SYLLABUS

This report covers the preparation of standard Engineer equipment for air transport in the C-46 cargo plane. Similar reports on the C-47 and C-54A planes have been published previously. Further study, involving other types of cargo planes, has been transferred to the Aviation Engineers, located at Geiger Field, Washington.

The results obtained indicate that the transportation of the following items of equipment in the C-46 Cargo Plane is feasible:

The D-4 Caterpillar Tractor
The D-6 Caterpillar Tractor
The D-7 Caterpillar Tractor
The D-8 Caterpillar Tractor
The No. 12 Caterpillar Motor Grader
The No. 101-D Galion Motor Grader
The No. 512 Adams Motor Grader
The No. 124-S Adams Towed Grader
The No. M-20 LeTourneau 20 Ton Tractor Crane
The Truck Mounted Quickway Crane
The Model W-2 LeTourneau Sheepsfoot Roller
The Model 67-W William Bros Rubber-Tired Roller
The 10-Ton Galion "Chief" Roller
The 5 to 8-Ton Buffalo Springfield Tandem Roller
The 2½-Ton 6 x 6 Dump Truck
The Airborne 2½-Ton 6 x 6 Dump Truck
The Class 135 Crash Truck
The 1250-Gallon Etnyre Bituminous Distributor
The Ingersoll-Rand IK-315 Compressor
The LeTourneau 8 Cubic Yard Carryall Scraper
The Iowa Model 25 Cubic Yard Per Hour
Rock Crushing and Screening Plant (2 Unit)
The T-4 Traxcavator Mounted on the 60 inch Gauge,
Non-Oscillating, D-4 Tractor

This report recommends that in any equipment list for a unit transporting its equipment by air, provision should be made for the airborne model bituminous distributor and for the factory-supplied conversion kits for the 2½-ton dump truck.

DISASSEMBLY AND LOADING OF STANDARD ENGINEER EQUIPMENT FOR TRANSPORT IN THE C-46 CARGO PLANE

I. SUBJECT

1. Scope. This report covers the disassembly, groupings, and loading of standard items of Engineer equipment for transport in the C-46 cargo plane.

II. AUTHORITY

2. Authority. The authority for this investigation is contained in a letter from the Chief of Engineers, to the President, The Engineer Board, dated 20 April 1944, file CE (20 April 44) SPENE, subject: Air Transport of Standard Engineer Equipment (Work Order DME 3388). A copy of this letter is contained in Appendix A.

III. INVESTIGATION

3. Procedure. Twenty-three items of standard Engineer equipment were dismantled by enlisted personnel and loaded into a wooden mock-up of the C-46 plane. Procedures for the disassembly and loading of the individual items of equipment into this plane are included in Appendices B through W.

4. Items of Equipment Studied. Each item of equipment was the subject of a thorough study prior to disassembly. Certain information, pictures, and diagrams were found to be generally pertinent to all pieces of equipment and are included in the body of this report. Each piece of equipment is treated separately as an appendix. The list of the equipment studied, together with the pertinent technical manual, and the appendix in which each is discussed, is as follows:

Equipment	Technical Manual	Appendix
Tractor, Crawler Type, Diesel-engine driven, 35-40 DBHP, 44-inch Gauge, Caterpillar Model D-4, with Angledozer, LeTourneau CK 4, and Power Control Unit, LeTourneau T4.	5-3112	B

5. Equipment Breakdown.

a. The task of sectionalizing various items of standard Engineer equipment into sub-assemblies which will fall within the weight and dimensional limitations of the C-46 Cargo Plane is one that should present little difficulty to mechanics familiar with the equipment. It is, of course, advisable to avoid any unnecessary dismantling, that is, stripping main sub-assemblies down more than is needed to come within the weight limitations and required size for entrance through the plane door. It is emphasized, however, that dismantling, though longer in point of time, is a great deal more desirable than cutting and installing bolt plates, since the equipment is materially weakened by the latter procedure.

b. Sometimes it may expedite dismantling procedure to make minor cuts where members not requiring appreciable structural strength are involved. This may frequently be the determining factor in bringing a certain sub-assembly within required limitations of size or weight; in addition, it may facilitate the procedure by eliminating the necessity for removal of numerous bolts. In these instances, cutting and later rewelding are advisable. Owing to size or weight, some items of equipment may require cutting of major members; instructions for cutting and reassembly of the members so cut will be found in the appropriate appendix to this report. In planning plane loads, thought should be given to the sequence of reassembly, and parts or assemblies needed first for reassembly should be in the first plane.

c. A Quickway crane, or an improvised boom mounted on a 2½-ton truck and using the truck winch for power, is recommended for handling sub-assemblies while dismantling and reassembling machines. If such devices are not available, shears or gin poles may be used, but they will require slightly more time and men. Tackle arrangement is shown in Fig. 1.

d. The weights of the various sub-assemblies of equipment are given in the appropriate appendix to this report. In transporting other items by air, the sub-assemblies should, where possible, be weighted, or the weights closely estimated for purposes of proper loading inside the planes.

e. Care should be taken, when handling dismantled machinery, to prevent damage to exposed parts. Exposed threads and other working parts subject to rust or corrosion, should be covered with grease, and openings should be stuffed with clean rags to prevent entry of foreign matter. Delicate parts should be wrapped with burlap or other cloth to prevent damage. Air lines and hydraulic lines, as a general rule, should be removed from large assemblies to prevent damage in handling. This rule applies to any easily damaged parts which can be readily removed. In most cases, the engine unit may be kept intact and with careful handling, particularly in loading, should not suffer any damage.

f. With a little ingenuity, almost any piece of standard Engineer equipment may be dismantled with tools normally carried by the using unit. The need for special pullers is eliminated by expedients. It is wise to carry a supply of miscellaneous nuts, bolts, lockwashers, cotter pins, and gasket material to replace those lost or damaged during disassembly. A sufficient quantity of welding electrodes must also be carried to reweld any members which require this work.

Electric welding only should be utilized. The members to be so joined should be "V-notched" to insure that the weld has at least the same depth as the out. Reinforcing straps should be used, and welded along the side only (it is not advisable to weld the ends). Before rewelding, the two pieces to be joined should be jacked into as nearly perfect alignment as possible. In the case of dozer yokes, the two halves can be mounted on the tractor and welded while in place. (See Fig. 2.) During reassembly, proper care should be observed in making necessary adjustments to mechanical parts which may have become disturbed during handling.

g. The tools and equipment generally required for dismantling standard Engineer equipment are as follows:

(1) First echelon equipment sets

(2) Automotive mechanics set

(3) Master mechanics set

(4) Socket set - heavy duty to 2 3/8-inch

(5) Crescent wrenches, 12-inch

(6) Open-end wrench Set to 1½-inch

(7) Pipe wrenches, 18 inch

(8) Allen wrench set

(9) 40 inch pinch bar

(10) 60 inch pinch bar

(11) 8-pound sledge hammer

(12) 12-pound sledge hammer

(13) 8-ton hydraulic jack

(14) 10-ton Porto-Power hydraulic press unit

(15) Drift pins, 12 to 18 inch

(16) Electrical welding set

(17) Acetylene welding set

6. Loading and Load Limitations.

a. In order for an airplane to fly, and for its path of flight to be controlled by its tail surfaces, it is necessary for the center of gravity (normally expressed as cg) to fall within certain limits. These limits are sometimes expressed as a percentage of the mean aerodynamic chord of the wing (% MAC). However, for weight and balance purposes in this report, the limits are expressed in inches from the reference datum line.

b. The reference datum line is at or near the nose of the airplane, and the distances from it in inches are known as station numbers. Thus station number 263 (STA 263) is 263 inches from the nose of the airplane. In order to find the cg (or balance point) of a loaded airplane, it is necessary to know the cg of the airplane without pay load, and its basic weight, as well as the weight and location of the pay load. Each airplane of one type may have a separate and different basic weight and cg because of unlike modifications, repairs, and equipment. These data for a specific airplane may be obtained from the pilot or crew chief.

c. To find the cg of a loaded airplane is a simple problem involving moments about an imaginary axis, i.e., the reference datum line. The weight of the plane and of each item of cargo is multiplied by its respective moment arm or distance in inches from the reference datum line. The sum of these moments is divided by the total weight of the airplane and its load to determine the moment arm of the loaded airplane, or the station number of the cg. For example, assume the following conditions:

A C-46 plane with its crew, fuel, oil, equipment, etc., weighing 40,740 lb, with the cg falling at STA 326; a piece of freight weighing 500 lb and centered at STA 305; and a piece of freight weighing 7500 lb and centered at STA 353.

Proceed as follows:

40,740 lb	x 326 =	13,281,240 inch pounds
500 lb	x 305 =	152,500 inch pounds
7,500 lb	x 353 =	2,647,500 inch pounds

Total weight = 48,740 lb 16,081,240 inch pounds = Total moment

Resultant moment arm or STA number of the cg:

$$\frac{16,081,240}{48,740} = 330 = \text{Station number of cg}$$

Since STA 330 is within the safe limits for cg location of a C-46 plane, it is not mandatory to adjust the load. However, the flying conditions could be improved by moving the load forward, if practical, so as to bring the cg closer to the desired position of STA 323.

d. Each cargo plane is equipped with a special slide rule known as a "Load Adjuster" which may be used to determine safe loading arrangement of the plane. Proper use of the load adjuster is dependent upon knowledge of the basic weight and index of the particular plane. The basic weight and index of a particular plane are normally obtained from a card beneath a transparent window on the back of the load adjuster case or may be obtained from the pilot or crew chief. Instructions for use accompany the load adjuster.

e. To meet the need of a rapid method of estimating proper cargo location in advance of loading by personnel not having a load adjuster available, a chart for cargo cg limits was developed. (See below.) The data upon which this chart is based were furnished by the Air Transport Command and are reasonably standard for the majority of C-46 planes. For safety, loads which have been placed by using the chart should be checked with a load adjuster, using the basic data for the specific airplane. The data upon which the chart was based follow:

Basic weight - 30,690 pounds

Basic arm - 330.75 inches

Basic index - 68

Crew - 3 members, each with 50 pounds of baggage

Gasoline - 1,400 gallons, all carried in wing tanks

Oil - 120 gallons

To use the chart, draw a horizontal line intersecting the total cargo weight as shown in the left margin. Where this line intersects the curves, draw vertical lines to the scale at the bottom of the chart. The cargo must be placed so that the cg of the cargo is between the limits thus found, and should be as near the desirable station as possible. Great care should be exercised to keep the cg of the cargo well inside of the fore and aft limits, so that the normal movement of the passengers and crew will not cause the cg to fall outside the limits; the extreme allowable limits are highly critical and it is quite dangerous to exceed them. A considerable safety factor was used in spacing the loading range on the load adjuster. (See chart on opposite page).

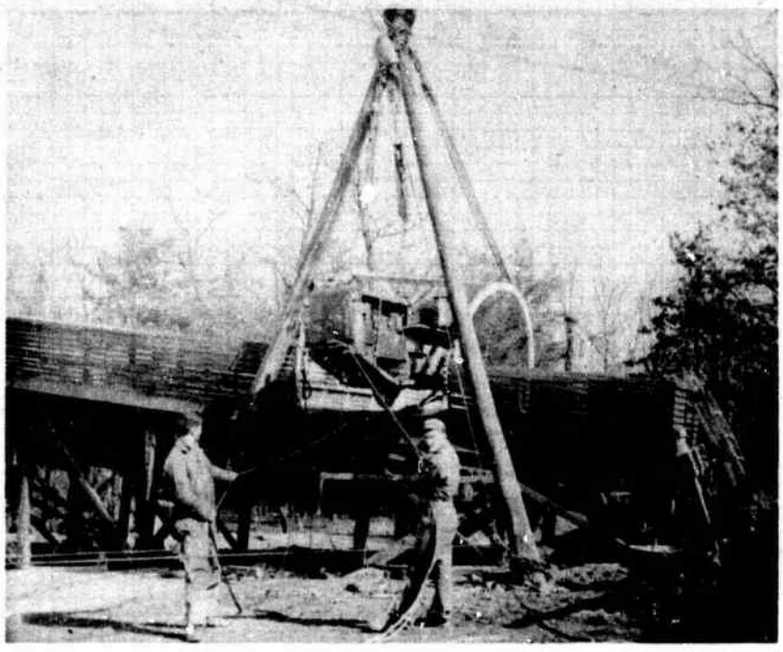

FIG. 1. TACKLE ARRANGEMENT SHOWING TYPICAL LOADING USING SHEARS.

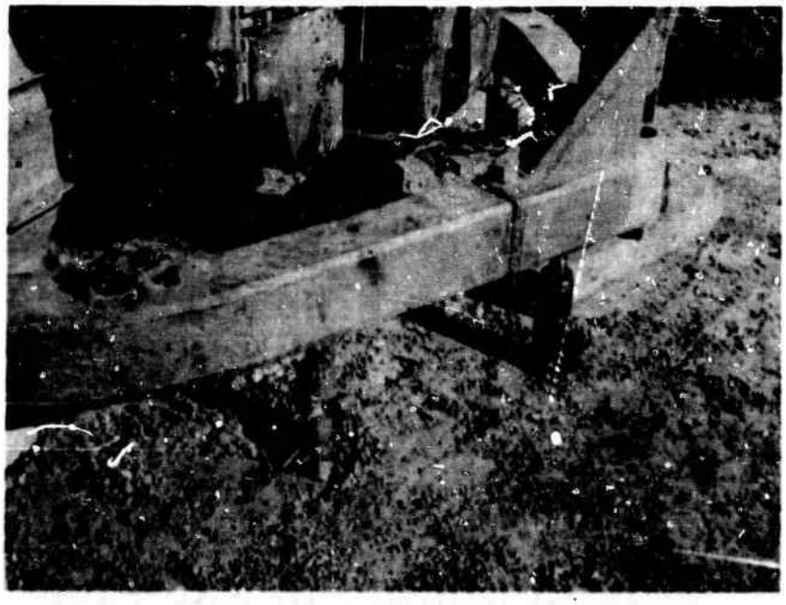

FIG. 2. DOZER YOKE, WHICH HAS BEEN CUT, REMOUNTED ON TRACTOR AND JACKED INTO PLACE FOR REWELDING.

f. In order to prevent serious damage to the plane, care must be exercised to distribute the weight of heavily concentrated loads, such as engine blocks and other large sub-assemblies of machinery. Also some means must be provided whereby large heavy pieces may be shifted fore and aft in the plane to obtain proper balance. A scheme for accomplishing both of these ends is to use sleds, as shown in Fig. 3, and the tackle arrangement, as shown in Fig. 4. For certain difficult loads, special sleds such as the ones shown in Figs. 5 and 6 are used. The floor construction of the C-46 is quite light, and for that reason most of these planes are equipped with "task force flooring". This "task force flooring" consists of panels of laminated construction. The panels are fastened to the floor of the plane and help to distribute the load properly. Heavy equipment should not be transported in a C-46 plane which is not so equipped. Even with this extra flooring, it is best to keep the loads within 500 pounds per running foot of sled. Where this figure is exceeded, it is advisable to place long boards under the sled runners to further distribute the load. Sled runners and boards should be greased to facilitate movement of the sleds.

g. The maximum permissible payload of a plane varies with the distance of flight, speed, altitude, amount of fuel, personnel, equipment carried, etc. To minimize these variables for the loadings presented in the appendices to this report, if is assumed that the oil tanks and wing fuel tanks will be filled; that there will be three crew members; and that each member will be allowed 50 pounds of baggage. The Air Transport Command was consulted for basic weight and basic arm data which will be reasonably standard for the majority of C-46 planes in service. These were given as 30,690 pounds and 330.75 inches, respectively, and result in a "less-cargo-weight" of 40,740 pounds and a "less-cargo-arm" of 326 inches. Data regarding the physical and loading characteristics of the C-46 plane follow:

(1) Physical Characteristics of C-46 Cargo Plane

Item	
Normal cargo load	8000 - 9000 pounds
Normal fuel	1400 gallons (8400 pounds)
Normal oil	120 gallons (900 pounds)
Normal crew	750 pounds *
Maximum weight at take-off	49000 pounds

Item	
Maximum landing weight	
Smooth runway	46000 pounds
Rough runway	44000 pounds
Cargo door	
Width	95½ inches
Height - front	79 inches
rear	79 inches
Maximum range	1500 miles
Approximate interior dimensions	
Maximum center height	83 inches
Width of floor (clear)	96 inches
Length	576 inches

* Includes 50 pounds baggage per man

(2) Loading Characteristics of C-46 Cargo Plane

Forward Safety Limit of cg	
MAC	20%
Station number	308
Aft safety limit of cg	
MAC	28.85%
Station number	323
Desired cg (gross load)	
MAC	34%
Station number	332

h. Various methods may be used to raise pieces of equipment from the ground into the plane. Again the Quickway Crane or truck boom mentioned in paragraph 5 may be employed. The item to be loaded is held in the air close to the door of the plane, and is swung into the plane by man power or by the use of tackle rigged inside the plane. In the absence of such powered equipment, shears may be used, and are probably better for the larger and heavier pieces. The shears (Fig. 1) should be constructed of 16-inch round timbers about 35 feet long. Two sets of tackle should be used on the shears and each should be reeved with triple blocks. The fall lines should be run through single blocks lashed to the foot of the legs, and the pull made with a 1/4-ton truck, small tractor, or other powered vehicle. The shears should be set in holes 17 feet 6 inches apart (inside to inside) and on a line 3 feet from the plane. They should be guyed with tackle fore and aft

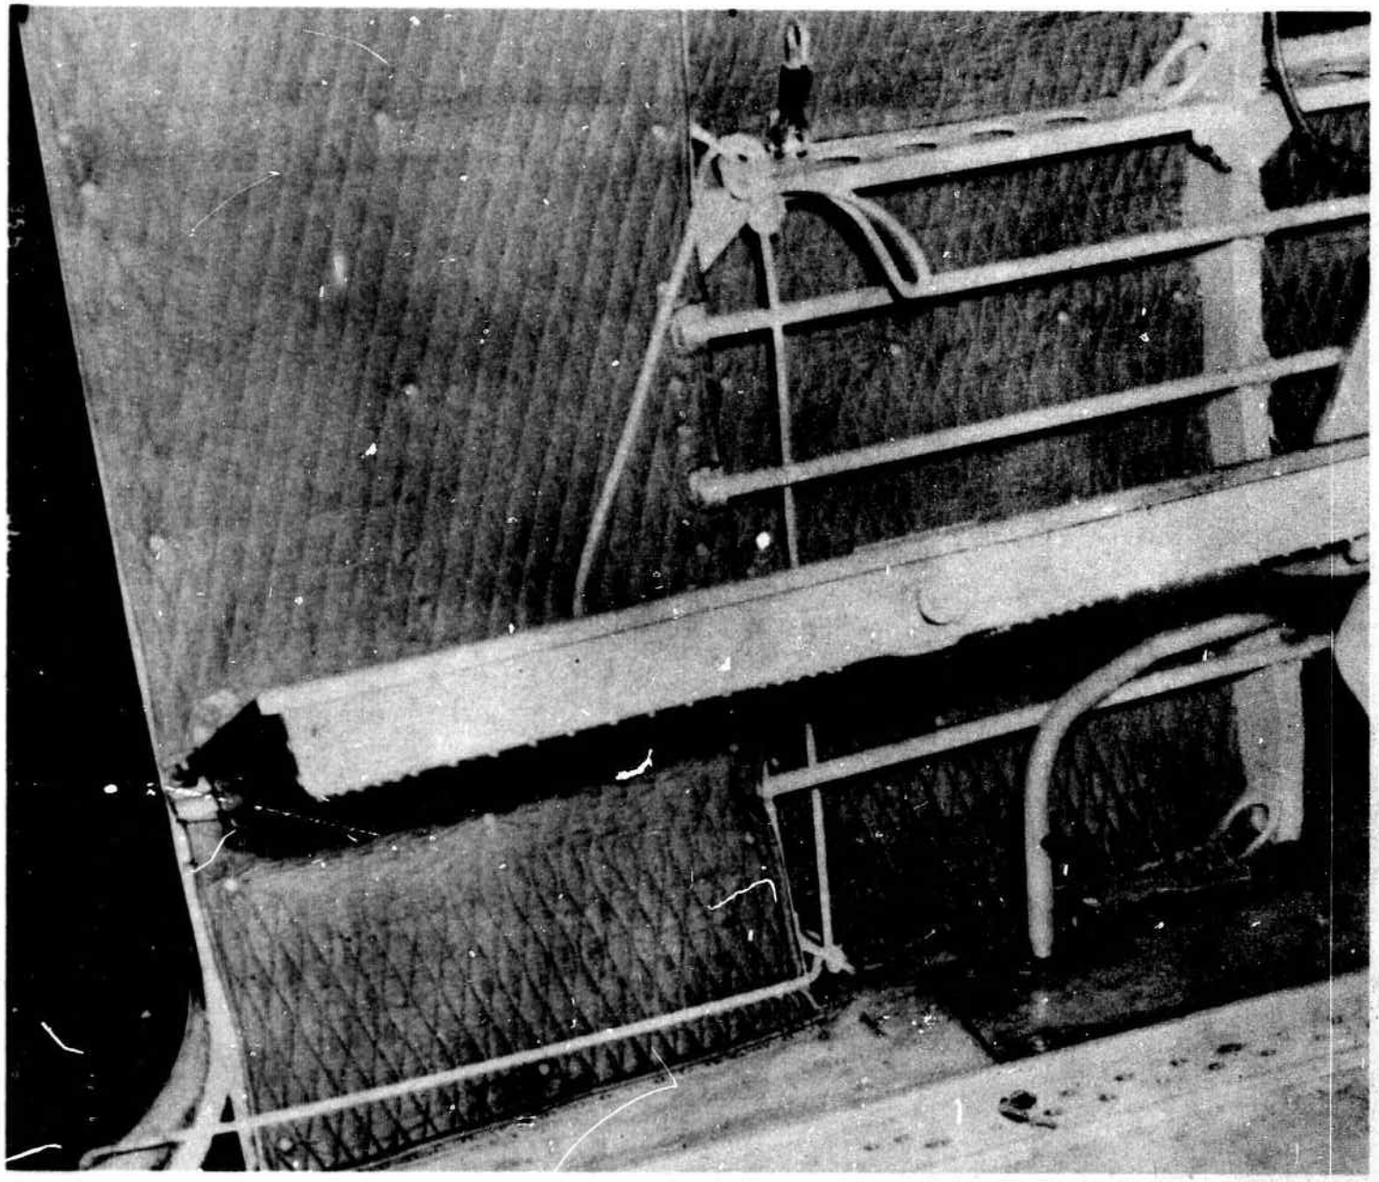

FIG. 14. ALTERNATE METHOD OF FASTENING ONE REAR GUY LINE

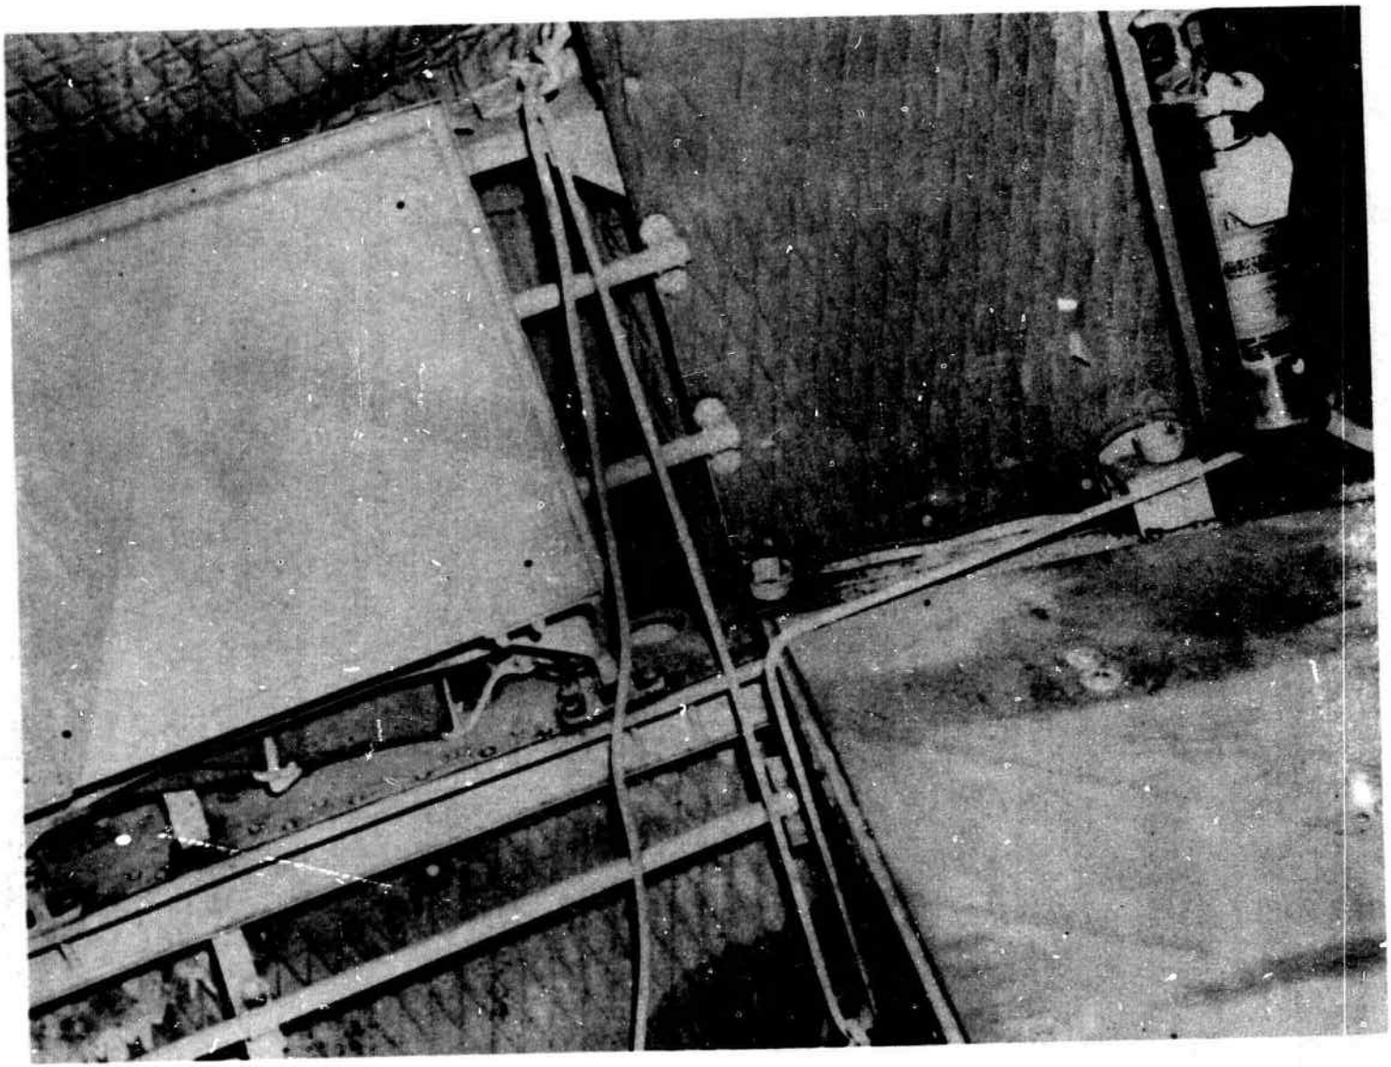

FIG. 15. ALTERNATE METHOD OF FASTENING SECOND REAR GUY LINE

so that they may be readily tilted when loading heavy assemblies through the plane door. The tackle inside the plane may be fastened to the snatch-block ring opposite the door, which is also used for pulling equipment into the plane when ramps are used (Fig. 4). Loads may be pulled forward in the loading compartment by use of the holdfast shown in Fig. 4. Heavy loads may be pulled forward in the plane much more readily if heavy grease is applied to the floor area on which they slide.

i. Fig. 1 shows a typical load being placed in a mock-up of a C-46 Cargo Plane by use of shears as described above.

j. Equipment used for loading as suggested above includes:

(1) Shears:

(a) 2 16-inch x 35-foot Timbers
(b) 4 6-inch Triple Blocks
(c) 4 6-inch Double Blocks
(d) 2 6-inch Single or Snatch Blocks
(e) 500 feet of 1-inch Rope
(f) 400 feet of 3/4-inch Rope

(2) Tackle inside plane:

(a) 4 6-inch Double Blocks
(b) 250 feet of 3/4-inch Rope

(3) Pull inside plane:

(a) 1 3 x 12 x 64-inch Lumber
(b) 1 $\frac{1}{2}$ x 6 x 6 x 12-inch Angle Iron
(c) 3 3/4 x 4-inch Cap Screws

(4) Miscellaneous slings and lashings:

(a) 100 feet of 5/8-inch Cable
(b) 50 feet of 3/4-inch Cable
(c) 24 5/8-inch Cable Clamps
(d) 12 3/4-inch Cable Clamps
(e) 200 feet of 1-inch Rope

k. Extremely long items such as the frame of a truck should be loaded with the forward end on one sled and the aft end on another. For moving the sleds forward, a piece of cable may be anchored to the front two tie-down points, as shown in Fig. 4, and tackle fastened between this fitting and the sled to be moved.

1. The following steps should be followed to raise the cargo doors to permit loading with shears:

(1) Using $\frac{1}{2}$-inch diameter manila rope or its equivalent, attach two pieces, each approximately 50 feet long, to the forward lock of the forward door, and two pieces, each approximately 50 feet long, to the aft lock of the aft door. (See Fig. 7.) Throw one rope from each door over the fuselage and allow the other to drop to the ground.

(2) Remove the cargo door struts from both doors by removing the extreme bolts. (See Fig. 8.) Caution: These struts are heavily spring-loaded and will extend when released. Damage to equipment or personnel is possible unless the struts are handled with care.

(3) In the fully extended and locked position, the struts may be used to raise the door to a position where the ropes can become effective. (See Fig. 9.) Care must be taken when raising the door to prevent damage to the hinges by allowing the door to swing too far open.

(4) When the door is raised, the four ropes should be securely tied down to the ground. (See Figs. 10 and 11.)

(5) An alternate method of holding the doors in an upright position is to pass the back ropes completely under the fuselage, bring them into the cargo compartment, and tie them down to cargo tie-down rings. (See Figs. 12 through 15.) This alternate method still requires external tying-down of the ropes on the cargo door side.

IV. DISCUSSION

7. General.

a. The problem involved was one of breaking down standard Engineer equipment into sub-assemblies that would be within the size and weight limitations of the C-46 cargo plane for transport into otherwise inaccessible areas. It was assumed that for initial preparation of landing strips the light Airborne Engineer Aviation equipment would be used, but that as soon as possible standard equipment would be flown in to develop the strips for use by all types of combat aircraft, and for general maintenance.

b. The problem was worked out on the premise that preparation for air transport would be performed by units using, wherever possible, only the equipment and tools available within the organizations. The simplest methods were used throughout, on the assumption that units not highly trained in such a transportation procedure may be suddenly called upon to perform airborne missions. Certain pieces of equipment listed herein are applicable not only to Aviation Engineer units, but also to units similarly equipped, such as Combat Engineer and General Service units. The loading principles stated apply in general to any type of equipment to be transported by air in this type of plane.

c. It should be noted that the information presented on plane weight characteristics and load position included in the appendices, is sample data only; local conditions as to load limits, condition of runways, plane characteristics, and other variables will modify the data accordingly.

8. Source of Information. Every available source of information was utilized in the study of the problem. Commercial Airlines, the Air Transport Command of the Army Air Forces, and the Curtiss-Wright Corporation were called upon for information concerning airplane loading and flight characteristics. Individual members of these organizations proved exceedingly cooperative. Full use was made of data published by the Army Air Forces. The advice of manufacturers of the various items of Engineer equipment was sought prior to breakdown of individual items.

V. CONCLUSIONS

9. Conclusions. It is concluded that:

a. For almost every piece of construction equipment standard in the Aviation Engineer Battalion the problem of air transport in the C-46 plane is feasible. The time involved in preparation both before and after the trip by air is relatively short. Methods required are simple, and allow any unit to transport its equipment by air with little or no prior training, provided it is furnished an instructional guide.

b. All items of equipment considered may be transported in the C-46, with the exception of the standard model LS Scraper, as the scraper bowl is too large to enter the plane. The scraper may be converted by the using unit to the airborne model, if sufficient time is allowed, by following the instructions in Engineer Board Report 814 Disassembly and Loading of the LeTourneau Model LS Carryall Scraper for Air Transport in the C-47 Cargo Plane, dated 12 May 1944.

c. In addition to the equipment items considered herein, many other standard Engineer items of equipment can be loaded.

VI. RECOMMENDATIONS

10. Recommendations. It is recommended that in any equipment list for a unit transporting its equipment by air, provision should be made for the airborne model of the bituminous distributor, and for the factory-supplied conversion kits for the 2½-ton dump truck.

APPENDIX A

DIRECTIVE

WAR DEPARTMENT
OFFICE OF THE CHIEF OF ENGINEERS
WASHINGTON

CE(20 Apr 44)
SPENE
400.1 (GNS 355)

20 April 1944

Subject: Air Transport of Standard Engineer Equipment
(Work Order No. DME 3388)

To: The President
The Engineer Board,
FORT BELVOIR, VIRGINIA.

1. In Work Order No. DME 3025 dated 14 September 1943, and supplement No. 1 thereto, dated 1 October 1943, there was established the initial list of fourteen (14) items of equipment and five (5) types of aircraft to be considered in the study of disassembly, loading, unloading and reassembly of engineer equipment for transport by air. In compliance with various subsequent requests, additional items have been authorized in Work Orders No. DME 3167 dated 9 December 1943, DME 3183 dated 18 December 1943, DME 3275 dated 16 February 1944, DME 3336 dated 23 March 1944 and DME 3667 dated 13 April 1944, to the extent that the current list contains twenty (20) items of equipment and six (6) types of aircraft as follows:

a. Equipment

(1) Tractor, Crawler Type, Diesel, W/Angledozer, 80 DBHP Caterpillar, Model D-7.

(2) Scraper, Self-Loading, Towed Type, Cable Operating, 8 Cu. Yd. (Struck) LeTourneau Model LS.

(3) Grader, Road, Motorized, Diesel Engine Driven, 12 Ft. Moldboard, Caterpillar Model 12.

(4) Crane, Tractor Operated, Non-revolving, 40,000 Pound Capacity at 10 Foot Radius 20 Foot Boom, LeTourneau Model M-20.

(5) Crane, Truck Mounted, Gasoline Driven, 3/8 Cu. Yd., Quickway Model E.

(6) Truck, Dump, 2-1/2 Ton, 6x6.

(7) Grader, Road, Towed, Leaning Wheel, Hand Controlled, 12 Foot Moldboard, Adams Model 124-S.

(8) Roller, Road, Towed Type Sheepsfoot, Two-Drum-in-Line, LeTourneau Model W-2.

(9) Compressor, Air, Trailer Mounted, Steel Wheels, Diesel Engine Driven, 315 C.F.M., Ingersoll-Rand, Model No. 1K-315.

(10) Roller, Road, Towed Type Wheeled Rubber Tired, 13 Tires, Wm. Bros. Model 67W.

(11) Roller, Road, Gasoline, 3-Wheel, 10 Ton, Galion Model "Chief".

(12) Roller, Road, Powered, Gasoline, 2 Axle Tandem, 5-8 Ton, Buffalo Springfield, Model KT16.

(13) Distributor, Bituminous Material, Trailer Mounted, 1250 Gallon, Etnyre Model MX, Style RE.

(14) Tractor, Crawler Type, Diesel, W/Angledozer, 113 DBHP, Caterpillar Model D-8.

(15) Tractor, Crawler Type, Diesel, W/Angledozer, 55 DBHP, Caterpillar Model D-6.

(16) Truck, Fire, Powered, Crash, Class-135 Complete W/Equipment.

(17) Crushing and Screening Plant, Gravel and Rock, 2 Units, Gasoline Engine Driven, Semi-trailer Mounted, with Dollies, 25 Cu. Yd. Per Hour, Iowa Mfg. Co., Model 25 Cu.Yd.

(18) Tractor, Crawler Type, Diesel Engine Driven, 35-40 DBHP, Rigid, Complete with Loader Bucket, Cable Operated, Front Mounted, 3/4 Cu. Yd., and Dozer Attachment, Caterpillar Model D-4, 60" Gage, Trackson Trax-cavator Model T-4, and Trackson Dozer Attachment. (Note: Non-Standard Attachments).

(19) Grader, Road, Motorized, Diesel Engine Driven, 12-Ft. Moldboard, Galion Model 101-D.

(20) Grader, Road, Motorized, Diesel Engine Driven, 12-Ft. Moldboard, Adams Model 512.

b. Types of Aircraft.

(1) C-47
(2) C-54
(3) C-46
(4) C-87
(5) CG-13
(6) C-82

2. In view of the urgent need that information resulting from the study be made available for distribution, and in view of the probability of further expansion of the study, it becomes necessary that reports be prepared on the basis of the presently authorized list detailed in the preceding paragraph, and that the publication of these reports shall not be delayed by reason of consideration of items other than those now authorized.

3. Therefore, the Engineer Board is directed to:

a. Prepare and publish an addendum to the report "Disassembly and Loading of Standard Engineer Equipment for Transport in the C-47 Cargo Plane" (dated 24 January 1944) which will include the results of study of each of those items of equipment listed in paragraph 1a above, not covered by the original report.

b. Prepare and publish reports, similar in form to the report "Disassembly and Loading of Standard Engineer Equipment for Transport in the C-47 Cargo Plane" (dated 24 January 1944) covering each of the following types of aircraft: C-54, C-46, C-87, CG-13 and C-82. Each of these reports will include the results of the study of each of the items of equipment listed in paragraph 1a above, for transport in the subject types of aircraft.

c. Publish the reports and the addendum specified in the preceding sub-paragraphs at the earliest possible date without hindrance or delay due to inclusion therein of items other than those presently authorized and listed under paragraph 1 above.

4. It is requested that one hundred and fifty (150) copies of each of the reports and of the addendum required under the preceding paragraph, be furnished this office for distribution.

5. In a memo to the Chief, Training Branch, War Plans Division dated 11 February 1944, subject "Technical Bulletin on Disassembly and Loading of Standard Engineer Equipment for Transport in the C-47 Cargo Plane", this office requested that a Technical Bulletin be prepared by the Engineer School from data contained in the subject report and published in quantity, for wide distribution, and also requested that the Engineer School contact the Engineer

Board directly on all matters in connection therewith. Similar arrangements have since been made for Technical Bulletins to be prepared from data contained in the reports and addendum to be prepared in accordance with paragraph 3 above.

By order of the Chief of Engineers:

/s/William J. New
/t/WILLIAM J. NEW,
Lt. Col., Corps of Engineers,
Chief, Equipment Development Branch,
Engineering and Development Division.

APPENDIX B

DISASSEMBLY, GROUPINGS, AND LOADING OF THE TRACTOR, CRAWLER TYPE, DIESEL-ENGINE-DRIVEN, 35-40 DBHP, 44-INCH GAUGE, CATERPILLAR MODEL D-4, WITH ANGLE-DOZER, LETOURNEAU CK 4, AND POWER CONTROL UNIT, LETOURNEAU T4

1. General. The total weight of the Caterpillar D-4 is 15,987 pounds. It requires two C-46 cargo planes for transportation.

2. Dismantling. Following are the only pieces which need be removed from the D-4 in order to load it:

(1) Dozer blade
(2) Yoke and sheave
(3) Rear "A" frame
(4) Front "A" frame
(5) Box beam
(6) Two tracks
(7) Two track roller frame assembly and covers
(8) Two track roller frame assemblies.

3. Loading. A special sled should be constructed for load No. 1. This piece weighs 8,365 pounds, and must be carefully handled while loading. The runners for the sled must be at least nine feet long, and it is recommended that the runners be equipped with a metal cover order to facilitate moving the load forward into its proper position. Metal tracks on the plane floor will also help reduce the sliding friction of this load. Plenty of heavy grease must be used under the runners while pulling the sled forward.

4. Man-Hours. A crew of six men worked the following hours:

Dismantling	2 men	8 mh
Loading	4 men	28 mh
Unloading	4 men	22 mh
Reassembly	2 men	9 mh
Total		67 mh

PLATE NO. 2

Item	Weight
Blade	1180
Yoke and sheave	950
Rear "A" frame	345
Front "A" frame	430
Box beam	77
Two tracks	2120
Two track roller frame assembly end covers	20
Two track roller frame assemblies	2520
Total	7622

Loading	Unloading
4 men - 16.00 man-hours	4 men - 12.00 man-hours

APPENDIX C

DISASSEMBLY, GROUPINGS, AND LOADING OF THE TRACTOR, CRAWLER TYPE, DIESEL-ENGINE-DRIVEN, 55 DBHP, CATERPILLAR MODEL D-6, WITH TRAILBUILDER, LAPLANT-CHOATE R-61, AND POWER CONTROL UNIT, LETOURNEAU R678

1. General. Total weight of the D-6 Caterpillar tractor is 24,565 pounds, and it requires three C-46 cargo planes for transportation.

2. Dismantling. In disassembling the D-6, use the following sequence:

(1) Blade and yoke as one unit
  (a) Separate blade from yoke
(2) Break and lay out tracks
(3) Engine hood
(4) Bleed hydraulic system
(5) Blade lift mechanism
(6) Radiator guard plates
(7) Radiator screen
(8) Radiator
(9) Crankcase guard plates
(10) Hydraulic lines (2)
(11) Floor boards and dash board side plates (7 pieces)
(12) Remove, as one unit, seat frame, fuel tank, running boards, lights, tool box, and hydraulic oil tank and valve.
(13) Track roller frame guards (2)
(14) Power control unit
(15) Track roller frame assemblies (2)
(16) Tracks

3. Loading. A sled at least 9½ feet long is necessary to distribute properly the 8,775 pound weight of the engine and frame group. Reduce friction by metal facing the sled runners and greasing the plane floor. The yoke must be loaded, as shown in Fig. 20, by passing one yoke leg through the door toward the rear of the plane and then by bringing the second yoke leg into the plane by pulling the yoke forward into loaded position.

4. Man-Hours. A crew of 7 men worked the following periods:

Disassembly	3 men	24 mh
Loading	4 men	26 mh
Unloading	4 men	20 mh
Reassembly	3 men	30 mh
Total		100 mh

Approximate total time in preparation of equipment for flight is 9 hours and for operation after landing is 11 hours.

APPENDIX D

DISASSEMBLY, GROUPINGS, AND LOADING OF THE TRACTOR, CRAWLER TYPE, DIESEL-ENGINE-DRIVEN, 80 DBHP, CATERPILLAR MODEL D-7, WITH ANGLEDOZER, LETOURNEAU WCK7, AND POWER CONTROL UNIT, R 7

1. General. The total weight of the D-7 Tractor is 33,015 pounds, and it requires four C-46 cargo planes for transportation.

2. Dismantling. Since the engine and transmission can be loaded as a unit, and need not be dismantled, there were no difficulties encountered in disassembling the tractor in the following sequence:

(1) Blade and side arms
(2) Yoke
(3) "C" frame
(4) Rear "A" frame and ridge beam
(5) Front power control unit
(6) Crankcase guard plates
(7) Hood and side panels
(8) Radiator and guards
(9) Air Filters
(10) Starting engine
(11) Track roller frame guard plates
(12) Tracks (break and lay out)
(13) Rear power control unit
(14) Track roller frame assemblies
(15) Drawbar group
(16) Final drive housing and sprockets

3. Loading. The yoke of the angledozer is too large to load as one piece and must be cut in two (See Fig. 37). By cutting the yoke 20 inches from the center line as shown, the cut will miss both the external and internal reinforcing bars.

The loading of the engine-transmission group is shown in Figs. 27 and 28. The minimum length of the sled for this group is 10 feet.

4. Man-Hours. A crew of four men worked the following hours:

Cutting yoke	1 man	½ mh
Dismantling	2 men	56 mh
Loading	4 men	36 mh
Unloading	4 men	32 mh
Reassembly	2 men	54 mh
Welding yoke	2 men	4 mh
Total		182½ mh

APPENDIX E

DISASSEMBLY, GROUPINGS, AND LOADING OF THE TRACTOR, CRAWLER TYPE, DIESEL-ENGINE-DRIVEN, 113 DBHP, CATERPILLAR MODEL D-8 WITH ANGLE-DOZER, LETOURNEAU CKD 8, AND POWER CONTROL UNIT, R8

1. General. The total weight of the D8 is 42,048 pounds, and requires five C-46 cargo planes for transportation.

2. Dismantling. In order to load the dozer yoke it must first be cut in two pieces. Figs. 41 and 52 show the cut and subsequent weld, and Fig. 52 gives the detailed dimensions and location for the cut and weld. Following is the proper sequence of disassembly:

(1) Cables
(2) Radiator
(3) Yoke
(4) Ridge beam
(5) Front "A" frame
(6) Front winch guard support
(7) Rear "A" frame
(8) Hood
(9) Seat and fuel tank
(10) Power control unit
(11) Running boards
(12) Tracks
(13) Belly pan
(14) Radiator and support arms
(15) Clutch assembly
(16) Engine assembly
(17) Exhaust and oil cleaner extension
(18) Instrument panel
(19) Track roller frame assemblies
(20) Equalizer spring assembly
(21) Frames
(22) Sprocket covers
(23) Drawbar assembly
(24) Control levers

3. Loading. Two pieces of the D8 will require special sleds, the engine group, and the transmission group. The sled for the engine must be at least six feet long, and the sled for the transmission at least nine feet long for proper weight distribution. Fig. 39 shows the transmission mounted on a specially designed sled and fastened to it by means of strap iron anchors. As in loading any other heavy pieces, these two groups will have to be handled carefully. The transmission is especially heavy, 8373 pounds, and it is recommended that metal runners be used on the sled and metal tracks on the plane floor, lubricated with plenty of heavy grease, in order to facilitate pulling the sled forward into position. Figs. 39 and 40 show the transmission being loaded.

4. Man-Hours. A crew of eight men worked the following hours:

Dismantling	4 men	77 mh
Loading	4 men	68 mh
Unloading	4 men	56 mh
Reassembly	4 men	78 mh
Total		279 mh

APPENDIX F

DISASSEMBLY, GROUPINGS, AND LOADING OF THE GRADER, ROAD, MOTORIZED, DIESEL-ENGINE-DRIVEN, 12-FOOT MOLDBOARD, CATERPILLAR MODEL 12

1. General. The Caterpillar No. 12 motor grader weighs 23,280 pounds, and requires three C-46 cargo planes for transportation.

2. Dismantling. A convenient sequence for disassembly follows:

(1) Moldboard, circle and blade assembly
(2) Scarifier and scarifier drawbars
(3) Scarifier gear box and arms
(4) Hood, hood door groups (2), and air cleaner
(5) Engine
(6) Cab floor boards
(7) Transfer case, differential, tandem drive group w/4 wheels
(8) Remove wheels from tandem drive group (See 7 above)
(9) Front steering mechanism, wheels and leaning wheel control box
(10) Lenaing wheel control bar
(11) Starting engine gas tank
(12) Control handles and back of seat

3. Loading. The frame must be loaded cab end first, as shown in Fig. 53. The engine should be bolted to its sled before loading. A standard sled is used at the front end.

4. Man-Hours. A crew of eight men worked the following periods:

Disassembly	4 men	30 mh
Loading	4 men	24 mh
Unloading	4 men	24 mh
Reassembly	4 men	32 mh
Total		110 mh

Eight men can prepare the grader for flight in approximately 12 hours. It will require about the same time for a similar crew to put the machine in operation after the landing.

APPENDIX G

THE DISASSEMBLY, GROUPINGS, AND LOADING OF THE GRADER, ROAD, MOTORIZED, DIESEL-ENGINE-DRIVEN, 12-FOOT MOLDBOARD, GALION MODEL 101-D

1. General. The Galion Model 101-D motor grader weighs approximately 22,500 pounds, and requires two and two thirds C-46 planes for transportation.

2. Dismantling. Following is the proper sequence for disassembly:

(1) Cab
(2) Moldboard
(3) Drain and disconnect hydraulic system at control manifold and pump
(4) Circle
(5) Scarifier
(6) Scarifier hang rods and lift shafts
(7) Front wheel assembly
(8) Engine
(9) Remove rear wheels from tandem
(10) Cut frame behing dashboard (See Figs. 60 and 67)

In reassembly the leaning wheel control rod, inner half, is inserted behind the king pin before mounting the front wheels. Except for this, reassembly is accomplished by reversing the above sequence. The frame is welded as shown in the sketch, Fig. 67.

3. Loading. The front part of the frame is the most difficult piece to load. Fig. 59 shows this assembly going through the door. Standard sleds are used under each end.

Since the cab is not taken along on an airborne mission, no provision is made for it in the load groupings.

4. Man-Hours. A nine-man crew worked the following periods:

Disassembly	4 men	28 mh
Cutting	1 man	½ mh
Loading	4 men	16 mh
Unloading	4 men	12 mh
Welding	1 man	2 mh
Reassembly	4 men	28 mh
Total		86½ mh

Approximate Total time in preparation of equipment:

For flight	9 men	10 hrs
For operation	9 men	9 hrs

APPENDIX H

THE DISASSEMBLY, GROUPINGS, AND LOADING OF THE GRADER, ROAD, MOTORIZED, DIESEL-ENGINE-DRIVEN, 12-FOOT MOLDBOARD, ADAMS MODEL 512

1. General. Total weight of the Adams 512 motor grader, as prepared for air transport, is approximately 24,410 pounds, and requires three C-46 cargo planes for transportation.

2. Dismantling. There are no difficulties in disassembly or reassembly. Proper sequence for disassembly is:

(1) Scarifier
(2) Moldboard
(3) Circle assembly
(4) Fuel tank
(5) Tool box and battery box
(6) Disconnect all universals at control boxes
(7) Remove all control rods from frame
(8) Cab
(9) Remove cross member from rear end of frame
(10) Block up frame and roll out tandem, transmission and engine as one unit.

(a) Remove engine
(b) Remove tandems (drain oil)

(11) Front wheel assembly
(12) Remove all gear boxes

3. Loading. The frame, which requires a special sled (See Fig. 5), is loaded rear end first, as shown in Fig. 68. Note that the frame is mounted upside down on the sled.

In loading the engine, the exhaust pipe must be removed before the assembly will pass through the door. To facilitate lifting this assembly into the plane, "eyes" as shown in the sketch, Fig. 76, should be attached.

4. Man-Hours. A crew of eight men worked the following periods:

Disassembly	3 men	30 mh
Loading	4 men	30 mh
Unloading	4 men	24 mh
Reassembly	4 men	48 mh
Total		132 mh

Approximate total time in preparation of equipment:

For Flight	7 men	11 hours
For Operation after Landing	8 men	13 hours

APPENDIX I

THE DISASSEMBLY, GROUPINGS, AND LOADING OF THE GRADER, ROAD, TOWED, LEANING WHEEL, HAND CONTROLLED, 12-FOOT MOLDBOARD, ADAMS MODEL NO. 124-S

1. General. The Adams 124-S road, towed grader weighs approximately 12,000 pounds and requires one and one-half C-46 cargo planes for transporation.

2. Dismantling. There are no disassembly difficulties; use the following sequence:

(1) Scarifier assembly
(2) Disconnect blade lift arms from drawbar links
(3) Blade lift spring assembly
(4) Circle, moldboard and blade assembly
(5) Operating hand wheels (3)
(6) Front wheel and tongue assembly
(7) Operator's platform
(8) Rear wheel group

3. Loading. There are no particular loading problems. Fig. 77 shows the manner in which the frame is loaded.

4. Man-Hours. A crew of eight men worked the following periods:

Disassembly	4 men	6 mh
Loading	4 men	10 mh
Unloading	4 men	7 mh
Reassembly	4 men	8 mh
Total		31 mh

Approximate total time in preparation of equipment:

For Flight -	8 men	3 hours
For operation -	8 men	3 hours

DISASSEMBLY, GROUPINGS, AND LOADING OF THE CRANE, TRACTOR-OPERATED, NON-REVOLVING, 40,000-POUND CAPACITY AT 10-FOOT RADIUS, 20-FOOT BOOM, LETOURNEAU MODEL M-20

1. General. The LeTourneau 20-ton tractor crane weighs 7,730 pounds and requires one C-46 cargo plane for transportation.

2. Dismantling. The crane is prepared for loading in the following manner:

(1) Rewind all cable on tractor drums
(2) Remove left and right boom members and center spacer
(3) Remove head structure and balance beam
(4) Remove wheels
(5) Disconnect tongue from tractor

3. Loading. There are no loading difficulties. Each assembly loads into the plane in a straightforward manner.

4. Man-Hours. A crew of seven men worked the following periods:

Disassembly	3 men	6 mh
Loading	4 men	6 mh
Unloading	4 men	6 mh
Reassembly	3 men	4 mh
Total		22 mh

Seven men can prepare the crane for flight in about three hours. It will take approximately the same time to put the crane in operating order after the landing.

APPENDIX K

DISASSEMBLY, GROUPINGS, AND LOADING OF THE CRANE, TRUCK-MOUNTED ON COLEMAN CHASSIS, GASOLINE-ENGINE-DRIVEN, 3/8 CU YD, QUICKWAY CONVERTIBLE UNIT MODEL E, WITH CRANE, DRAGLINE, SHOVEL, PILEDRIVER, AND CLAMSHELL ATTACHMENTS

1. General. Total weight of the Coleman truck and Quickway convertible unit is approximately 33,000 pounds, and requires four C-46 planes for transportation. The trailer for the Quickway attachments was not included, since its value in an airborne mission would not warrent the difficulties of transporting it.

2. Dismantling. Since the crane is used in dismantling the truck, the Quickway is not disassembled until the Coleman is stripped down to the chassis. Support the rear end of the truck frame firmly with jacks to prevent tipping.

a. Here is the proper disassembly sequence for the Coleman truck:

(1) Drain radiator
(2) Hood and side panels
(3) Engine cover
(4) Fenders
(5) Spare tire and bracket
(6) Boom rack and radiator guard
(7) Disconnect lines and wiring to cab at junction boxes located on the frame. Do not remove the intricate wiring from the instrument panel. The cranking engine wire that runs from the 12 volt magnetic switch is disconnected at the engine itself. Battery leads are not disconnected since the battery box is an integral part of the frame.
(8) Gas tank
(9) Cab
(10) Radiator
(11) Control rods to front winch, high and low ratio, and auxilliary transmission. Only the pedal is removed from the D valve.
(12) Propeller shafts
(13) Engine
(14) Steering wheel and gear
(At this point the Quickway is dismantled. See Par. b)
(15) Front wheel group
(16) Rear wheel group
(17) Rear bumper

Air lines, front winch assembly, front bumper, and transfer case are not removed from the frame. Tape or tie air lines securely.

b. Use this sequence for dismantling the Quickway:

(1) Crane hook assembly
(2) Crane boom
(3) Cab panels
(4) Disconnect hydraulic and electrical lines
(5) Engine
(6) Gantry frame
(7) Control cabinet

(8) Scarf tack welds between hoisting unit and structural frame of Quickway platform
(9) Hoisting unit
(10) Cab platform, seat, and foot pedals

3. Loading. There are no special loading difficulties. The truck frame is loaded flat, as shown in Fig. 84. When a loading pump is used, the front end of the frame may be rolled up the ramp on the front bumper roller.

4. Man-Hours. A crew of eight men worked the following periods:

		Quickway	Coleman
Disassembly	4 men	20 mh	16 mh
Loading	4 men	18 mh	17½ mh
Unloading	4 men	12½ mh	13 mh
Reassembly	4 men	24 mh	28 mh
Totals		74½ mh	76½ mh

It will take an 8-man crew approximately 16 hours to dismantle and load this equipment, and about 19 hours to unload and reassemble it.

APPENDIX L

DISASSEMBLY, GROUPINGS, AND LOADING OF THE BROCKWAY TRUCK CHASSIS (MAY BE USED IN PLACE OF THE COLEMAN TRUCK CHASSIS AS A MOUNT FOR THE QUICKWAY CRANE)

1. General. The total weight of the Brockway Truck is 20,805 pounds, and it requires two and one half C-46 cargo planes for transportation.

2. Dismantling. Much time can be saved in reassembly if adequate precautions are taken during disassembly. It is not necessary to remove the intricate wiring from the instrument panel of the truck. These leads may be disconnected at junctions boxes located on the frame.

Care should be taken to prevent dirt from fouling the fitting, valves, and air lines of the compressed air system. Tagging the air lines will expedite reassembly.

It can not be over emphasized that it is extremely easy to lose or damage the many parts on this truck, and the loss of just one part may deadline the truck during the time when it is most critically needed.

Following is a convenient sequence of disassembly:

(1) Boom rest frame
(2) Winch drive with universal
(3) Front winch assembly
(4) Front winch support
(5) Quickway crane unbolted and removed
(6) Upper and lower support tables for crane
(7) Rear bumpers
(8) Spare tire and carrier assembly
(9) Fuel tank guard panel
(10) Hood and two side panels
(11) Radiator shelf and guard
(12) Air cleaner
(13) Left fender and running board
(14) Right fender and running board with batteries (2)
(15) Floor boards
(16) Fuel tanks and fuel lines
(17) Disconnect wires and air lines
(18) Steering assembly
(19) Cab
(20) Radiator
(21) Operating levers, foot and clutch pedals
(22) Hand brake assembly
(23) Air tanks and air lines
(24) Muffler and exhaust pipe
(25) Emergency brake assembly
(26) Universal joints and drive shafts
(27) Transfer case
(28) Engine
(29) Two rear wheel assemblies
(30) Front bumper
(31) Front wheel assembly

3. Loading. The only piece which will offer loading idfficulty is the truck frame. The easiest method found is to load it lying on its side. By placing the front end inside the door on a standard sled, and suspending the rear end with the shears or quickway crane, it will slide forward all the way into the plane. After the rear end clears the door the frame should be laid flat, with a second sled under the rear end, and then pulled into position.

4. Man-Hours. A crew of eight men worked the following hours:

Dismantling	4 men	72 mh
Loading	4 men	44 mh
Unloading	4 men	44 mh
Reassembly	4 men	72 mh
Total		232 mh

APPENDIX M

DISASSEMBLY, GROUPINGS, AND LOADING OF THE ROLLER, ROAD, TOWED, SHEEPSFOOT, 2-DRUM-IN-LINE, LETOURNEAU TYPE S, MODEL W2 OR W3

1. General. The total weight of the Sheepsfoot Roller is 6400 pounds, and it requires approximately three-fourths of the payload of one C-46 cargo plane. When additional cargo is included to complete the full payload, it must be located so that the resultant cg of the whole plane is between Stations 308 and 325.

2. Dismantling. For convenient loading only the tongue need be removed, and the two sections separated. Both drums should be emptied.

3. Loading. Each section must be loaded on a standard type sled.

4. Man-Hours. A crew of six men worked the following hours:

Dismantling	2 men	1 mh
Loading	4 men	12 mh
Unloading	4 men	12 mh
Reassembly	2 men	1 mh
Total		26 mh

APPENDIX N

DISASSEMBLY, GROUPINGS, AND LOADING OF THE ROLLER, ROAD, TOWED, WHEELED, RUBBER-TIRED, 13 TIRES, WILLIAM BROS MODEL 67-W "WOBBLE WHEEL"

1. General. The total weight of the Wobble-Wheel Roller is 3510 pounds, and it requires one third the payload of one C-46 cargo plane for transportation.

2. Dismantling. In order to load the roller, the front wheel assembly with the bolster and drawbar must be removed, and the roller body must be cut. Figs. 106, 107, 108 and 109 show pictures of the cut and subsequent weld. Fig. 112 shows the detailed dimensions of the cut and weld. It is not necessary to remove the rear wheels for the cut, however, care should be taken to protect the rubber from the molten metal.

For reassembly, the following procedure is recommended:

(1) Turn the two sections of the body upside down and carefully align them.

(2) Tack them together all along the cut at 6 inch intervals.

(3) Weld in place the seven outside straps.

(4) Turn the two sections over, and weld the three inside straps in place.

(5) Complete by welding the entire cut inside and out.

3. Loading. No difficulty is encountered in loading.

4.- Man-Hours. A crew of six men worked the following hours:

Dismantling	2 men	1 mh
Cutting	1 man	1 mh
Loading	3 men	7½ mh
Unloading	3 men	4½ mh
Welding	1 man	4 mh
Reassembly	2 men	1 mh

APPENDIX O

DISASSEMBLY, GROUPINGS, AND LOADING OF THE ROLLER, ROAD, GASOLINE-POWERED, 3-WHEEL, 10-TON, GALION MODEL "CHIEF"

1. General. The total weight of the Galion Roller is 19935 pounds, and it requires two and one half C-46 cargo planes for transportation.

2. Dismantling. Only the following pieces must be removed for loading:

(1) Cab
(2) Front roller and yoke
(3) Rear gear covers (4)
(4) Rear scraper bars (4)
(5) Rear wheels and ring gear

3. Loading. In handling load No. 1, great care must be used, because the unit is bulky and very heavy (8265 pounds). The great weight of this item makes it difficult to pull forward into position after it has cleared the door. Therefore, it is recommended that the sled runners be plated with metal and that a metal track be laid on the plane floor for the sled. In addition, plenty of grease must be used under the runners. The sled for this load must be at least nine feet long in order to comply with floor loading limits. Figs. 113 and 114 show this heavy piece loaded.

Load number three which consists of the two rear wheels weighing a total of 7390 pounds must be loaded on a sled at least 10 feet long in order to distribute the weight properly. As shown in the mock-up load, Fig. 120, the two wheels are loaded one on top of the other. This method was preferred to loading them one at a time on separate sleds because it resulted in a considerable saving of time in loading and unloading.

4. Man-Hours. A crew of six men worked the following hours:

Dismantling	2 men	8 mh
Loading	4 men	31 mh
Unloading	4 men	30 mh
Reassembly	2 men	8 mh
Total		77 mh

APPENDIX P

DISASSEMBLY, GROUPINGS, AND LOADING OF THE ROLLER, ROAD, POWERED, GASOLINE, 2 AXLE TANDEM, 5 TO 8-TON BUFFALO SPRINGFIELD MODEL KT-16

1. General. The total weight of the Buffalo Springfield Roller is 12,231 pounds, and it requires one and one third C-46 cargo planes for transportation.

2. Dismantling. Following is a convenient sequence of disassembly:

(1) Operator's seat
(2) Engine covers and side panels
(3) Engine cover supports
(4) Disconnect wires from control board
(5) Motor control board
(6) Drive roll side covers
(7) Guide roll cover
(8) Drive roll
(9) Guide roll
(10) Frame and engine are left as one group

3. Loading. The frame and engine group must be placed on a standard type sled, with the sled under the heavy end. Plenty of grease must be used to slide this group into position. Fig. 121 and 122 show the frame and engine being loaded.

4. Man-Hours. A crew of six men worked the following hours:

Dismantling	2 men	12 mh
Loading	4 men	17 mh
Unloading	4 men	10½mh
Reassembly	2 men	12 mh
Total		51½mh

APPENDIX Q

DISASSEMBLY, GROUPINGS, AND LOADING OF THE TRUCK, DUMP, 2½-TON, 6 X 6, GMC; AND TRUCK, DUMP, 2½-TON, 6 X 6, GMC, (AIRBORNE)

I. Truck, Dump, 2½ Ton, 6 x 6, GMC

1. General. The GMC 2½ ton 6 x 6 dump truck weighs 10.087 pounds, and utilizes the cargo space of one and one third C-46 planes. Additional cargo should be loaded in the second plane, but it must be remembered that the CG must then be recomputed.

2. Dismantling.

a. Use the following disassembly sequence:

(1) Tail gate
(2) Remove dump body and cut in half lengthwise (See Figs. 128 and 135).
(3) Hood and engine side panels
(4) Steering wheel and column
(5) Cab
(6) Remove emergency brake, battery and box, exhaust pipe and muffler, tool box, gas tank and supports.
(7) Running boards and floor boards
(8) Disconnect rods and gas lines and remove engine
(9) Front wheel assembly
(10) Rear wheel assembly

b. In welding the body at reassembly, some difficulty may be encountered due to the thinness of the bottom of the dump. To prevent burning, the following procedure should be followed:

(1) Align the two sections by placing the body upside down on a flat even surface and carefully block in place.

(2) Tack the two sections together at the bottom channels, being careful not to touch the bottom plates.

(3) The channels themselves are welded and then a 3/8 x 6 x 1 inch strap is welded to reinforce each channel.

(4) A long strip is welded along the entire length of the cut (See Fig. 127).

(5) The body is turned rightside up and the bottom welded on the top side.

If, because of warping, difficulty occurs in aligning the body for welding, a simple expedient for pulling it in place is to tack an ordinary stove bolt (about one inch longer than the height of the bottom channels) to the bottom near the point of warping. Next a piece of scrap steel long enough to reach across the channels is drilled to receive the bolt. By placing this piece across the floor channels and placing a nut on the bolt, the floor can be drawn into alignment by tightening. If the floor is badly warped, several such expedients might be employed simultaneously. (See Sketch, Fig. 135).

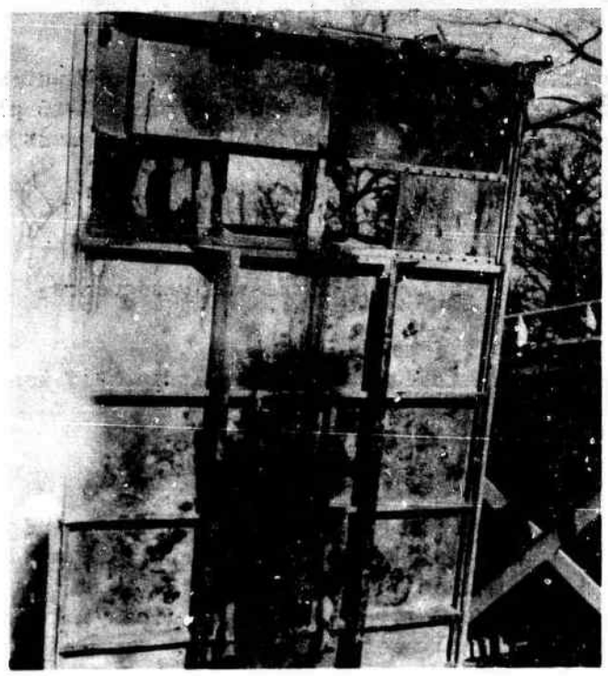

FIG. 127 TRUCK BED REWELDED
Note iron strap welded along entire length of cut.

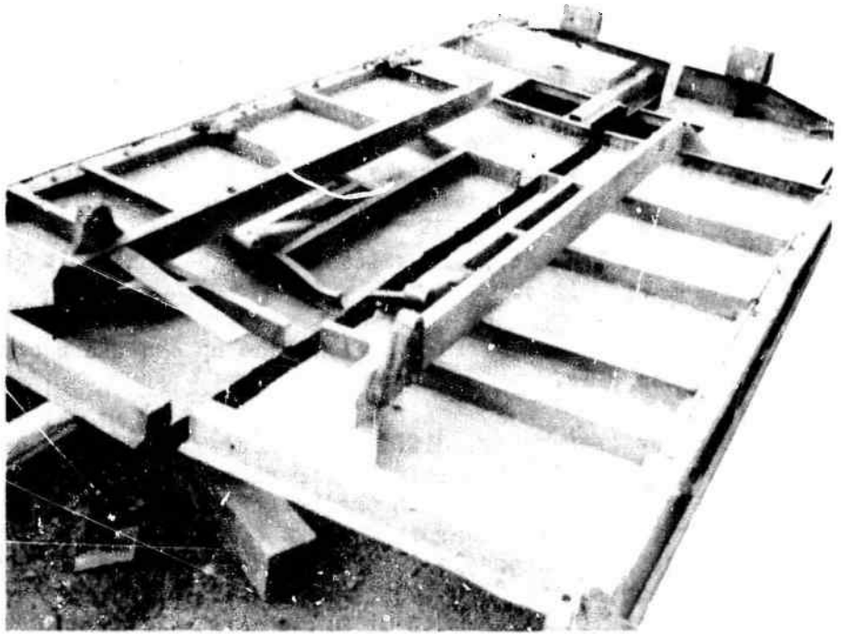

FIG. 128 SHOWING CUT ON TRUCK BED.

3. Loading. Tip the frame on its side to load it into the plane (See Figs. 129 and 130). The two halves of the dump body are placed on their sides once inside the plane. Note this position in the picture of the plane load, Fig. 132.

4. Man-Hours. A crew of nine men worked the following periods:

Disassembly	2 men	11 mh
Cutting	1 man	1½ mh
Loading	6 men	5½ mh
Unloading	6 men	4½ mh
Welding	1 man	2 mh
Reassembly	2 men	14 mh
Total		35 mh

Approximate total time in preparation of equipment:

For Flight	9 men	6 hours
For Operation	9 men	8 hours

II. Truck, Dump, 2½ Ton, 6 x 6, GMC (Airborne)

1. General. The Airborne model of the 2½ ton, 6 x 6 dump truck is made with a butt-plate type frame joint which allows the truck chassis to be separated into two large sections. By attaching a dolly (which Ordnance has developed, and which will be issued with the trucks or may, in some cases, be carried in the cargo planes) to the butt-plates of the front section, this section may be loaded under its own power when a ramp is used. The dump box is also provided with a joint so that it may be divided into two sections.

2. Disassembly. Following is the proper sequence of disassembly:

(1) Front bumper and windshield
(2) Truck side panels and front panel
(3) Disconnect dump box from dumping mechanism and remove dump box.
(4) Separate two sections of dump box
(5) Remove tailgate
(6) Remove gasoline tank, fenders and runningboards
(7) Remove spare tire

3. Loading. There are no loading difficulties. Follow the procedure outlined for the Class 135 Crash Truck (See Appendix R).

4. Man-Hours. A crew of 8 men worked the following periods:

		Ramp	Shears
Disassembly	4 men	8 mh	8 mh
Loading			
With ramp	4 men	10 mh	
With shears	4 men		14 mh
Unloading			
With ramp	4 men	7 mh	
With shears	4 men		10 mh
Reassembly	4 men	10 mh	10 mh
Total		35 mh	42 mh

Approximate total time in preparation of equipment for flight using ramp is 5 hours and using shears is 6 hours. Preparation of equipment for operation after the landing takes approximately 4½ hours using a ramp and 5 hours using shears.

APPENDIX R

DISASSEMBLY, GROUPINGS, AND LOADING OF THE TRUCK, FIRE, POWERED, CRASH, CLASS 135, COMPLETE WITH EQUIPMENT

1. General. Total weight of the Class 135 crash truck as prepared for air transport is 10,446 pounds and requires one and one-quarter C-46 cargo planes for transportation. This piece of equipment is mounted on a chassis provided with butt plate bolted frame joints which enable the chassis to be separated into two large sections.

A dolly (See Fig. 144) which was developed by Ordnance and will be issued on the basis of one for every three trucks or may in some cases be carried in the cargo planes, is bolted to the butt plates of the front section allowing this section to be driven into the plane under its own power when a loading ramp is used.

2. Dismantling. Front brackets on the left and right hose reel enclosures must be modified as shown in the sketch, Fig. 147, so as to leave room for the frame joint butt plates. The flat bed must be cut in two at the position shown in Fig. 148. The flat bed floor boards should be cut along the centerline of the wooden cross member so that they may be nailed back in reassembly (See Figs. 142 and 143).

The top of the cab must be removed in order for the truck front section to pass through the plane door. Bolt plate flanges are installed to provide a convenient method of rejoining the two cab sections. The sketches in Fig. 149 show details of these flanges.

Proper disassembly sequence is as follows:

(1) All accessories (lights, axes, nozzles, etc.)
(2) Front bumper
(3) Doors
(4) Top of cab (See Fig. 149)
(5) Front fenders and running boards
(6) Left and right hose reels and hose reel enclosures
(7) Rear step
(8) Left and right tool boxes
(9) Remove water tank from tank frame
(10) Remove tank frame from flat bed
(11) Remove and cut flat bed (See Fig. 148)
(12) Disconnect hydraulic and fuel lines
(13) Separate two sections of chassis and attach dolly to front section

3. Loading. The Ordnance dolly is modified by the addition of a Porto-Power hydraulic jack and the parts shown in Fig. 144 and 150. It is advantageous to keep the rear end of the front chassis section as low as possible during loading with a ramp, in order that the section may clear the plane door. There is danger, however, of damage to the plane floor if the modification is not used, since it allows the rear end of the section to be raised or lowered at will. The auxilliary gasoline tank shown in Figs. 145 and 146 must be attached to the fuel line to provide gasoline for the engine.

The front chassis section is driven up the ramp, with one man steering the dolly by means of its handle, until the hub of the left front

wheel is as close as possible to the front edge of the plane door. The dolly is raised so that the section will clear the plane floor. Then the wheels are cramped to the left and the section driven into the plane as far as it will go without scraping the fuselage. The dolly wheel is then turned perpendicular to the line of the plane and the rear end of the section rolled into the plane by manpower. Drive the section forward to its loaded position.

The loading ramp should be so constructed that its top platform is some six to eight inches below the bottom of the door in the unloaded plane, since the plane settles as it is loaded. Men standing on the edge of the door will bring it down into line with the ramp as the chassis section moves from the ramp into the plane.

Miscellaneous parts box No. 1, plane load No. 1, is placed inside the tank frame, and one end of the tank itself rests on top of the box. This is done to make it easier to remove the tank by manpower in unloading. In the same plane load the rear chassis section is kept upright by resting one end on the tank frame and the other on miscellaneous parts box No. 2.

4. Man-Hours. A crew of 8 men worked the following hours:

		Ramp	Shears
Disassembly	3 men	18 mh	18 mh
Cutting	1 man	2 mh	2 mh
Loading			
With ramp	4 men	12 mh	
With shears	4 men		16 mh
Unloading			
With ramp	4 men	8 mh	
With shears	4 men		12 mh
Reassembly	3 men	24 mh	24 mh
Total		64 mh	72 mh

Approximate total time in preparation of equipment for flight is 9 hours using a ramp and 10 hours using shears for loading. Approximate time in preparation of equipment for operation after landing is 10 hours when a ramp is used and 11 hours using shears.

APPENDIX S

DISASSEMBLY, GROUPINGS. AND LOADING OF THE DISTRIBUTOR, BITUMINOUS MATERIAL, TRAILER-MOUNTED, 1250-GALLON, TYRE MODEL MX, STYLE RE

1. General. The total weight of the Etnyre Distributor is 11,609 pounds, and it requires one and one half C-46 cargo planes for transportation.

2. Dismantling. In order that the tank of the distributor may be lifted from the frame, carrying hooks must be welded onto the upper side of the tank. See Figs. 161 and 162 for photos of these hooks. All new distributors now coming from the Etnyre factory are equipped with carrying hooks prior to shipment. The new airborne model also is provided with a tank that may be divided in to two parts by removing a number of bolts.

The overflow dome on the tank must be removed before loading. Following is a convenient sequence of disassembly.

(1) Accessories (hose, portable burner, fire extinguisher, spray bar extension, pouring, 3 quart measure).
(2) Disconnect blower, flexible tube, fuel lines, drive chain
(3) Platform and spray bar assembly
(4) Right and left fender and brace (brace must be cut from frame)
(5) Clearance wires and lights
(6) Running board assemblies
(7) Distributor frame and bumper
(8) Pump housing and control assembly
(9) Tank
(10) Bitumeter with 5th wheel assembly
(11) Rear axle, spring, and wheel assembly
(12) Front axle, spring, and wheel assembly

3. Loading. Although the tank is a close fit in passing through the door, it is not difficult to load. After the tank has been set down inside the door, it must be rotated 45 degrees in a counter-clockwise direction. From this tilted position, it can readily be maneuvered into the plane.

4. Man-Hours. A crew of eight men worked the following hours.

Dismantling	2 men	12 mh
Loading	4 men	32 mh
Unloading	4 men	30 mh
Reassembly	4 men	14 mh

APPENDIX T

DISASSEMBLY, GROUPINGS, AND LOADING OF THE COMPRESSOR, AIR, DIESEL-ENGINE-DRIVEN, TRAILER-MOUNTED, STEEL WHEELS, 315 CFM, INGERSOLL RAND MODEL IK 315, WITH INTERNATIONAL HARVESTER ENGINE, MODEL UD-18

1. General. The total weight of the Air Compressor is 8075 pounds, and it requires one C-46 cargo plane for transportation.

2. Dismantling. Following is a list of the only parts which must be removed for safe and convenient loading:

(1) Air intake pipe
(2) Muffler pipe
(3) Hood
(4) Air cleaner
(5) Wheels, axles, and springs (each set as a group).

3. Loading. Since the compressor is loaded almost as a unit, it results in an unusually heavy single piece (6730 pounds). Therefore, if possible, the sled should be equipped with metal covered runners and metal tracks should be laid in the plane to facilitate the loading. Plenty of heavy grease must be used. The sled upon which this unit is loaded, must be at least eight feet long. Figs. 163 and 174 show a method of loading this heavy engine group.

4. Man-Hours. A crew of six men worked the following hours:

Dismantling	2 men	2 mh
Loading	4 men	16 mh
Unloading	4 men	16 mh
Reassembly	2 men	2 mh
Total		36 mh

APPENDIX U

DISASSEMBLY, GROUPINGS, AND LOADING OF THE SCRAPER, SELF-LOADING, TOWED, CABLE-OPERATED, 8 CU YD, LETOURNEAU MODEL LS (AIRBORNE)

1. General. The LeTourneau Model LS, 8 cubic yard scraper (airborne) weighs approximately 17,125 pounds, and requires two C-46 cargo planes for transportation. It is fitted with butt-plate and flange joints in order that it may be easily disassembled and loaded into the transport.

2. Dismantling. There are no difficult disassemoly problems. Use the following sequence:

(1) Rewind all cable onto spool
(2) Rear wheels
(3) Spiral sheave
(4) Rear hitch
(5) Push beam
(6) Push beam housing
(7) Spring pipe
(8) Apron
(9) Tailgate
(10) Rear cross section
(11) Left and right sides of bowl
(12) Separate two sections of yoke
(13) Front wheels

3. Loading. There are no loading difficulties.

4. Man-Hours. A crew of 8 men worked the following periods:

Disassembly	4 men	16 mh
Loading	4 men	23 mh
Unloading	4 men	18 mh
Reassembly	4 men	20 mh
Total		77 mh

Approximate total time in preparation of equipment for flight is 7 hours, and for operation after the landing is 6 hours.

APPENDIX V

DISASSEMBLY, GROUPINGS, AND LOADING OF THE CRUSHING AND SCREENING PLANT, GRAVEL AND ROCK, 2 UNITS, GASOLINE-ENGINE-DRIVEN, SEMI-TRAILER MOUNTED, WITH DOLLIES, 25 CU YD PER HOUR, IOWA MANUFACTURING COMPANY, MODEL 25 CUBIC YARD

1. General. As prepared for transportation by air, the total weight of the Cedar Rapids rock crushing and screening plant is 76,299 pounds. The primary unit weighs 32,120 pounds, and the secondard unit 34,965 pounds; there are 6,560 pounds of spare parts, and 2,654 pounds are utilized in sleds, boxes and crates. Nine C-46 cargo planes are required for transportation.

2. Dismantling. Chief problem in dismantling both the primary and secondary units is the breakdown of the frame. Length of the frame prohibits its being loaded into the plane in one piece.

a. Primary Unit Frame Joint. The Primary Unit frame is converted to airborne loads in the following manner:

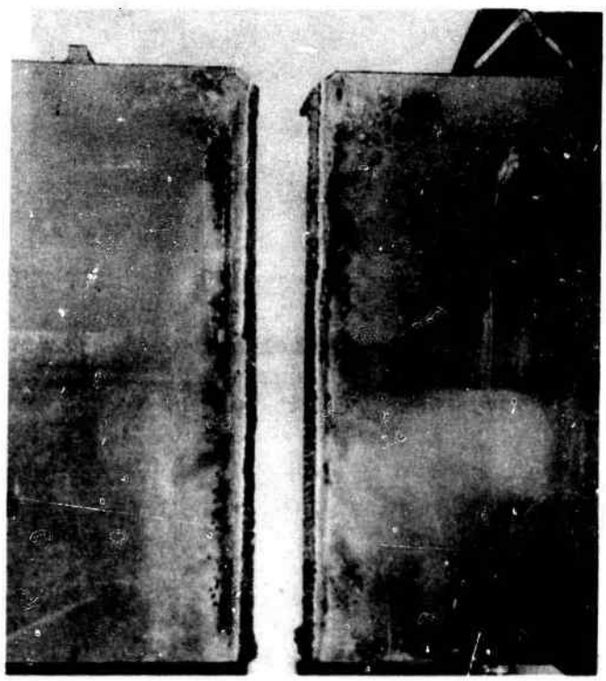

FIG. 172. CUT IN FRAME, PRIMARY UNIT

(1) The frame is cut at the position indicated in the sketch, Fig. 17?. The cuts are V-notches as shown above for a stronger bond in the subsequent welding. Lengths of angle iron are tack welded between the frame channels at the top outside and bottom inside on each side of the point to be cut to prevent warping of the frame while the joint is being fabricated. One of the irons may be seen in the upper right of Fig. 172. It is advisable, also, in order to forestall warping, to complete the work on one frame channel before starting on the other.

FIG. 173. BUTT-PLATES INSTALLED (PRIMARY UNIT)

(2) The two butt-plates are bolted together and welded into the frame cut as shown above. Dimensions of the plates (Plate D) are shown in Fig. 177. Dowels in the plates to aid in aligning the frame.

FIG. 174. TENSION-COMPRESSION UNIT (PRIMARY UNIT)

(3) Plates A and B, as shown in Fig. 177, are joined together to form the above tension-compression unit. Note that the upright plate (A) is a right triangle; note also the V-notching.

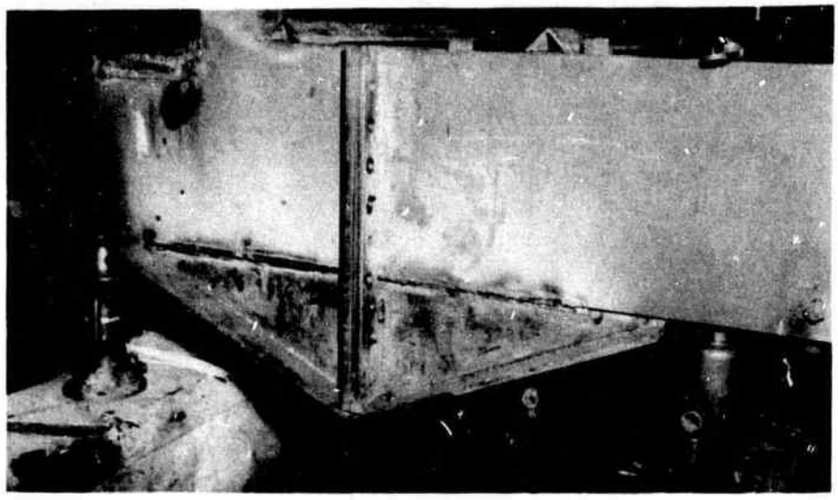

FIG. 175. TENSION-COMPRESSION UNITS INSTALLED (PRIMARY UNIT)

(4) Two of the tension-compression units are welded to the underside of the frame channel and to the plates, as shown above. Note that the bolts have been removed for the convenience of the welder, and that jacks hold the frame in alignment.

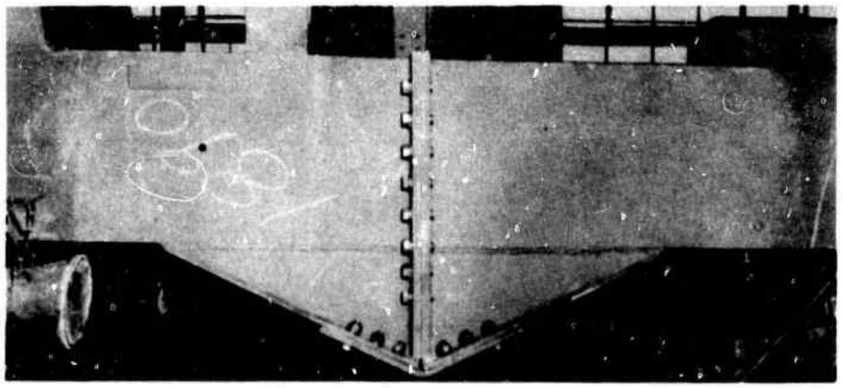

FIG. 176. FINISHED JOINT (PRIMARY UNIT)

(5) The bolts are replaced in the butt-plates, and the tension plate (Plate C in Fig. 177) is bolted to the bottom of the joint. The butt-plates were originally drilled and tapped, as can be seen above. It was found, however, that use of bolts and nuts would prove more satisfactory. This latter method is recommended.

Fig. 178

b. Secondary Unit. Because the load on the secondary unit frame is less concentrated, the joint for this unit is not so complex as that of the primary unit. Then, too, the number of attachments to the former make a small joint desirable. The secondary unit frame is processed in this manner:

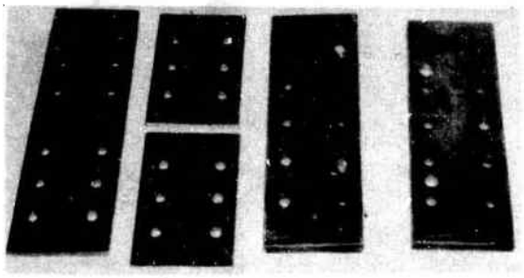

FIG. 179. PLATES USED IN JOINT (SECONDARY UNIT)

(1) The plates used in processing the secondary unit joint are shown in Fig. 179. Note the dowels and dowel holes in the butt-plates (on the right). The tension plates (on the left) are made by obtaining two plates of the proper size (see Fig. 178), drilling them at the same time to be sure the bolt holes line up, and then cutting one of the plates in half.

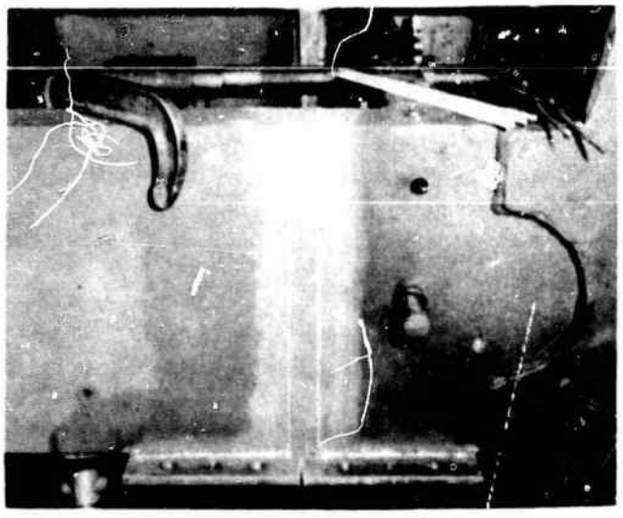

FIG. 180. SMALL TENSION PLATES IN PLACE (SECONDARY UNIT)

(2) The three tension plates are bolted together, the two smaller ones on the same side of the largest one. The two small plates are welded to the underside of the frame channel with the point where the two small plates meet directly under the center of the proposed cut. When the weld is completed, the large plate is unbolted and removed, its purpose thus far being merely to hold the small plates in position.

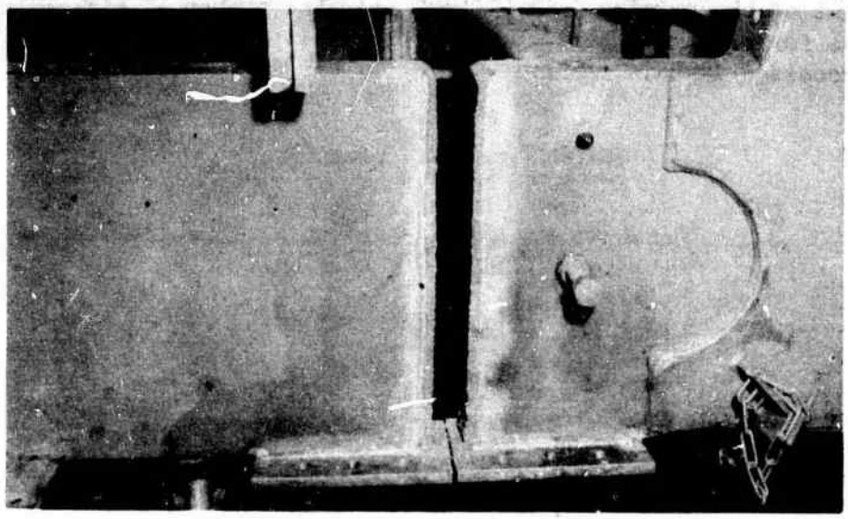

FIG. 181. CUT READY FOR BUTT-PLATE (SECONDARY UNIT)

(3) The frame is cut as shown above. The cut must be wide enough to accommodate the two butt-plates, and should be V-notched. The frame is kept from warping by its cross members; thus the necessity for the angle irons used on the primary unit is eliminated.

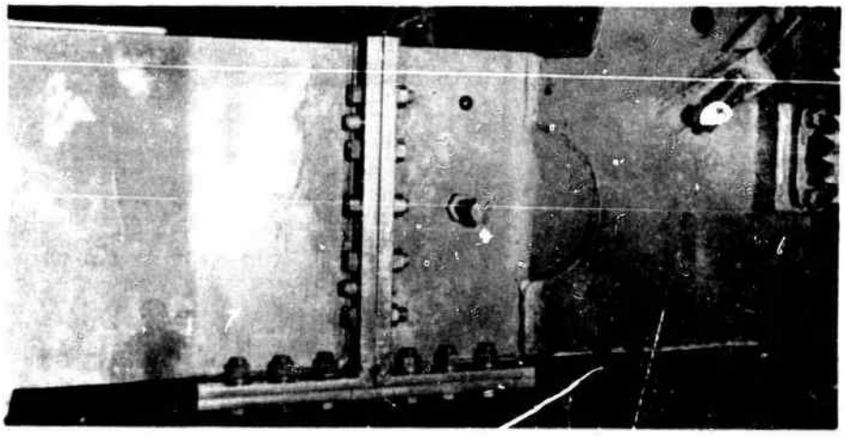

FIG. 182. FINISHED JOINT (SECONDARY UNIT)

(4) The butt-plates are welded into position as shown above and the large tension plate is bolted back into its place.

c. Position of the primary unit frame joint makes it necessary to move the brackets for the stone hook up to a spot forward of the gooseneck, as shown in Fig. 184. It also necessitates a change in the way the walk-way ladder fastens to the frame. A coupon is welded to the flange of the frame joint, the end of the front ladder leg is flattened and is bolted to the coupon (see sketch, Fig. 184).

d. Sequence for Disassembling The Primary Unit. To disassemble the primary unit, remove parts and units in the following order:

(1) Remove all drive belt guards, and drive belts and chains
(2) Feeder hopper and shaker assembly
(3) Hopper support frame assembly
(4) Operator's walk way and ladder
(5) By-pass chute
(6) Engine, with mounting skids
(7) Jaw crusher unit (complete)
  (a) Remove both flywheels
  (b) Toggle plate tension rod and spring
  (c) Four key plates
  (d) Stationary jaw
  (e) Eccentric shaft bearing caps (these must be removed before the next step)
  (f) Movable jaw, pitman and eccentric shaft assembly
  (g) Toggle plate, adjusting bolts and wedges
(8) Delivery conveyor, upper section
(9) Delivery conveyor, tail section and hopper
(10) Remove light cables and cut air lines (fittings must be placed on the air lines to facilitate reassembly
(11) Disconnect frame at joint (see Figs. 172 thru 176 for fabrication of frame joint)
(12) Remove dolly from frame
  (a) Remove pull tongue assembly
  (b) Wheels
(13) Rear axle and oscillating beam assembly (To hold the oscillating beams rigid during handling, metal straps are used. At each end of the axle two straps connecting the axle frame support flange and the top of the oscillating beam are fastened, one in front of the axle and one behind it. See sketch, Fig. 183)
  (a) Remove wheels

e. Sequence for Disassembling The Secondary Unit. The secondary unit is disassembled in the following order:

(1) Feed conveyor hopper
(2) Feed conveyor tail section
(3) Feed conveyor intermediate section
(4) Spare wheel and tire
(5) Carrier for spare wheel and tire

(6) All drive belt guards, drive belts, and chains. (The lower bracket attaching the main drive belt guard to the frame must be modified as shown in the sketch, Fig. 183. A section of the bracket is cut out and the remainder is welded to the side edge of the bottom frame joint tension plate. A small section of the guard itself must be cut out to accommodate the vertical frame joint flange, see Fig. 183.)
(7) Engine
(8) Feed conveyor head section
(9) Delivery conveyor
(10) Walk way, ladder and hand rails
(11) Main drive countershaft assembly
(12) Sand conveyor
(13) Shaker and vibrating screen assembly
(14) Screen hopper
(15) Front screen frame supports
(16) Roll crusher extension
(17) Roll crusher assembly (complete)
(18) Roll conveyor
(19) Roll crusher rear support frame
(20) Elevating wheel (to remove, loosen front adjusting rollers)
(21) Elevating wheel supports and support rollers
(22) Cut out a small section of the frame cross member, remove the bearing attaching bolts, and allowing the sand conveyor drive pulley shaft to pass down out of the cross member through the new cut, remove the sand conveyor drive pulley assembly. See Fig. 185.
(23) Cut air lines and disconnect electric lines at front junction box. (Fittings must be placed on the air lines to facilitate reassembly)
(24) Disconnect frame at joint (See Figs. 178 through 182 for fabrication of the frame joint)
(25) Oscillating beam and rear axle assembly (To hold the oscillating beams rigid during handling, metal straps are used. Two straps connecting the axle frame support flange and the top of the oscillating beam are fastened at each end of the axle, one front of the axle and one behind it. See sketch, Fig. 183.)
(26) Dolly
(a) Remove tongue and wheels
(27) Screw jacks (4)

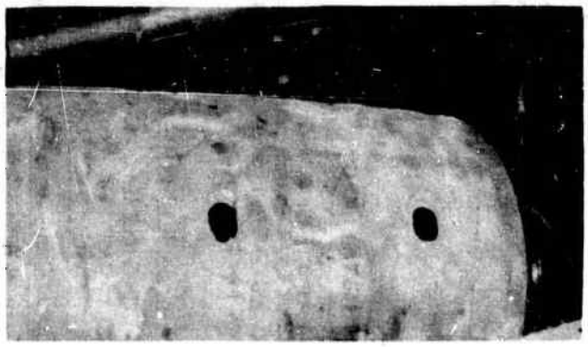

FIG. 185. CUT IN FRAME CROSS MEMBER TO ALLOW REMOVAL OF SAND CONVEYOR DRIVE PULLEY.

FIG. 186. SLED FOR ROLL CRUSHER ASSEMBLY.

3. Loading. Although there are a number of bulky sub-assemblies, loading is comparatively simple. The standard sled must be modified as shown in Fig. 186 to accommodate the roll crusher assembly, which weighs 7,200 pounds. In loading this group, two 2 x 12 inch planks 10 feet long are placed under the sled runners for further distribution of weight. Similar planks may be used instead of sleds for loading all four of the frame sections.

In loading the engines of both units, the air cleaner must be removed before the assembly will clear the door. Once the engine is inside the plane the air cleaner may be replaced.

4. Man-Hours. A crew of 10 men worked the following periods:

		Primary Unit	Secondary Unit
Disassembly	4 men	70 mh	84 mh
Frame Joint	2 men	30 mh	16 mh
Loading	4 men	28 mh	36 mh
Unloading	4 men	21 mh	28 mh

APPENDIX W

DISASSEMBLY, GROUPINGS, AND LOADING OF THE TRACTOR, CRAWLER TYPE, DIESEL-ENGINE-DRIVEN, 35-40 DBHP, RIGID, 60-INCH GAUGE, CATERPILLAR MODEL D-4, COMPLETE WITH LOADER BUCKET, CABLE-OPERATED, FRONT-MOUNTED, 3/4 CU YD, TRACKSON TRAX-CAVATOR MODEL T-4, AND TRACKSON DOZER ATTACHMENT (NON-STANDARD ATTACHMENTS)

1. General. The traxcavator and its tractor weigh approximately 16,612 pounds and require cargo space of two C-46 planes for transportation.

2. Dismantling. Following is the proper sequence for disassembly:

(1) Remove V-drive belts and rewind cables on drums
(2) Remove bucket, and universal and shaft unit
(3) Break and lay out track (necessary in order to provide ample room for removal of traxcavator from tractor)
(4) Remove traxcavator truss rod assembly and control levers and rods
(5) Remove lower bolts on traxcavator lower frame
(6) Separate traxcavator frame from tractor
(7) Remove lifting arm assembly from traxcavator frame
(8) Separate hoist unit and lower traxcavator frame by burning the weld free
(9) Remove inner bearing caps and front idlers (necessary in order to remove cross member, since idler bolts run through it)
(10) Remove cross member
(11) Remove roller frame assemblies
(12) Remove fenders, seat, fuel tanks and drawbar assembly

In reassembly, the forward junction of the hoist unit and lower traxcavator frame is bolted with countersunk plow bolts instead of rewelded. This eliminates the necessity for cutting and welding in subsequent disassembly and assembly. Fig. 209 shows the hoist unit with bolts installed.

3. Loading. The engine and transmission group weighs 5,905 pounds and will require a sled at least six and one-half feet long.

4. Man-Hours. A crew of 8 men worked the following periods:

Disassembly	4 men	28 mh
Loading	4 men	16 mh
Unloading	4 men	12 mh
Reassembly	4 men	32 mh
Total		88 mh

An 8-man crew can prepare the traxcavator for flight in about 7 hours, and can have the machine ready for operation approximately 9 hours after the landing.
