and 0.02 distilled residue; sample supplied by Metallwerk Plansee, Reutte Austria; outgassed and mounted in evacuated (1 x 10^{-6} mm Hg) glass envelope.
6	10	1958	478-1866			Sample supplied by the Climax Molybdenum Co.; measured under an atmosphere of 95% argon and 5% hydrogen; density = 640 lb ft^{-3} at 75 F.
7	65	1961	200-2860	4.0		
8	66	1951	473-1273			
9	67	1960	1550-2180	± 10.0		
10	68	1962	273-2673			
11	69	1959	13-271			99.9896 Mo, 0.004-0.006 Fe, 0.002 O, 0.002 Si, 0.0001 H, and 0.0001-0.0003 Co, Cu, Mg, Ni, and W; sample rods formed by powder metallurgy.
12	70	1934	273-1873			Pure; heated at 1400 C for 4, 8, and 12 hrs.
13	71	1960	1089-1700		Mo-9-8	99.90 Mo, <0.005 Fe, and < 0.003 C.
14	71	1960	1089-1700		Mo-11-5	Same as above.
15	71	1960	1089-1700		Mo-11-10	Same as above
16	72	1965	1250-1600	0.09		99.9 Mo; sample supplied by the Fansteel Metallurgical Corp.; annealed at 1425 K.
17	101	1958	400-946			Specimen's surface plated with platinum black.
18	213	1926	16-275			
19	339	1929	233-523	2.4		
20	340	1952	298-2650			99.9 Mo; sample supplied by the Fansteel Metallurgical Corp.
21	175	1953	1-10			Same as above.
22	341	1964	0.4-4		Mo-1	Very pure molybdenum single crystals; zone-refined; normal state.
23	341	1964	0.4-4		Mo-2	Ultra pure molybdenum single crystals; zone refined; normal state.
24	341	1964	0.4-0.9		Mo-2	Ultra pure molybdenum single crystals; zone refined; superconducting state.
25	341	1964	0.4-0.9		Mo-1	Ultra pure molybdenum single crystals; zone refined; superconducting state.

SPECIFIC HEAT OF NEODYMIUM

FIG 35

FIGURE SHOWS ONLY 2 OF THE CURVES REPORTED IN TABLE

SPECIFICATION TABLE NO. 35 SPECIFIC HEAT OF NEODYMIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 35]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	35	1951	2-160			0.052 Fe, 0.025 Mg, and <0.05 rare earth metals.
2	73	1960	298-1373	0.14		>99.78 Nd, 0.1 Ca, ≤0.04 Pr, ≤0.03 Sm, ≤0.02 Si, ≤0.02 Ta, and <0.01 Fe.
3	87	1964	0.4-4	<1.5	Expt. I	0.13 O_2, 0.12 Ta, 0.07 N_2, 0.065 Fe, 0.05 Na, 0.025 C, 0.015 Al, 0.0045 B, 0.0045 Ba, 0.004 F, 0.002 Gd, 0.002 K, 0.0015 Ni, 0.0015 Y, 0.0012 H_2, and traces (total 0.0028) Cu, Cr, Er, La, Li, Lu, Mg, Sc, Sr, and Zn; vacuum distilled; remelted in vacuum and cast into tantalum crucible; machined in argon atmosphere.
4	87	1964	0.4-4	<1.5	Expt. II	Same as above.
5	321	1936	373-973			99.5 Nd, traces of Fe, Si, and Al.
6	285	1958	273-1373			Impurities: 0.2 Ta, 0.1 Ca, 0.04 Pr, 0.03 Sm, 0.02 Si, and 0.01 Fe.

SPECIFIC HEAT OF NICKEL

FIG 37

SPECIFICATION TABLE NO. 37 SPECIFIC HEAT OF NICKEL

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 37]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	52	1936	325-922			0.10 Fe, 0.07 Mg, 0.003 S, Si, and trace Mn; aged for 3 hrs at 680 C and cooled slowly.
2	53	1955	770-1437	1.0		99.97 Ni, 0.0008 As, 0.0006 Fe, <0.0004 Si, <0.0003 Cr, <0.0003 Cu, 0.0001 Mn, remelted several times; heated several times to 1100 C and cooled slowly.
3	53	1955	423-1423	1.0		Same as above.
4	1	1961	295	± 5.0		
5	20	1959	800-1500	± 0.3		Sealed in argon.
6	18	1956	323-883	± 0.5	Electrolytic nickel	99.95 Ni, <0.05 Co, and the rest Al, Cu, Fe and Si.
7	38	1961	466-1584			
8	54	1954	673-1123			99.9 Ni.
9	55	1930	18-189	1.5	Electrolytic nickel	Cold deformed; recrystallized for 10 hrs. at 1000 C under nitrogen atmosphere.
10	56	1952	13-303			0.014 C, 0.0018 Co, 0.0009 Cu, and very slight trace Al, B, Ca, and Fe; annealed for 2 hrs at 900 C in H_2; heated for 5 hrs. at 1000-1100 C in 2 x 10^{-5} mm Hg and 5 hrs. in 8 x 10^{-6} mm Hg vacuum; cooled in vacuum to 800 C in 1 hr. and then to 100 C in 17 hrs.
11	101	1958	337-1164			Specimen's surface plated with platinum black.
12	55	1930	15-204	1.5	Electrolytic nickel	Cold deformed; recrystallized for 10 hrs. at 1000 C under nitrogen atmosphere.
13	268	1926	373-1903			99.920 Ni, 0.06 Fe, 0.013 Cu, and 0.007 Si.
14	342	1928	98-735			Pure.
15	164	1932	273-873			
16	343	1934	86-726	≤ 2.0		0.03 impurities.
17	315	1935	297.9		Electrolytic nickel	Forged annealed.
18	344	1935	1-19			99.81 Ni, 0.083 Fe, 0.04 C, 0.037 Mg, and 0.017 Cu.
19	345	1936	10-26			
20	182	1936	203-383	0.1		99.69 Ni, 0.13 Fe, 0.10 Si, 0.03 Cu, and 0.03 C.
21	183	1936	373-773	0.2-1.0		Same as above.
22	346	1936	373-1273			Pure.
23	347	1938	333-873	≤ 2.0	Sample II	0.031 Fe, 0.025 C, 0.007 Cu, 0.0004 S and negligible amount of Co; Mond pellets; melted under vacuum of $< 10^{-3}$ mm Hg and hammered into suitable shape.
24	347	1938	333-873	≤ 2.0	Sample III	0.04 Fe, trace of C and O_2, and negligible amount of Co; pressed powder; prepared by sintering a block of pressed powder in vacuo at 900 C; cooled at rate of one degree C per minute to room temperature.

SPECIFICATION TABLE NO. 37 (continued)

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
25	347	1938	333-410	≤ 2.0	Sample IV	Cathode nickel.
26	177	1938	291-813			99.91 Ni.
27	348	1939	813-1280			99.51 Ni.
28	293	1941	82-273			Impurities: 0.02 Fe, 0.01 C, 0.002 Si, 0.001 P, 0.001 Mn, and 0.0003 S.
29	319	1958	293-643			
30	349	1962	2-4	≤ 2.0		99.979 Ni, 0.01 Cu, 0.01 Fe, and 0.001 S.
31	350	1962	309-670		Mond nickel	99.85 Ni, 0.14 Fe, and trace of Co.

SPECIFIC HEAT OF NIOBIUM

FIG 38

SPECIFICATION TABLE NO. 38 SPECIFIC HEAT OF NIOBIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 38]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	74	1958	2-11	< 5.4	Nb-1, Run I	99.8 Nb, major impurity Ta; annealed; strain free, superconducting state; zero magnetic field.
2	75	1958	454-1882	≤ 2.9		Sealed in helium.
3	70	1934	273-1873			
4	64	1963	1400-2350	≤ 4.0	Wire sample	99.8 Nb, 0.08 Ta, 0.05 N_2, 0.05 O_2, 0.02 C, 0.02 Fe, 0.02 Ta, 0.02 Zr, 0.01 Ni, and 0.01 W; sample supplied by the Fansteel Metallurgical Corp.; outgassed and sealed in $< 1 \times 10^{-6}$ mm Hg glass envelope.
5	76	1960	11-271			97.708 Nb, 0.122 Ta, 0.08 O_2, 0.03 Si, 0.023 Ti, 0.02 Ni, 0.01 C, and 0.007 Fe.
6	125	1965	1273-2593	± 1.26		99.83 Nb; powder metallurgy product of 20-mil sheet.
7	74	1958	9-29	< 5.4	Nb-1, Run II	99.8 Nb, major impurity Ta; annealed; strain free; superconducting state; zero magnetic field.
8	74	1958	5-11	< 5.4	Nb-1, Run III	99.8 Nb, major impurity Ta; annealed; strain free; normal state; 2640 gauss magnetic field.
9	74	1958	5-11	< 5.4	Nb-1, Run IV	99.8 Nb, major impurity Ta; annealed; strain free; normal state; 3000 gauss magnetic field.
10	74	1958	1.4-11	< 5.4	Nb-II, Run I	99.8 Nb, major impurity Ta; annealed, strain free; superconducting; zero magnetic field.
11	74	1958	1.3-9	< 5.4	Nb-II, Run II	99.8 Nb, major impurity Ta; annealed; strain free; normal state; 4130 gauss magnetic field.
12	351	1953	2.6-10.5			99.8 Nb; annealed; strain free; superconducting; zero magnetic field.
13	352	1964	0.5-9			< 0.075 Ta, 0.0075 Si, 0.0054 N_2, 0.0034 O_2, and 0.0025 Fe; single crystal.
14	351	1953	3.2-8.6			99.8 Nb; annealed; strain free; normal state.

SPECIFIC HEAT OF PLATINUM

FIG 41

SPECIFICATION TABLE NO. 41 SPECIFIC HEAT OF PLATINUM

(Impurity $< 0.20\%$ each; total impurities $< 0.50\%$)

[For Data Reported in Figure and Table No. 41]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	99	1939	273-1873			
2	100	1955	338-727			Thermocouple grade; tested at pressure of 5 x 10^{-4} mm Hg.
3	101	1958	337-1164			Specimen's surface plated with platinum black.
4	167	1936	1.1-20			99.95 Pt.
5	168	1957	11-274			99.94 Pt, 0.03 Rh, 0.01 Pd, trace of Ag, Ca, Cu, Fe, and Mg.
6	169	1962	298-2043	0.3		99.99 Pt; measured in argon atmosphere.
7	213	1926	18-208			
8	261	1933	473-1373

SPECIFIC HEAT OF POTASSIUM

CONTINUED FROM FIGURE 43-1

FIG. 43-2

SPECIFICATION TABLE NO. 43 SPECIFIC HEAT OF POTASSIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 43]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	170	1918	69-287	< 1		Kahlbaum's purity; melted under vacuum.
2	171	1939	203-609			Kahlbaum's purest potassium; distilled.
3	259	1957	11-323	0.1		Spectroscopic traces of Al. B and Si, triple distilled under high vacuum.
4	173	1957	1.5-2.0			99.995 K
5	174	1963	273-1423			0.0035-0.004 O_2; under argon atmosphere.
6	213	1926	15-277			
7	214	1927	363-454	1.0		Melted in vacuum and filtered into distillation bulbs.
8	176	1955	30-330			< 0.01 Na; specimen from Pure Metal Research Committee of the United Kingdom and prepared by Imperial Chemical Industry.
9	172	1954	11-322	0.15-0.5		99.96 ± 0.02 K. 0.01-0.1 Rb. 0.003-0.3 Ca. 0.001-0.1 each Cr. Fe, and Na, and 0.0003-0.002 Cu; 99+ K sample supplied by the Mine Safety Appliance Co.; triple distilled.
10	353	1952	273-1073	2.0		Impurities: 0.01-0.1 Na. 0.001-0.01 Ca, and < 0.001 each Al. Cr. Fe. Mg. Rb, Mn, and Si; sample supplied by Baker Chemical Co.; prepared by triple distillation.
11	356	1964	0.3-4	0.3-1.5		99.99 K (stated purity). 0.2 Na (analyzed); measured under argon atmosphere.

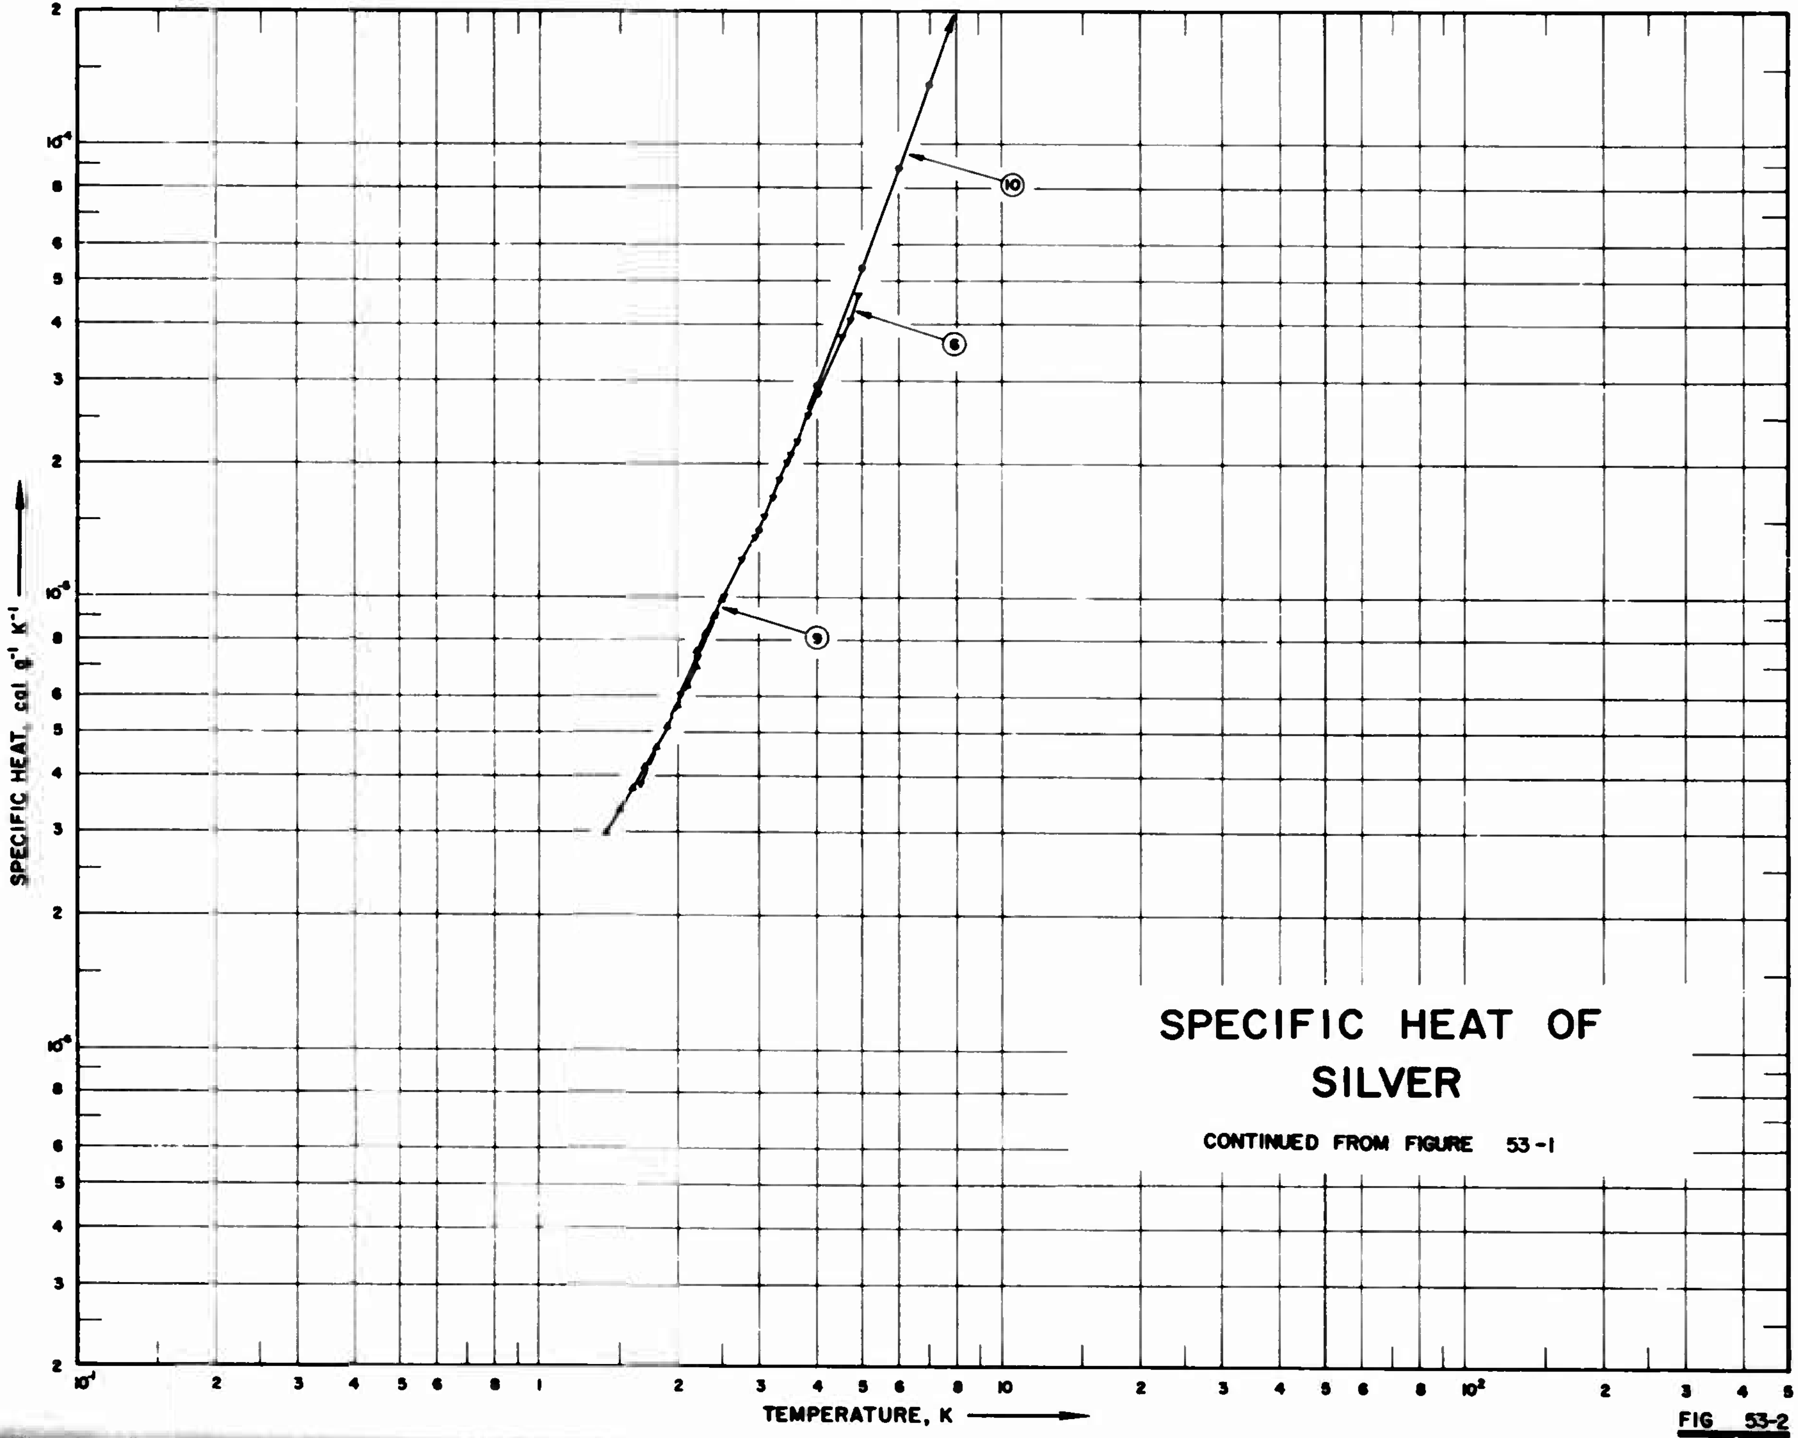
SPECIFIC HEAT OF SILVER

FIG 53-1

FIGURE SHOWS ONLY 8 OF THE CURVES REPORTED IN TABLE



SPECIFIC HEAT OF SILVER

CONTINUED FROM FIGURE 53-1

FIG 53-2

SPECIFICATION TABLE NO. 53 SPECIFIC HEAT OF SILVER

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 53]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	101	1958	337-1090			Specimen's surface plated with platinum black.
2	52	1936	325-925			Inquartation silver; heated under reduced pressure in argon.
3	103	1941	15-298			99.99 Ag; melted and crystallized in nitrogen and cooled over a period of 5 days.
4	179	1924	373-1173	< 1.0		Melting sample.
5	180	1932	273-1073	≤ 0.2		Pure oxygen free silver.
6	181	1934	2-5			
7	182	1936	193-393	± .03		99.98^{+} Ag, 0.0095 Cu, and 0.0018 Fe.
8	183	1936	373-773	≤ 1.0		Same as above.
9	178	1952	1.4-2.5			99.999 Ag; single crystal.
10	184	1966	3-30	≤ ± 5.0		99.999 Ag, 0.0005 - 0.00005 Fe, < 0.00005 each, Ca and Mg, < 0.00002 Cu, and 0.0001 - 0.00001 Si; large crystals; cast by Consolidated Mining, Smelting and Refining Co., Ltd.; annealed condition.
11	268	1926	373-1573			Electrolytic silver.
12	360	1932	1-20			99.95 Ag; sample supplied by Zilverfabriek.
13	296	1955	1-5	0.5		99.98 Ag, 0.01 Cu, and 0.01 total, Fe, Pb, Mg, and Mn; sample supplied by Handy and Harman Co.; annealed under vacuum of 1×10^{-6} mm Hg for 4 hrs. at 700 C; cooled under vacuum at rate of 200 C per hr.

SPECIFICATION TABLE NO. 54 SPECIFIC HEAT OF SODIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 54]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	113	1960	21-80	≤ 2.0		High purity; sealed in helium; cooled to 2 K.
2	113	1960	21-60	≤ 2.0		Same as above; cooled to 20 K.
3	113	1960	21-80	≤ 2.0		Same as above; cooled to 20 K; annealed at 300 K.
4	113	1960	40-65	≤ 2.0		Same as above; cooled to 35 K.
5	113	1960	40-300	≤ 2.0		Same as above; cooled to 36 K.
6	7	1959	373-673	≤ 2.0		99.99 Na; technical grade.
7	170	1918	65-294	< 1.0		Kahlbaum's purity; melted under vacuum.
8	185	1950	273-1173	1.0		0.001 - 0.01 K, and 0.0001 - 0.001 each Ca, and Li; under helium atm.
9	173	1957	1.5-20			99.995 Na.
10	267	1920	87-124			Kahlbaum's purity.
11	213	1926	17-118			Kahlbaum's purity.
12	214	1927	394-451	1.0		Commercial electrolytic metal; purified by melting in vacuum and filtering through capillary tubing.
13	336	1948	2-25			Pure metal, hydrogen free.
14	361	1954	55-320	± 0.1		
15	362	1955	1.5-20			Redistilled Na of very high purity; self annealed for several days at room temperature.
16	223	1959	0.4-2	5.0		> 99.99 Na; under pure argon atm; annealed.

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	17	1960	100-3200			
2	65	1961	100-3195	4.0		
3	64	1963	1200-2400	≤ 2.5	Wire	99.90 Ta, 0.05 Nb, 0.02 W, 0.015 C, 0.015 O_2, 0.01 each Fe, Mo, Si, Ti, and Zr, and 0.005 N_2; sample supplied by the Fansteel Metallurgical Corp.; outgassed and sealed in < 1 x 10^{-6} mm Hg glass envelope.
4	363	1957	12-539			99.9* Ta, 0.04 Nb, 0.013 Fe, 0.01 W, < 0.01 each C, Si, and < 0.005 Mo; sample supplied by the Fansteel Metallurgical Corp.; annealed.
5	115	1962	1200-1700	< 10		99.9 Ta; sealed in vacuum; degassed for 2 hrs. at 2150 C.
6	116	1961	1273-2939	1.0		Sealed under vacuum of 2 x 10^{-6} mm Hg.
7	117	1963	1200-2900	1.0		> 99.854 Ta, 0.05 Nb, < 0.02 each Ti, W, 0.014 O_2, 0.005 C, 0.004 Fe, and 0.003 Mo.
8	71	1960	1089-1700		Tan 9-4	
9	71	1960	1089-1700		Tan 10-22	Same as above.
10	71	1960	1089-1700		Tan 10-29	Same as above.
11	201	1929	573-1173			Sample supplied by the Fansteel Metallurgical Corp.; stabilized by heating 3 to 6 hrs. in vacuum at 1400 C and slowly cooling.
12	70	1934	273-1873	≤ 0.2		
13	204	1958	1.3-24			99.9 Ta; sample supplied by the Fansteel Metallurgical Corp.; annealed in vacuum of 1 x 10^{-5} to 1 x 10^{-6} mm Hg for 24 hrs. at 1800 - 2400 C; zero magnetic field, superconducting.
14	204	1958	1.4-5.4			Same as above; 1930 gauss external magnetic field.
15	204	1958	1.6-4.5			Same as above; 237 gauss external magnetic field.
16	204	1958	1.3-3.2			Same as above; 454 gauss external magnetic field.
17	204	1958	1.5-2.3			Same as above; 557 gauss external magnetic field.
18	364	1940	53-295		Sample A	Pure wrought Ta; sheared in lengths of 0.5 cm; washed consecutively with HCL solution, NaOH, distilled water and alcohol; dried near 100 C.
19	364	1940	80-295		Sample B	0.067:1 ratio of hydrogen to tantalum; made from sample A by heating to 710 C in vacuum (10^{-5} mm Hg at room temperature to 2 x 10^{-4} at 710 C) and then admitting hydrogen.
20	364	1940	80-295		Sample C	0.0958:1 ratio of hydrogen to tantalum; made from sample B by evacuating to 10^{-5} mm Hg at room temperature; heating to 700 C, and admitting additional hydrogen.

SPECIFICATION TABLE NO. 56 (continued)

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
21	364	1940	80-295		Sample D	Prepared by pumping hydrogen from sample C at 720 C, pumping continued until pressure had fallen to 2 x 10^{-4} mm Hg at 720 C and during cooling to room temp.
22	364	1940	80-295		Sample E	0.0284:1ratio of hydrogen to tantalum; prepared by dehydrogenating sample D at 700 C.
23	364	1940	53-320		Sample E	99.85 Ta, 0.11 C, 0.037 H_2, and 0.005 Fe.
24	365	1941	1.4-4.3			>99.95 Ta, and traces of Cu, Fe, Nb and Si; sample supplied by Nederlandsche Siemens N.V.
25	366	1965	10-274

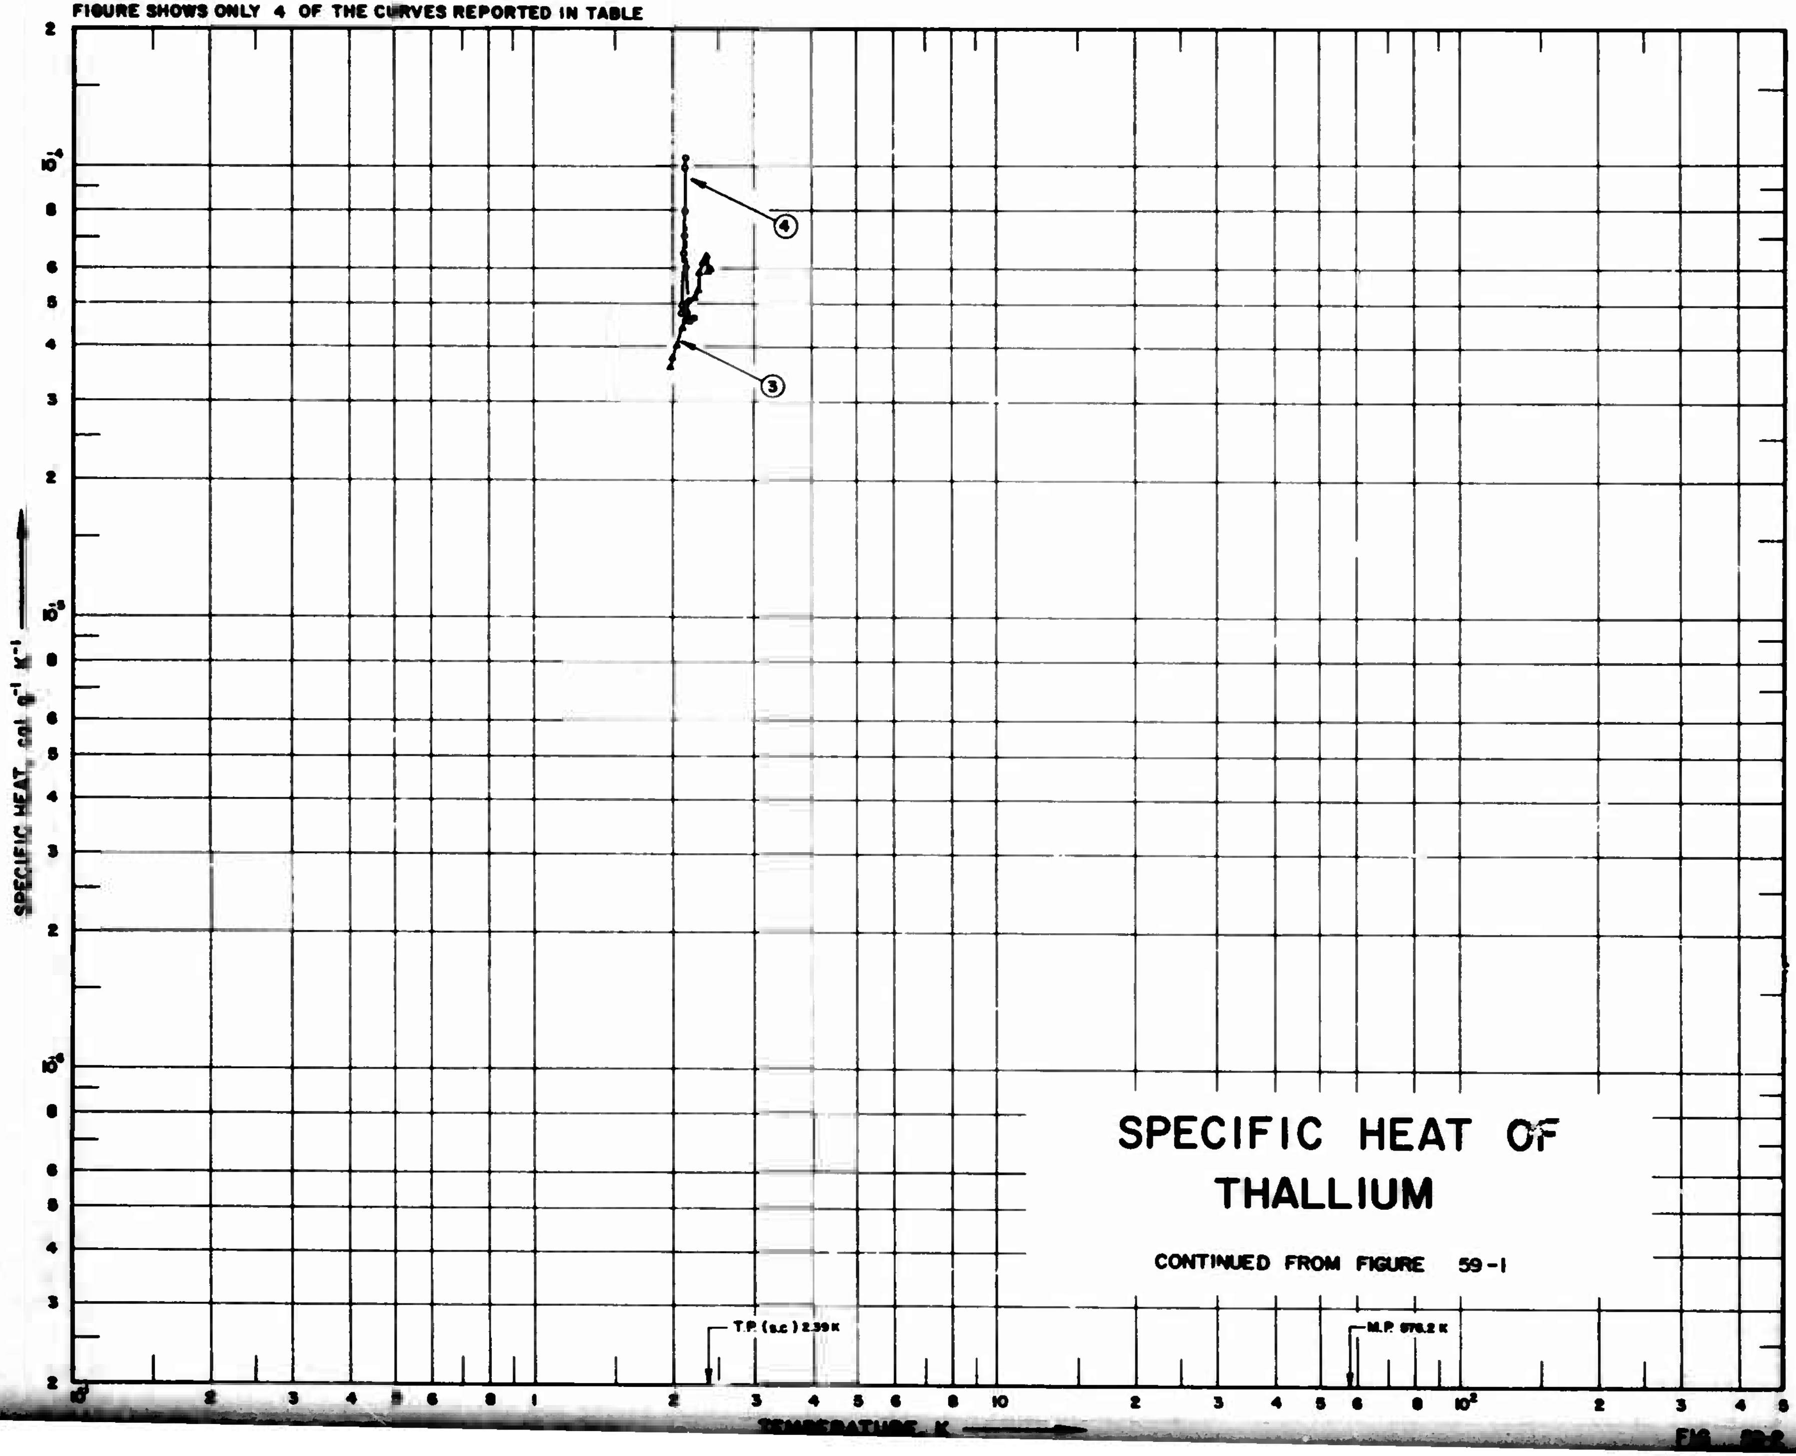
SPECIFIC HEAT OF THALLIUM

FIG 59-1

FIGURE SHOWS ONLY 4 OF THE CURVES REPORTED IN TABLE



SPECIFIC HEAT OF THALLIUM

CONTINUED FROM FIGURE 59-1

FIG. 59-2

SPECIFICATION TABLE NO. 59 SPECIFIC HEAT OF THALLIUM

(Impurity $< 0.20\%$ each; total impurities $< 0.50\%$)

[For Data Reported in Figure and Table No. 59]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	186	1930	11-249			Traces of Al and Fe.
2	187	1931	291-773	± 3.0		
3	188	1934	1.9-2.4			Zero magnetic field.
4	188	1934	2.0-2.2			33.6 gauss magnetic field.
5	368	1938	15-301	≤ 5.0		~99.98 Tl; sample supplied by the American Smelting and Refining Co.; density = 11.878 g cm^{-3} at 20.7 C.
6	369	1934	1.3-4.1			
7	370	1957	2.4-4.1			99.999 Tl; sample supplied by the A.D. Mackay, Inc.; zero magnetic field; superconducting.
8	370	1957	1.2-4.1			Same as above; 200 oersteds; normal state.
9	370	1957	1.1-2.3			Same as above; superconducting; zero magnetic field.

SPECIFICATION TABLE NO. 62 SPECIFIC HEAT OF TIN

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 62

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	85	1965	0.1-1.0	1.0		99.9999 Sn; polycrystalline; sample supplied by Cominco Products Inc.; zero magnetic field; vacuum cast.
2	85	1965	0.1-1.1	1.0		99.9999 Sn; polycrystalline; sample supplied by Cominco Products Inc.; H = 1000 Oe, magnetic field; vacuum cast.
3	189	1923	70-101	1.0		Good quality.
4	190	1924	22-286		White tin	
5	190	1924	16-284		Grey tin	
6	191	1932	1-20			Kahlbum's purity; 0.01 Fe and trace Cu.
7	192	1932	273-505		White tin	Purest tin; sample supplied by E. Merck.
8	193	1947	323-623			Tin, heating.
9	193	1947	323-523			Tin, cooling.
10	43	1952	7-100	1.0	Grey tin	< 0.05 total impurity, coarse powder; under 10^{-5} mm Hg helium atm.
11	194	1955	1.5-4.0		Grey tin	99.8 Sn; powdered form.
12	195	1956	1-4	1.3		99.999^{+} Sn; zero magnetic field; superconducting; 4.2 K the residual resistivity is 0.002 at room temperature.
13	196	1958	506-800			99.9 Sn, 0.05 Pb, 0.02 Cu, 0.01 Bi, 0.005 Sb, 0.002 Ni, 0.001 Ca, 0.001 In, 0.0005 Cd, and 0.0005 Ag; sample supplied by the American Smelting and Refining Co.; molten state.
14	197	1961	0.6-1.6	1-2		99.990 ± 0.002 Sn; normal state; 500 gauss magnetic field.
15	197	1961	0.8-2	1-2		99.990 ± 0.002 Sn; superconducting; zero magnetic field.
16	198	1938	1.1-4			99.992 Sn, 0.01 Fe, and trace Cu; superconducting; zero magnetic field.
17	198	1938	1.5-4			Same as above; normal state; 299.0 gauss magnetic field.
18	195	1956	1.1-4			99.999^{+} Sn; 800 oersteds; normal state; 4.2 K the residual resistivity is 0.002 at room temperature.
19	198	1938	2.8-3.9			99.992 Sn, 0.01 Fe, and trace Cu; normal state; 138.6 gauss magnetic field.
20	371	1960	0.4-4.3		Tin I	99.999 Sn; sample supplied by the Consolidated Mining and Smelting Co. of Canada, Ltd.; self annealed at room temperature; superconducting; zero magnetic field.
21	371	1960	0.4-3.8		Tin I	Same as above; normal state; 500 oersteds.
22	371	1960	0.4-4.1		Tin II	99.999 Sn; sample supplied by the Consolidated Mining and Smelting Co. of Canada, Ltd.; annealed in air for one hr. at 200 C; superconducting; zero magnetic field.

SPECIFICATION TABLE NO. 62 (continued)

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
23	371	1960	0.6-4.2		Tin II	Same as above; normal state; 500 oersteds.
24	1	1961	295	± 5.0		
25	268	1926	348-873			99.989 Sn, 0.008 Cu, and 0.003 Pb.

SPECIFICATION TABLE NO. 63 SPECIFIC HEAT OF TITANIUM

(Impurity $< 0.20\%$ each; total impurities $< 0.50\%$)

[For Data Reported in Figure and Table No. 63]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	127	1959	298-1400	± 1.6		
2	160	1965	343-1103	± 5.0		0.0055 O_2, 0.002 other metals, 0.0015 C, 0.001 N_2, and 0.0008 H_2.
3	129	1963	599-1066	≤ 6.0	Filament No. 2	≤ 0.2 C, few tenths percent maximum O_2, N_2, and Fe; sample supplied by the Driver-Harris Co.; sealed under vacuum.
4	129	1963	758-1150	≤ 6.0	Filament No. 3	Same as above.
5	130	1958	868-1348	± 5.0		Commercial grade; sealed under vacuum.
6	81	1961	294-1923			99.705 Ti, 0.08 Fe, 0.07 Si, 0.05 C, 0.03 N_2, 0.02 O_2, 0.005 H_2, and 0.04 other impurities.
7	132	1944	54-295			98.75 Ti, 0.5 Si, 0.27 Fe, and 0.15 V; data corrected for impurities.
8	133	1956	422-978	± 18		99.9 Ti.
9	134	1957	323-1233		Iodide titanium	0.032 C, 0.03 Fe, 0.011 O_2, 0.0067 H_2, 0.001 Cu, and 0.00077 N_2; under 0.01 μ Hg vacuum.
10	134	1957	433-1223		Iodide titanium	Same as above.
11	134	1957	363-1113		Iodide titanium	Same as above.
12	134	1957	333-1033		Iodide titanium	Same as above.
13	135	1956	311-1033		Ti 75 A	99.75 Ti, 0.131 O_2, 0.07 Fe, 0.06 C, 0.048 N_2, and 0.0068 H_2.
14	136	1953	15-306			0.0082 Mn, 0.007 Si, 0.0066 Al, 0.02 total of Cu, Pb, N_2, and Te; prepared by iodide process; annealed under high vacuum at 800 C.
15	128	1956	6-16			≥ 99.95 Ti; annealed.
16	308	1957	1-21			~99.9 Ti; hexagonal close-packed structure.
17	200	1958	14-272			
18	199	1936	473-1090			Purest ductile titanium; prepared by the Van Arkel iodide process.
19	372	1956	4-15	< 2.0		99.95 - 99.99 Ti, sample supplied by the Foote Mineral Co.
20	340	1952	15-1900 ?	0.2		99.96 Ti, 0.0082 Mn, 0.007 Si, 0.0066 Al, Cu, Pb, N_2, and Te; sample supplied by the New Jersey Zinc Co.
21	203	1956	5-18	< 1.0		99.95 - 99.99 Ti, impurities total < .005 of Al, Ca, C, Cr, Cu, Fe, Mg, Mn, Ni, N_2, Si, and Sn; prepared by admitting hydrogen to tube of titanium; annealed at temperatures < 500 C with final anneal at 180 C; cooled slowly to room temperature.
22	340	1952	298-1900	0.2		99.96 Ti, 0.0082 Mn, 0.007 Si, 0.0066 Al, Cu, Pb, N_2 and Te; sample supplied by the New Jersey Zinc Co.

FIGURE SHOWS ONLY 14 OF THE CURVES REPORTED IN TABLE

SPECIFICATION TABLE NO. 64 SPECIFIC HEAT OF TUNGSTEN

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 64]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	12	1962	533-3033	≤5.0		99.9914 W, 0.003 Fe, 0.0026 Si, 0.002 O_2, 0.001 Cu, H_2, Ni, N_2, and P; sample supplied by Union Carbide Muetals Co.
2	64	1963	1200-2400	≤2.0	Wire sample	99.90 W, residuals WC; out gassed and sealed in $< 1 \times 10^{-6}$ mm Hg glass envelpe.
3	137	1962	2273-2673	≤1.2		99.95 W; powder metallurgy; sealed under 10^{-2} - 10^{-3} mm Hg at 1.05 atm.
4	67	1962	1550-2880	+ 10.2		
5	116	1961	1273-2893	1.0		99.8 W; degassed at 2150 C for 2 hrs; sealed under vacuum.
6	138	1962	2673-3093	≤0.5		99.95 W, 0.05 impurities; polished surface.
7	139	1962	273-2600	≤1.2		Same as above.
8	69	1959	12-273			99.9917 W, 0.002-0.006 Fe, 0.002 Si, and 0.0001-0.0003 Cu, Mg, Mo. and Ni; sample rods prepared by powder metallurgy.
9	71	1960	1089-1700			99.9 W, and < 0.02 R_2O_3.
10	140	1962	1500-2200	<4.0		Sealed under argon atmosphere.
11	90	1958	13-78	0.5	W-1	99.99 W, and traces of Ag, Cu, Fe, Mn, Ni, and Si.
12	90	1958	13-93	0.5	W-2	99.985 W, 0.01 Na_2O, and 0.005-0.008 Ni.
13	80	1963	600-3100	< 1.2		≤0.05 impurities; prepared by powdered metallurgy.
14	201	1929	373-1173			
15	164	1932	273-1873			
16	202	1950	1.5-2.9	± 0.5		99.9 W.
17	175	1953	2-20			99.9 W; sample supplied by Fansteel Metallurgical Corp; under helium atmosphere.
18	203	1957	4-15	2.0		99.9 W, and < 0.02 H_2O_3.

FIG 66

SPECIFICATION TABLE NO. 66 SPECIFIC HEAT OF VANADIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 66]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	146	1961	479-1894	3.0		99.74 V, 0.073 O_2, 0.048 Fe, 0.043 N, and 0.042 C; hot rolled; annealed; sealed under helium atm.; density = 378 lb ft^{-3}.
2	147	1962	298-1485	1.7		99.8 V, 0.1 C, 0.07 O_2, and 0.03 N_2.
3	148	1961	25-340			99.8 V, 0.05 Fe, 0.01 Hf, 0.01 Nb, 0.001 each Co, Cr, Mg, Ni, and Si, < 0.001 Mn, and 0.0001 Cu; carbothermic vanadium powder; annealed in vacuum for few hrs. at 800 K.
4	70	1934	273-1873	≤ 0.2		Purest vanadium; sample supplied by the Vanadium Corp. of America.
5	373	1936	54-297			≥ 99.5 V; sample supplied by the Vanadium Corp. of America; pellets of -8 to + 35 mesh; density = 6.009 g cm^{-3} at 22.5 C.
6	374	1954	1.2-5			Annealed in vacuo (pressure < 3 x 10^{-6} mm Hg) for 3 hrs. at 850 C and then cooled slowly at about 50 C per hr.

SPECIFIC HEAT OF YTTRIUM

FIG 68

SPECIFICATION TABLE NO. 68 SPECIFIC HEAT OF YTTRIUM

(Impurity $< 0.20\%$ each; total impurities $< 0.50\%$)

[For Data Reported in Figure and Table No. 68]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	158	1960	5-340	0.3		0.5 total of Ca, Cr, Dy, Gd, Mg, 0.44 Ta, 0.025 N_2 and 0.015 C; after heat capacity measurements, chemical analysis showed 0.97 YOF, and 0.44 Ta; data corrected for impurities.
2	36	1961	298-1950			98.7 Y; < 1.0 Ta, < 0.05 each Ca, Er, Ho, Yb, < 0.01 each Fe, Gd, Si, < 0.005 each Dy, Mg, 0.025 O_2, 0.007 N_2, 0.0077 C, and 0.1 F; obtained as crystals by distillation; pressed into 1/2 inch dia. rod; sealed under reduced pressure of helium in two concentric tantalum crucibles.

FIG 69-2

SPECIFICATION TABLE NO. 69 SPECIFIC HEAT OF ZINC

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 69]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	206	1924	278–498			
2	179	1924	373–673			Pure commercial product; negligible amounts of Cd, Fe, and Pb.
3	207	1928	21–202			Kahlbaum's purity.
4	191	1932	1–21			Kahlbaum's purity.
5	208	1935	373–673			Pure Zn; fused in hydrogen atmosphere.
6	182	1936	193–393			99.98Zn, 0.009 Pb, 0.004 Cd, 0.0014 Fe, and 0.001 Cu.
7	202	1950	1.5–4	± 0.5		99.9 Zn, and 0.1 Pb; powder specimen.
8	202	1950	1.5–3.4	± 0.5		Same as above; fused Zn.
9	208	1955	2–20			
10	210	1959	12–273	0.2–0.7		99.995 Zn.
11	211	1959	1.2–2.4	<3.0		99.95 Zn.
12	216	1958	0.4–4.2			99.999 Zn; sample supplied by the American Smelting and Refining Co.; superconducting; zero magnetic field; sample maintained at 340 C for 40 hrs. and then returned to room temperature in 60 hrs.
13	216	1958	0.7–3.9			99.999 Zn; sample supplied by the American Smelting and Refining Co.; normal state; sample maintained at 340 C for 40 hrs. and then returned to room temperature in 60 hrs.
14	282	1924	10–373			
15	268	1926	348–1073			99.948 Zn, 0.03 Fe, and 0.022 Si.
16	376	1956	12–320			0.0003 Fe, 0.0002 Pb, 0.00005 each Cd, Cu, Sn, and 0.000006 As; melted at 650 - 700 C for 1 hr.; cooled, flushed with helium and outgassed again at 700 C for 5 min. outgassed again under vacuum for 15 min. at 300 - 380 C; under helium melted again and then permitted to solidify; annealed under helium atm. for 24 hrs. at 65 C and then for 9 days at room temperature.
17	1	1961	295	± 5.0		
18	377	1962	1.8–4.1			Large single crystals.

SPECIFIC HEAT OF ZIRCONIUM

FIG 70

SPECIFICATION TABLE NO. 70 SPECIFIC HEAT OF ZIRCONIUM

(Impurity < 0.20% each; total impurities < 0.50%)

[For Data Reported in Figure and Table No. 70]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	128	1954	20-200	< 5.0		99.5 Zr.
2	146	1961	528-1863	3.0		99.95 Zr, 0.029 Fe, 0.017 C, 0.0045 Hf, and <0.031 all other elements; sealed under helium atmosphere; density = 405 lb ft^{-3}.
3	134	1957	323-1063		Zr - 300 ppm H alloy	99.966 Zr, and 0.03 H_2; homogenized 14 days at 1300 C; sealed under 0.01 μ Hg vacuum.
4	134	1957	363-883		Iodide zirconium	0.022 C, 0.015 O_2, 0.013 Fe, 0.0075 N_2, 0.007 Hf, 0.0004 K, 0.0035 H_2, 0.003 each Na, Ni, 0.0018 each Si, W, 0.0014 Cu, 0.0007 Cr, 0.0006 Ca, 0.0005 each Mg, Pb, 0.0004 each Al, Sn, 0.00035 Mo, 0.0002 Ti and 0.0001 Co; homogenized 14 days at 1300 C; sealed under 0.01 μ Hg vacuum.
5	134	1957	363-1223		Iodide zirconium	Same as above.
6	134	1957	543-863		Iodide zirconium	Same as above.
7	134	1957	333-743		Iodide zirconium	Same as above.
8	134	1957	353-1073		Iodide zirconium	Same as above.
9	134	1957	333-673		Iodide zirconium	Same as above.
10	134	1957	593-1253		Iodide zirconium	Same as above.
11	134	1957	333-1213		Iodide zirconium	Same as above.
12	134	1957	393-1033		Iodide zirconium	Same as above.
13	134	1957	413-973		Iodide zirconium	Same as above.
14	159	1950	298-1400			2.15 Hf; sample supplied by the Foote Mineral Co.; corrected for impurities.
15	150	1957	323-1154			99.91 Zr, 0.03 Fe, 0.02 C, and 0.0145 Hf.
16	378	1950	53-298			2.15 Hf; corrected for impurities.
17	379	1951	14-298			0.35 Fe, 0.05 Hf, 0.02 C, 0.004 N_2, and ~0.005 others; pellets; annealed under vacuum for 15 min. at 800 C; corrected for Fe impurity.
18	429	1951	298-1800			Same as above.

SPECIFIC HEAT OF
CADMIUM + MAGNESIUM
Cd + Mg (MgCd)

FIG 72

SPECIFICATION TABLE NO. 72 SPECIFIC HEAT OF CADMIUM + MAGNESIUM, Cd + Mg (MgCd)

[For Data Reported in Figure and Table No. 72]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	415	1952	10-304		MgCd	82. 5 Cd, 17. 5 Mg; sealed in Pyrex tube containing one half atm. of pure helium; held 10 days at 325 C, then held 2 days at 225 C and finally allowed to cool slowly to room temperature.
2	363	1957	293-547		MgCd	50. 52 ± 0. 04 at % Cd; stored in desicator for 5 yrs; before measurement series 1 MgCd sample was held at room temperature for 6 days; series 2 MgCd sample held in furnace at final temperature for 30 hrs.

FIG.

SPECIFICATION TABLE NO. 74 SPECIFIC HEAT OF CADMIUM + MAGNESIUM, Cd + Mg ($MgCd_3$)

[For Data Reported in Figure and Table No. 74]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	48	1954	12-320		$MgCd_3$	< 0. 01 impurities for each metal; magnesium prepared by National Lead Co.; cadmium prepared by Anaconda Mining Co.
2	363	1957	202-280		$MgCd_3$	74. 98 ±0. 04 at % Cd; stored at room temperature in desicator for 7 months under He atm.
3	381	1955	295-553		$MgCd_3$	74. 98 Cd.
4	382	1958	307-384		Alloy No. 1	77. 2 at % Cd.
5	382	1958	306-368		Alloy No. 1	Same as above; additional heat treatment.
6	382	1958	299-378		Alloy No. 2	75. 9 at % Cd.
7	382	1958	300-370		Alloy No. 3	73. 0 at % Cd.

SPECIFIC HEAT OF
COBALT + DYSPROSIUM
Co+Dy (DyCo$_5$)

FIG 78

SPECIFICATION TABLE NO. 78 SPECIFIC HEAT OF COBALT + DYSPROSIUM, Co + Dy ($DyCo_5$)

[For Data Reported in Figure and Table No. 78]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	383	1961	11-466	≤2.0	$DyCo_5$	Almost pure $DyCo_5$; prepared by levitation melting to fuse together stoichiometric quantities of component metals; Dy sample contained 0.2 Ta, 0.1 Ca; Co sample contained spectroscopic traces of metallic impurities.

FIG 82

SPECIFICATION TABLE NO. 82 SPECIFIC HEAT OF COPPER + GALLIUM Cu + Ga

[For Data Reported in Figure and Table No. 82]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	384	1962	348-438	±0.5	17.2 atm % Gallium-copper alloy	94.18 Cu, 15.80 Ga; prepared from 99.99 Ga, 99.999$^+$ Cu.
2	384	1962	783-963	±0.5	Same as above	Same as above.
3	384	1962	373-573	±0.5	Same as above	Same as above.
4	384	1962	448-963	±0.5	Same as above	Same as above.
5	384	1962	403-583	±0.5	Same as above	Same as above.
6	384	1962	338-568	±0.5	Same as above	Same as above.
7	384	1962	348-583	±0.5	Same as above	Same as above.
8	384	1962	638-883	±0.5	Same as above	Same as above.
9	384	1962	338-578	±0.5	Same as above	Same as above.
10	384	1962	328-598	±0.5	Same as above	Same as above.
11	384	1962	328-568	±0.5	Same as above	Same as above.
12	384	1962	378-568	±0.5	Same as above	Same as above.
13	384	1962	338-578	±0.5	Same as above	Same as above.
14	384	1962	338-623	±0.5	Same as above	Same as above.
15	384	1962	328-578	±0.5	Same as above	Same as above.
16	384	1962	328-953	±0.5	Same as above	Same as above.
17	384	1962	348-663	±0.5	Same as above	Same as above.
18	384	1962	348-593	±0.5	Same as above	Same as above.

FIG 86-2

SPECIFICATION TABLE NO. 86 SPECIFIC HEAT OF COPPER + NICKEL Cu + Ni

[For Data Reported in Figure and Table No. 86]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	55	1930	15-201	1.5	Constantan	60 Cu, 40 Ni.
2	387	1940	1.2-4.2		$Cu_{80}Ni_{20}$	79.73 Cu, 20.27 Ni; prepared from 99.99 Cu and 99.98 Ni; small amounts (0.01-0.04% Al) added to alloy, melts as deoxidizers; melted; held at 200 C below melting temperature for 1 to 2 hrs and slowly cooled.
3	387	1940	10-20		$Cu_{80}Ni_{20}$	Same as above.
4	387	1940	1.1-4.3		Constantan	$Cu_{60}Ni_{40}$; 59.84 Cu and 99.98 Ni; small amounts Al added as deoxidizer; melted; held at 200 C below melting temperature for 1 to 2 hrs and slowly cooled.
5	387	1940	9-20		Constantan	Same as above.
6	388	1956	1.8-4.0	7		65 Cu, 35 Ni; specimen supplied by Westinghouse Corp; annealed and cold worked after annealing; capsule contained specimen.
7	388	1956	1.6-4.2	7		Same as above; annealed; solid sample.
8	388	1956	1.4-4.2	7		65 Cu, 35 Ni; specimen supplied by Ford Motor Co.; annealed; solid sample.
9	388	1956	1.3-4.2			60 Cu, 40 Ni; specimen supplied by Westinghouse Corp; annealed in argon atmosphere for 24 hrs at temperature 30 C below solidus curve.
10	388	1956	1.6-4.1			75 Cu, 25 Ni; same as above.
11	388	1956	2.1-4.2			90 Cu, 10 Ni; same as above.
12	389	1966	0.05-0.15			54.48 Cu, 2.67 Mn, 0.17 Fe, 0.01 C, <0.02 Zn, <0.01 Si, <0.005 Pb, remainder Ni; specimen from Driver-Harris Co.
13	349	1962	1.4-4.3	≤2	Ni(45) Cu(55)	56.92 Cu, 43.01 Ni; annealed under vacuum at 1100 C for 72 hrs; etched with 30 ml HNO_3 and 20 ml CH_3COOH.
14	349	1962	1.4-4.3	≤2	Ni(48) Cu(52)	54.09 Cu, 45.80 Ni; same as above.
15	386	1963	0.3-4.0	1	Constantan	57 Cu, 43 Ni.

SPECIFICATION TABLE NO. 87 SPECIFIC HEAT OF COPPER + ZINC Cu + Zn

[For Data Reported in Figure and Table No. 87]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	52	1941	310-892		Brass	51. 8 Cu, 48. 17 An, 0. 03 Pb, and traces of Fe; β-phase; measured in argon atmosphere at reduced pressure.
2	390	1962	1. 4-4. 2			51. 45 Cu, 48. 65 Zn; prepared from 99. 999 Cu and 99. 999 Zn by induction melting under argon atmosphere; annealed and quenched to insure presence of β-phase.
3	390	1962	1. 4-4. 2			53. 09 Cu, 46. 92 Zn; same as above.
4	390	1962	1. 4-4. 2			54. 51 Cu, 45. 49 Zn; same as above.
5	390	1962	1. 4-4. 1			56. 76 Cu, 43. 24 Zn; same as above; annealed for 20 min at 830 C; quenched twice from 810 C.
6	391	1967	298-800		Alpha Brass Alloy No. 1	79. 75 Cu, 20. 22 Zn, 0. 015 Fe, 0. 01 Ni, 0. 003 Pb.
7	391	1967	298-800		Alpha Brass Alloy No. 2	70. 42 Cu, 29. 445 Zn, 0. 05 Pb, 0. 045 Sn, 0. 02 Fe, 0. 02 Ni.
8	391	1967	298-800		Alpha Brass Alloy No. 3	65. 18 Cu, 34. 815 Zn, 0. 002 Fe, 0. 002 Ni, 0. 001 Pb.
9	418	1959	328-590	< ±4. 0		64. 80 Cu and 35. 20 Zn; annealed and homogenized for several days; cooled from 700 C; measured under H_2 atmosphere.
10	418	1959	331-595	< ±4. 0		64. 80 Cu and 35. 20 Zn; annealed and homogenized for several days; heated for 200 hrs below 200 C; measured under H_2 atmosphere.
11	418	1959	332-641	< ±4. 0		69. 89 Cu and 30. 11 Zn; annealed and homogenized for several days; cooled from 700 C; measured under H_2 atmosphere.
12	418	1959	325-629	< ±4. 0		69. 89 Cu and 30. 11 Zn; annealed and homogenized for several days; heated for 200 hrs below 200 C; measured under H_2 atmosphere.
13	418	1959	332-632	< ±4. 0		69. 89 Cu and 30. 11 Zn; annealed and homogenized for several days; cooled from 700 C; measured under H_2 atmosphere.
14	418	1959	326-686	< ±4. 0		69. 89 Cu and 30. 11 Zn; annealed and homogenized for several days; heated for 300 hrs below 230 C; measured under H_2 atmosphere.
15	418	1959	367-669	< ±4. 0		75. 52 Cu and 24. 48 Zn; annealed and homogenized for several days; cooled from 700 C. measured under H_2 atmosphere.
16	418	1959	323-662	< ±4. 0		75. 52 Cu and 24. 48 Zn; annealed and homogenized for several days; heated for 200 hrs below 200 C; measured under H_2 atmosphere.
17	418	1959	325-661	< ±4. 0		80. 29 Cu and 19. 71 Zn; annealed and homogenized for several days; cooled from 700 C. measured under H_2 atmosphere.
18	418	1959	330-673	< ±4. 0		80. 29 Cu and 19. 71 Zn; annealed and homogenized for several days; heated for 200 hrs below 200 C; measured under H_2 atmosphere.

SPECIFICATION TABLE NO. 87 (continued)

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
19	418	1959	380-684	< ±4.0		80.29 Cu and 19.71 Zn; annealed and homogenized for several days; heated for 300 hrs below 200 C; measured under H_2 atmosphere.
20	418	1959	327-626	< ±4.0		89.72 Cu and 10.28 Zn; annealed and homogenized for several days; cooled from 700 C, measured under H_2 atmosphere.
21	418	1959	337-598	< ±4.0		89.72 Cu and 10.28 Zn; annealed and homogenized for several days; heated for 200 hrs below 200 C; measured under H_2 atmosphere.
22	417	1961	16-301	±0.5	Alloy No. 1	90.05 Cu, 9.93 Zn, 0.005 Fe, 0.003 Pb, and 0.001 Bi; vacuum annealed for 24 hrs at 500 C and furnace cooled.
23	417	1961	17-298	±0.5	Alloy No. 2	79.75 Cu, 20.22 Zn, 0.015 Fe, 0.01 Ni and 0.003 Pb; same as above.
24	417	1961	16-303	±0.5	Alloy No. 4	65.18 Cu, 34.81 Zn, 0.002 Fe, 0.002 Ni, and 0.001 Pb; same as above.

SPECIFIC HEAT OF
MANGANESE + COPPER
Mn+Cu

FIG 95

SPECIFICATION TABLE NO. 95 SPECIFIC HEAT OF MANGANESE + COPPER Mn + Cu

[For Data Reported in Figure and Table No. 95]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	230	1961	79-386		Cu-Mn alloy 85 at. % Mn	83 Mn, 17 Cu; prepared by melting Analar grade manganese and copper together in argon arc furnace.
2	230	1961	79-307		Cu-Mn alloy 65 at. % Mn	61.6 Mn, 38.4 Cu; same as above.
3	230	1961	79-320		Cu-Mn alloy 80 at. % Mn	77.5 Mn, 22.5 Cu; same as above.

SPECIFIC HEAT OF NICKEL+CHROMIUM Ni+Cr

FIG 100

SPECIFICATION TABLE NO. 100 SPECIFIC HEAT OF NICKEL + CHROMIUM Ni + Cr

[For Data Reported in Figure and Table No. 100]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	233	1957	400-800		1.8 at. %	98.4 Ni, 1.60 Cr; prepared from 99.96 Ni, 0.002 S, 0.001 Cu, 0.003 Si, 0.03 Fe; and 99.94 Cr, 0.01 Fe. 0.001 Cu, 0.005 Mo, 0.04 Si, 0.009 Sn; alloys homogenized 2 wks at 1200 C.
2	233	1957	400-800		2.5 at. %	97.78 Ni, 2.22 Cr; same as above.
3	233	1957	400-800		4.4 at. %	96.10 Ni, 3.90 Cr; same as above.
4	233	1957	400-800		11 at. %	90.13 Ni, 9.87 Cr; same as above.
5	20	1957	800-1500	±0.3	$Ni_{0.9753}Cr_{0.0247}$	97.81 Ni, 2.19 Cr; argon atmosphere.
6	20	1959	800-1500	±0.3	$Ni_{0.9562}Cr_{0.0438}$	96.09 Ni, 3.91 Cr; argon atmosphere.
7	20	1959	800-1500	±0.3	$Ni_{0.8897}Cr_{0.1103}$	90.08 Ni, 9.92 Cr; argon atmosphere.
8	20	1959	800-1500	±0.3	$Ni_{0.9818}Cr_{0.0182}$	98.39 Ni, 1.61 Cr; argon atmosphere.
9	234	1963	298-1600		Chromel P	90.0 Ni, 10 Cr; sample supplied by Hoskins Mfg. Co.
10	395	1963	338-598			90.00 Ni, 10.00 Cr; specimen slowly cooled in calorimeter from about 400 C.
11	395	1963	368-618			Same as above; specimen slowly cooled from above 200 C in calorimeter.
12	395	1963	383-843			Same as above; specimen slowly cooled in calorimeter from above 350 C.
13	395	1963	428-898			Same as above; specimen slowly cooled in calorimeter from above 600 C; held at 120 C for approx 1 hr prior to data.
14	395	1963	528-968			Same as above; specimen slowly cooled in calorimeter from above 600 C.
15	395	1963	608-938			Same as above; specimen held at 300 C for 7.5 hrs prior to data.
16	395	1963	658-928			Same as above; specimen slowly cooled in calorimeter from above 600 C.
17	395	1963	598-968			Same as above; specimen slowly cooled in calorimeter from above 600 C.
18	395	1963	338-608			80.0 Ni, 20.0 Cr; specimen slowly cooled in calorimeter from about 200 C.
19	395	1963	398-658			Same as above; specimen slowly cooled in calorimeter from above 400 C.
20	395	1963	528-978			Same as above; specimen slowly cooled in calorimeter from above 640 C.
21	395	1963	578-978			Same as above; specimen slowly cooled in calorimeter from 700 C.
22	395	1963	628-968			Same as above; specimen slowly cooled in calorimeter from 620 C.
23	395	1963	473-953			Same as above; specimen slowly cooled in calorimeter from above 600 C.
24	395	1963	513-973			Same as above; specimen slowly cooled in calorimeter from above 600 C.
25	395	1963	358-668			95 Ni, 5 Cr; initial run of alloy homogenized at 1200 F for 1 wk prior to machining into specimen.
26	395	1963	338-618			Same as above; specimen slowly cooled in calorimeter from above 600 C.

SPECIFICATION TABLE NO. 100 (continued)

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
27	395	1963	608-968			Same as above; specimen slowly cooled in calorimeter from above 600 C.
28	395	1963	578-848			Same as above; specimen slowly cooled in calorimeter from above 250 C.
29	395	1963	608-968			Same as above; specimen slowly cooled in calorimeter from above 575 C.

SPECIFICATION TABLE NO. 101 SPECIFIC HEAT OF NICKEL + COPPER Ni + Cu

[For Data Reported in Figure and Table No. 101]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	387	1940	1. 1-4. 0		$Cu_{20}Ni_{80}$	80. 39 Ni, 19. 61 Cu; prepared from 99. 98 Ni and 99. 99 Cu; small amounts of Al added to alloy melts as deoxidizers; melted; held at 200 C below melting temperature for 1 to 2 hrs and slowly cooled.
2	387	1940	10-20		Same as above	Same as above.
3	387	1940	1. 1-4. 2		$Cu_{40}Ni_{60}$	60. 09 Ni, 39. 91 Cu; prepared from 99. 99 Cu and 99. 98 Ni; small amounts of Al added to alloy melts as deoxidizers; melted; held at 200 C below melting temperature for 1 to 2 hrs and slowly cooled.
4	387	1940	10-20		Same as above	Same as above.
5	293	1941	79-273			33. 6 Ni, 66. 4 Cu.
6	18	1956	323-883	±0. 5	90% Nickel alloy	90. 05 Ni, bal. Cu.
7	349	1962	1. 6-4. 4	≤2	Ni(90) Cu(10)	89. 25 Ni, 10. 66 Cu; annealed under vacuum at 1100 C for 72 hrs; etched in 30 ml HNO_3 and 20 ml CH_3COOH.
8	18	1956	323-883	±0. 5	75% Nickel alloy	75. 07 Ni, bal. Cu.
9	349	1962	1. 5-4. 3	≤2	Ni(55) Cu(45)	53. 01 Ni, 46. 92 Cu; annealed under vacuum at 1100 C for 72 hrs, etched with 30 ml HNO_3 and 20 ml CH_3COOH.
10	18	1956	308-863	±0. 5	50% Nickel alloy	50. 04 Ni, bal. Cu.
11	293	1941	79-273			50. 4 Ni, 49. 6 Cu.
12	343	1934	83-670	1. 5-2	Alloy 1	94. 0 Ni.
13	343	1934	84-634	1. 5-2	Alloy 2	87. 2 Ni.
14	343	1934	81-660	1. 5-2	Alloy 3	78. 8 Ni.

FIG 119

SPECIFICATION TABLE NO. 119 SPECIFIC HEAT OF TITANIUM + MOLYBDENUM, Ti + Mo

[For Data Reported in Figure and Table No. 119]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	401	1961	1.1-4.3	± 1.0	M-6	7.54 at % Mo; prepared from 99.92 Ti and 99.9 Mo by melting together in a furnace using "gettered" argon atmosphere; remelted at least six times to promote homogeneity; quenched from region of solid solubility to room temperature.
2	401	1961	1.2-4.3	± 1.0	M-8	6.25 at % Mo. same as above.
3	401	1961	1.2-4.2	± 1.0	M-9	6.50 at % Mo. same as above.
4	401	1961	1.2-4.3	± 1.0	M-10	8.60 at % Mo; same as above.

Cu+Mg+Si (MgCu$_{2-x}$Si$_x$)

FIG 144

SPECIFICATION TABLE NO. 144 SPECIFIC HEAT OF COPPER + MAGNESIUM + SILICON, Cu + Mg + Si ($MgCu_{2-x}Si_x$)

[For Data Reported in Figure and Table No. 144]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	404	1966	1.6-4.1		$MgCu_{1.943}Si_{0.057}$	Prepared from: 99.99⁺ Cu, sample supplied by American Smelting and Refining Co.; 99.98 Mg, 0.001-0.003 Si, 0.001 Al, 0.001 Cu, 0.001 Fe, 0.001 Mn, resublimed grade sample supplied by Dow Chemical Co.; melted; stirred for several minutes; quenched; after casting each sample held in Ar or He gas at 600-700 C for 72-98 hrs.
2	404	1966	1.5-4.0		$MgCu_{1.897}Si_{0.103}$	Same as above.
3	404	1966	1.6-4.1		$MgCu_{1.873}Si_{0.127}$	Same as above.
4	404	1966	1.5-4.0		$MgCu_{1.833}Si_{0.167}$	Same as above.
5	404	1966	1.7-3.7		$MgCu_{1.816}Si_{0.184}$	Same as above.
6	404	1966	1.7-4.0		$MgCu_{1.793}Si_{0.207}$	Same as above.
7	404	1966	1.7-4.1		$MgCu_{1.778}Si_{0.222}$	Same as above.
8	404	1966	2.5-3.7		$MgCu_{1.757}Si_{0.243}$	Same as above.
9	404	1966	1.7-4.1		$MgCu_{1.746}Si_{0.254}$	Same as above.
10	404	1966	1.7-4.0		$MgCu_{1.733}Si_{0.267}$	Same as above.
11	404	1966	1.4-3.4		$MgCu_{1.683}Si_{0.317}$	Same as above.
12	404	1966	1.7-3.8		$MgCu_{1.617}Si_{0.383}$	Same as above.
13	404	1966	1.6-4.1		$MgCu_{1.518}Si_{0.482}$	Same as above.
14	404	1966	1.6-4.1		$MgCu_{1.415}Si_{0.585}$	Same as above.
15	404	1966	1.7-4.0		$MgCu_{1.344}Si_{0.656}$	Same as above.
16	404	1966	1.5-4.0		$MgCu_{1.308}Si_{0.692}$	Same as above.
17	404	1966	1.8-4.0		$MgCu_{1.248}Si_{0.752}$	Same as above.

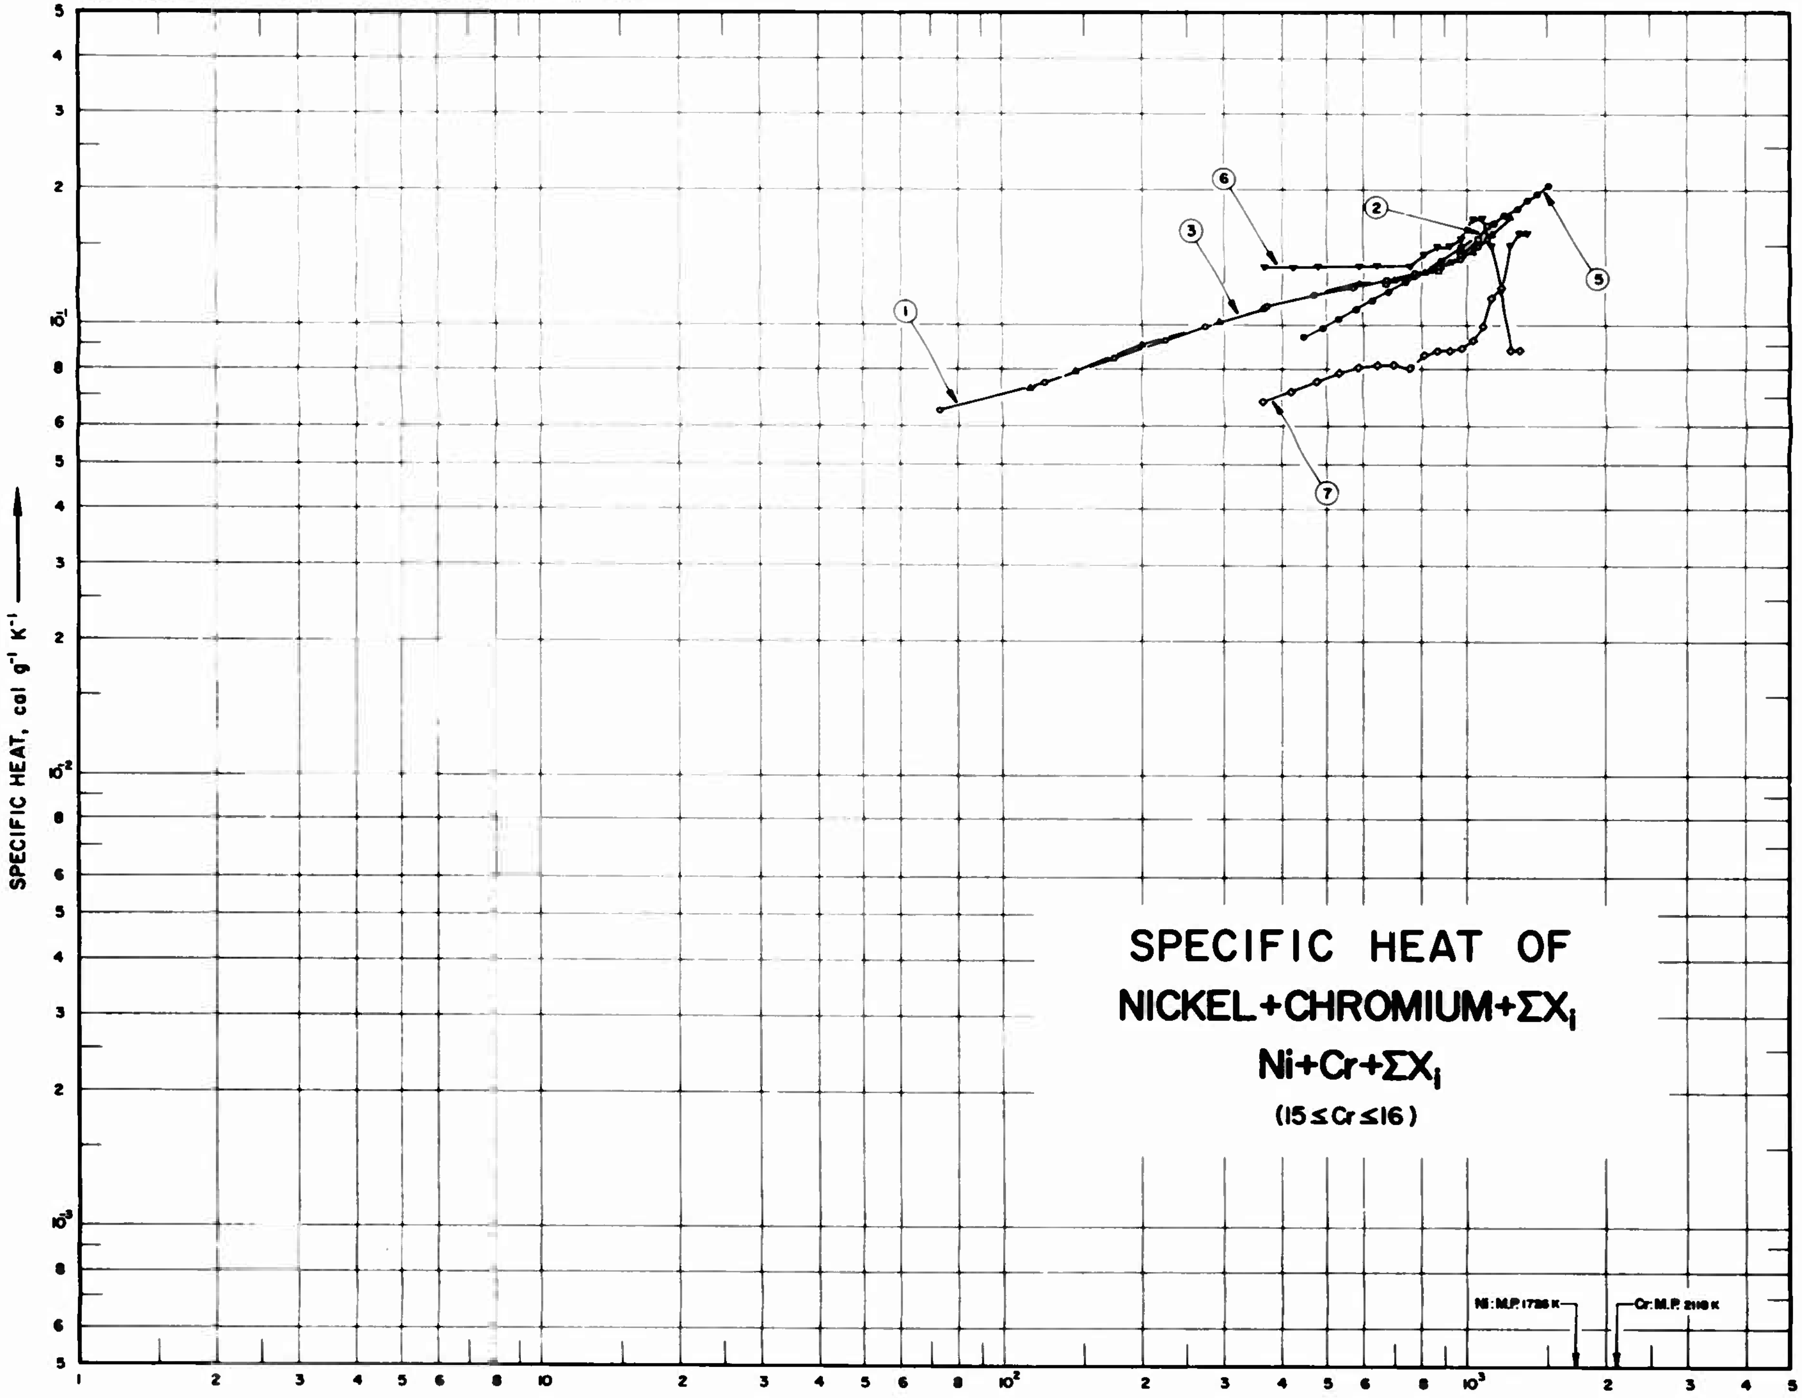

FIG 151

SPECIFICATION TABLE NO. 151 SPECIFIC HEAT OF NICKEL + CHROMIUM + ΣX_i, $Ni + Cr + \Sigma X_i$ $(15 \leq Cr \leq 16)$

[For Data Reported in Figure and Table No. 151]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	243	1952	73-1123		Inconel	Nominal composition: 77 Ni, 15 Cr, 7 Fe.
2	243	1952	73-1123		Inconel X	Nominal composition: 73 Ni, 15 Cr, 7 Fe, 2.5 Ti.
3	10	1958	116-1255		Annealed Inconel	Nominal composition: 78 Ni, 15 Cr, 7 Fe, 0.35 Mn, 0.2 Si, 0.04 C; sample supplied by the International Nickel Co., Inc.; specimen sealed in helium capsule; annealed for 3 hours at 1600 F, held for 15 min at 1800 F and air cooled; density (32 F) = 390 lb ft^{-3}.
4	10	1958	116-1255		Inconel X	Nominal composition: 73 Ni, 15 Cr, 7 Fe, 2.5 Ti, 1 Nb, 0.9 Al, 0.7 Mn, 0.4 Si, 0.04 C; sample supplied by the International Nickel Co., Inc.; specimen sealed in helium in capsule; solution treated by heating for 3 hrs at 2100 F and air cooled; double aged for 24 hrs at 1550 F and air cooled; then held for 20 hrs at 1300 F and air cooled; density (32 F) = 380 lb ft^{-3}.
5	75	1958	445-1517	0.66-2.9	Hastelloy R-235	Nominal composition: 66.85 Ni (bal.), 15.5 Cr, 10 Fe, 5 Mo, 2.5 Ti, 0.15 C; measured in a helium atmosphere.
6	249	1959	366-1311	5-10	Inconel 702	Nominal: 80.0 Ni, 15.0 Cr, 3.0 Al, 0.5 Ti, 0.35 Fe, 0.05 C; heated to 1975 F for 0.5 hr; air cooled; heated to 1400 F for 5 hrs; air cooled.
7	249	1959	366-1311	5-10	Inconel X	Nominal: ≥70 Ni, 15.0 Cr, 7.0 Fe, 2.5 Ti, 0.95 Nb, 0.70 Al, ≤0.2 Cu, ≤0.08 C; heated at 2100 F for 2 hrs; air cooled; heated to 1550 F for 24 hrs; air cooled; heated to 1300 F for 20 hrs; air cooled.
8	248	1960	273-1173	± 0.3	Sample 1	76 Ni, 15 Cr, 9 Fe.
9	248	1960	273-1173	± 0.3	Sample 2	Same as above.
10	248	1960	273-1173	± 0.3	Sample 3	Same as above.

SPECIFICATION TABLE NO. 183 SPECIFIC HEAT OF IRON + MANGANESE + ΣX_i, Fe + Mn + ΣX_i ($10 < Mn \leq 50$), ALLOY STEEL GROUP I

[For Data Reported in Figure and Table No. 183]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	349	1962	1.3-4.1	≤2.0		83.7 Fe, 11.0 Mn, and 5.3 C; annealed at 1100 C for 72 hrs in He + 8% H_2 gas atmosphere; etched in 1-3% HNO_3.
2	55	1930	20-205			80.6 Fe and 19.4 Mn.
3	310	1962	140-1180			79.005 Fe, 20.55 Mn, 0.39 Si, and 0.055 C.
4	349	1962	1.5-4.2	≤2.0		76.4 Fe, 20.0 Mn, and 3.6 C; annealed at 1100 C for 72 hrs, under He + 8% H_2 gas atmosphere; etched in 1-3% HNO_3.
5	55	1930	15-216	1.5		70 Fe and 30 Mn.
6	222	1959	298-1400	0.5	Sample No. 30 Mn	70.0 Fe and 30.0 Mn; homogenized for 4 days at 1350 C under helium atmosphere; air cooled to room temperature.
7	349	1962	1.3-4.3	≤2.0		66.4 Fe, 30.0 Mn, and 3.6 C; annealed at 1100 C for 72 hrs, under He + 8% H_2 gas atmosphere; etched in 1-3% HNO_3.
8	310	1962	140-1140			65.935 Fe, 32.8 Mn, 1.21 Si, and 0.055 C.
9	310	1962	140-1240			59.165 Fe, 40.4 Mn, 0.41 Si, and 0.025 C.
10	297	1959	1.6-4.6			55.4 Fe and 44.6 Mn; induction melted.
11	297	1959	1.7-4.6			55.0 Fe, 44.1 Mn and 0.9 C; induction melted.
12	222	1959	298-1400	0.5	Sample No. 50 Mn	51.6 Fe and 48.4 Mn; homogenized for 4 days at 1350 C under helium atmosphere; air cooled to room temperature.
13	55	1930	16-205	1.5		50.0 Fe and 50.0 Mn.
14	388	1956	2.2-4.1	7.0		90.0 Fe and 10.0 Mn.

SPECIFICATION TABLE NO. 184 SPECIFIC HEAT OF IRON + MANGANESE + CARBON, Fe + Mn + C, ALLOY STEEL GROUP I

[For Data Reported in Figure and Table No. 184]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	408	1940	573-1223			0.72 Mn, 0.5 C, 0.30 Si, 0.035 P, and 0.03 S.
2	83	1954	443-1063		Steel T-261	1.0 Mn and 0.75 C.
3	83	1954	343-1063		Steel T-262	Same as above.
4	83	1954	343-1063		Steel T-310	Same as above.
5	83	1954	363-1063		Steel T-311	Same as above.
6	83	1954	363-1063		Steel T-270	Same as above.
7	83	1954	343-1063		Steel T-278	Same as above.
8	83	1954	403-1083		Steel T-279	Same as above.
9	83	1954	443-1063		Steel Pearlite	Same as above.
10	83	1954	428-1123		Steel Pearlite	Same as above.
11	83	1954	363-1123		Steel Pearlite	Same as above.
12	83	1954	1008-1083		Steel Austenite	Same as above.
13	83	1954	1023-1123		Steel Austenite	Same as above.
14	33	1957	353-993	≤0.9	Steel B	97.969 Fe, 1.03 Mn, 0.97 C, 0.024 S, <0.005 Si, and <0.002 P; free cooled.
15	33	1957	353-993	≤0.9	Steel B	Same as above; slow cooled.
16	33	1957	993-1218	<0.9	Austenite	
17	408	1940	573-1223			1.04 Mn, 0.33 C, 0.11 P, 0.1 Si, and 0.05 S.
*18	104	1946	348-1148	2.0	Alloy Steel No. 4	1.51 Mn, 0.23 C, 0.12 Si, 0.105 Cu, 0.06 Cr, 0.038 B, 0.037 P, 0.04 Ni, 0.033 As, 0.025 Mo, and 0.015 Al; annealed at 860 C; density (15 C) = 489 lb ft^{-3}.
19	54	1954	673-1123		Eutectoid Steel	0.25-1.85 Mn, 0.79-0.80 C, 0.22 Si, 0.011-0.02 P, and 0.011-0.016 S; pearlite.

SPECIFICATION TABLE NO. 185 SPECIFIC HEAT OF IRON + NICKEL + ΣX_i, Fe + Ni + ΣX_i, ALLOY STEEL GROUP I

[For Data Reported in Figure and Table No. 185]

Curve No.	Ref. No.	Year	Temp. Range, K	Reported Error, %	Name and Specimen Designation	Composition (weight percent), Specifications and Remarks
1	104	1946	348-1523	2-4	Alloy Steel No. 9	3.47 Ni, 0.55 Mn, 0.325 C, 0.18 Si, 0.17 Cr, 0.086 Cu, 0.04 Mo, 0.034 S, 0.032 P, 0.023 As, 0.01 V and 0.006 Al; annealed at 860 C; density (15 C) = 490 lb ft^{-3}.
2	236	1940	473-1648			90.9 Fe, 9.1 Ni; prepared from electrolytically deposited raw material; vacuum melted; heated 5 hrs at 1100 C and cooled slowly.
3	236	1940	448-1573			80.7 Fe and 19.3 Ni.
4	236	1940	423-1573			70.5 Fe and 29.5 Ni.
5	410	1965		0.5-4.0	Invar	64.6 Fe, 35.3 Ni, and 0.05 Co; sample supplied by Carpenter Steel Co.
6	236	1940	423-1673			61.0 Fe and 36.0 Ni.
7	236	1940	473-1673			50.98 Fe and 49.02 Ni.
8	349	1962	1.4-4.3	≤2	$Ni_{40}Fe_{60}$	58.95 Fe and 40.97 Ni; annealed under He + 8% H_2 gas atmosphere at 1100 C for 72 hrs; etched with 30 ml HNO_3 and 20 ml CH_3COOH.
9	349	1962	1.5-4.3	≤2	$Ni_{45}Fe_{55}$	54.09 Fe and 45.77 Ni; same as above.

398	7403	Hoare, F.E., Matthews, J.C., and Walling, J.C., Proc. Roy. Soc. (London), A216 (1127), 502-15, 1953.
399	32927	Ziegler, W.T. and Mullins, J.C., Cryogenics, 4 (1), 39-40, 1964.
400	40631	Jelinek, F.J., Shickell, W.D., and Gerstein, B.C., J. Phys. Chem. Solids, 28 (2), 267-70, 1967.
401	23357	Hake, R.R., Phys. Rev., 123, 1986-94, 1961.
402	31690	Proshina, Z.V. and Rezukhina, T.N., Russ. J. Phys. Chem., 36 (8), 941-2, 1962.
403	39917	Hoare, F.E. and Wheeler, J.C.C., Phys. Letters, 23 (7), 402-3, 1966.
404	39473	Klar, E., Mallya, R.M., and Craig, R.S., J. Chem. Phys., 45 (3), 934-6, 1966.
405	31065	Starke, E.A., Jr., M.S. Thesis, Univ. Illinois, 1-48, 1961.
406	1712	Redmond, R.F. and Lones, J., ORNL-1342, 3-20, 1952. [AD 3 665]
407	23739	Gregory, B. and Bray, H.J., Metallurgia, 63, 276-8, 1961.
408	33186	Bartenev, G.M., J. Tech. Phys. (USSR), 10, 1074-84, 1940.
409	39743	Bernard, H.W., M.S. Thesis, Penn. State Univ., 1-59, 1961.
410	38509	Burford, J.C. and Graham, G.M., Can. J. Phys., 43 (10), 1915-7, 1965.
411	3919	Gel'd, P.V., Kuprovskii, B.B., and Serebrennikov, N.N., Teploenergetika (USSR), 3 (6), 45-51, 1956.
412	21240	Liusternik, V.E., Phys. Metals Metallog. (USSR), 7 (3), 40-3, 1959.
413	35093	DuChatenier, F.J., Boerstoel, B.M., and DeNobel, J., Physica, 31 (7), 1061-2, 1965.
414	26610	Powers, W.C. and Blalock, G.C., CF-53-9-98, 1-9, 1953.
415	7366	Craig, R.S., Satterthwaite, C.B., and Wallace, W.E., USAEC Publ., NYO-946, 1-28, 1952.
416	8143	Holden, R.B. and Kopelman, B., USAEC, SEP-128, 1-17, 1953.
417	41263	Huffstuller, M.C., Jr., Ph.D. Thesis, Univ. California, 1-52, 1961.
418	32370	Kussman, Von A. and Wollenberger, H., Z. Metallkunde, 50, 94-100, 1959.
419	38419	Brewer, D.F., Howe, D.R., and Turrell, B.G., Phys. Letters, 13 (3), 204-5, 1964.
420	40967	Proctor, W., Scurlock, R.G., and Wray, E.M., Proc. Phys. Soc. (London), 90 (3), 697-705, 1967.
421	6335	Mendelssohn, K. and Moore, J.R., Proc. Roy. Soc. (London), 151A, 334-41, 1935.
422	44070	Lounasmaa, O.V. and Sundstrom, L.J., Phys. Rev., 158 (3), 591-600, 1967.
423	30698	Pollitzer, F., Z. Electrochem., 17, 5-14, 1911.
424	35142	Taylor, W.A., McCollum, D.C., Passenheim, B.C., and White, H.W., Phys. Rev., 161 (3), 652-5, 1967.
425	19184	Evans, J.P. and Mardon, P.G., J. Phys. Chem. Solids, 10, 311-3, 1959.
426	36776	Sandenaw, T.A., J. Phys. Chem. Solids, 26 (6), 1075-8, 1965.
427	20619	Lyubimov, A.P. and Belashchenko, D.K., Sbor. Moskovskogo Inst. Stali, 33, 3-11, 1955.
428	7294	Pallister, P.R., J. Iron Steel Inst., 185, 474-82, 1957.
429	2868	Skinner, G.B., Ohio State Univ. Ph.D. Thesis, Univ. Microfilms Publ. 51-25473, 115pp., 1951.

Material Index

MATERIAL INDEX TO SPECIFIC HEAT COMPANION VOLUMES 4, 5, AND 6

Material Name	Vol.	Page
Ditungsten boride (W_2B)	5	385
Ditungsten pentaboride (W_2B_5)	5	388
Tungsten carbide (WC)	5	460
Tungsten carbide + Cobalt, cermet (WC + Co)	5	1282
Tungsten trioxide (WO_3)	5	256
Tungsten disilicide (WSi_2)	5	610
Tungstic acid anhydride (see Tungsten trioxide)		
Uranic chloride (see Uranium tetrachloride)		
Uranic iodide (see Uranium tetraiodide)		
Uranic oxide (see Uranium dioxide)		
Uranium	4	268
Uranium carbides:		
UC	5	463
UC_2	5	466
U_2C_3	5	472
UC_X (nonstoichiometric)	5	469
Uranium carbide (UC)	5	463
Uranium dicarbide (UC_2)	5	466
Diuranium tricarbide (U_2C_3)	5	472
Uranium carbide, nonstoichiometric (UC_X)	5	469
Uranium chlorides:		
UCl_3	5	896
UCl_4	5	899
Uranium trichloride (UCl_3)	5	896
Uranium tetrachloride (UCl_4)	5	899
Uranium fluorides:		
UF_4	5	1015
UF_6	5	1018
Uranium tetrafluoride (UF_4)	5	1015
Uranium hexafluoride (UF_6)	5	1018
Uranium trihydride (UH_3)	5	1050
Uranium tetraiodide (UI_4)	5	513
Uranium nitrides:		
UN	5	1096
UN_X (nonstoichiometric)	5	1099

Material Name	Vol.	Page
Uranium nitride (UN)	5	1096
Uranium nitride, nonstoichiometric (UN_X)	5	1099
Uranium oxides:		
UO_2	5	259
UO_3	5	262
U_3O_8	5	265
U_4O_9	5	269
Uranium dioxide (UO_2)	5	259
Uranium trioxide (UO_3)	5	262
Triuranium octaoxide (U_3O_8)	5	265
Tetrauranium enneaoxide (see Tetrauranium nonaoxide)		
Tetrauranium nonaoxide (U_4O_9)	5	269
Uranium silcides:		
USi_2	5	619
USi_3	5	616
U_3Si	5	613
$U_3Si_2 + U_3Si$	5	622
Uranium disilicide (USi_2)	5	619
Uranium trisilicide (USi_3)	5	616
Triuranium silicide (U_3Si)	5	613
Triuranium disilicide + Triuranium monosilicide ($U_3Si_2 + U_3Si$)	5	622
Uranous uranic oxide (see Triuranium octaoxide)		
Uranyl oxide (see Uranium trioxide)		
Uranyl uranate (see Triuranium octaoxide)		
Vanadic anhydride (see Divanadium pentaoxide)		
Vanadium	4	271
Vanadium + Aluminum	4	465
Vanadium + Antimony	4	468
Vanadium + Iron	4	471
Vanadium + Tin	4	474
Vanadium + Titanium	4	477
Vanadium carbide (VC)	5	475
