FOREWORD

The documentation of the computer program described in this report was performed during Fiscal Year 1976 and is a subproject supported by Naval Air Systems Command AirTask A350-350B/008B/4F32-353-505.

It is part of a continuing effort to describe and document methodologies for computer simulation of aeroballistic performance of small-caliber, gun-fired projectiles.

This report was reviewed for technical accuracy by Richard Compton.

(U) *Parametric Trajectory Program*, by John E. Peterson. China Lake, Calif., Naval Weapons Center, October 1976. 74 pp. (NWC TP 5864, publication UNCLASSIFIED.)

(U) This aeroballistic three-degree-of-freedom computer program was developed to predict trajectories of both air-fired and ground-fired projectiles, and to prepare trajectory tables to assist designers of new or experimental ordnance.

(U) It is an efficient and inexpensive program to run, and is thus valuable in preparing extensive data for analysis of the various projectile design parameters.

CONTENTS

INTRODUCTION

This report describes a three-degree-of-freedom particle trajectory program for calculation of range tables and trajectories for gun-fired projectiles. It has been designed to give maximum data coverage needed by the projectile designers and weapon effectiveness analysts, consistent with minimum computer time and cost. This permits large numbers of computer runs, at minimal cost, for parametric studies involving a number of design parameters, and for design optimization.

While this program was designed for the UNIVAC 1110 computer, it is written in standard FORTRAN IV, and is easily adapted for other computers using this language. The program is also designed for easy modification and, in actual practice, a large number of variations have been used for special requirements and conditions, such as the tail-chase and head-on firings, special atmospheric models, special input format, etc.

The accuracy of this program has been verified with "real life" data obtained from instrumented range firings, with the computed trajectory data agreeing within the experimental error of the instrumentation. However, in common with all three-degree-of-freedom programs, it does not give dynamic stability data. When this is needed, the six-degree-of-freedom programs must be used.

The primary feature of this program is to prepare trajectory tables in final form, ready for use as "masters" in reports and other publications. These tables include a total of 14 variables, as follows: time, altitude, velocity, horizontal range, slant range, trajectory drop, static moment coefficient per radian, drag, kinetic (impact) energy, yaw of repose, Mach number, spin, impact angle, and the gyroscopic stability factor.

The second feature of this program is the card output for use in various plotting programs. These card outputs permit complete flexibility in displaying a series of selected runs in parametric plots. While special plotting programs have been prepared for these card outputs, they are written for use with the DISSPLA plotting system, and will be described in a separate report.

PROGRAM DESCRIPTION

This three-degree-of-freedom point trajectory program was designed for use in preparing trajectory data for air-to-air, air-to-surface (strafing), or surface-to-surface firing conditions. It is written in standard FORTRAN IV and designed for use with the UNIVAC 1110 computer, but it should be usable with any computer using standard FORTRAN IV or V language. To reduce computer time and cost, subroutines were not used, and this makes the program very inexpensive to run.

The program consists of 283 cards for the basic program and 19 cards for the data deck. The program glossary is shown in Appendix A, and the program is listed in Appendix B. The input deck is described separately in this report.

Several versions of this basic program have been prepared and used by the author for special requirements, such as unusual atmospheric models, head-on and tail-chase firing conditions, etc. To aid the reader in preparing such special programs, a complete listing of the program line number references is shown in Appendix C, and a complete flow chart of the program is shown in Appendix D. Sample outputs and inputs are included in Appendixes E and F.

AEROBALLISTIC EQUATIONS

The basic equations for this parametric trajectory program are given below.

Drag Equations

$$D = (1/2)\ \rho V^2 S C_D$$

where

D = drag, lb

ρ = air density, slugs/ft^3

V = velocity, ft/s

S = frontal area, ft^2

C_D = drag coefficient

and

$$C_D = C_{D_o} + C_{D_o}(\delta_r)^2$$

where

C_D = drag coefficient
C_{D_o} = drag coefficient at zero yaw
δ_r = yaw of repose, rad

Note: For this program, the angle of attack and yaw of repose are considered equivalent.

Gyroscopic Stability Factor Equation

$$s_g = \frac{2(I_x)^2 p^2}{\pi \rho I_y d^3 V^2 C_{M_\alpha}}$$

where

s_g = gyroscopic stability factor
I_x = axial moment of inertia, slug-ft^2
I_y = transverse moment of inertia, slug-ft^2
p = roll rate, rad/s
d = diameter, ft
V = velocity, ft/s
C_{M_α} = static moment coefficient, per rad

Yaw of Repose Equation

$$\delta_r = \frac{I_x g p \cos \theta}{(\rho/2) S d C_{M_\alpha} V^3}$$

where

δ_r = yaw of repose, rad
I_x = axial moment of inertia, slug-ft^2
g = gravitational constant, ft/s^2
p = roll rate, rad/s
θ = trajectory angle, rad
ρ = air density, slug/ft^3
S = frontal area, ft^2
d = diameter, ft
C_{M_α} = static moment coefficient, per rad
V = velocity, ft/s

Trajectory Increments

$$\bar{V} = V_o + (A_o + A_t/4)\ \Delta t$$

$$\bar{\theta} = \theta_o - \cos\theta\ \Delta t/\bar{V}$$

$$A_t = -(g \sin\theta + D/m)$$

$$\Delta z = (\bar{V} \sin\theta)\ \Delta t$$

where

A = acceleration, ft/s^2
D = drag, lb
m = mass, slugs
V = velocity, ft/s
θ = trajectory angle
x = horizontal distance, ft
z = vertical distance, ft
g = gravitational constant, ft/s^2

STANDARD ATMOSPHERE

This program uses the ICAO standard atmosphere. A sea level pressure of 760 mm of mercury at a temperature of 15°C is assumed. This is equivalent to 14.69 psi and 59°F. The standard density of dry air at these standard conditions is 0.002378 slug/ft^3 (NACA 1942). The temperature variation with altitude is as follows:

Up to 36,500 ft

$$T = 59 - 0.00356\ h$$

where

T = temperature, °F

h = altitude (ft) above mean sea level (MSL)

Above 36,500 ft

Temperature is assumed to be a constant -70°F.

The acoustic velocity is given by the following equation:

$$V_a = 49.1\ \sqrt{460 + T}$$

where

V_a = acoustic velocity, ft/s

T = temperature, °F

INPUT DATA

The data input for this program is in the form of a 19-card input data deck for a normal individual computer run, as shown in Table 1. However, as noted in the table, additional runs are possible.

The program uses a 12-point "drag table," including both 12 points for the drag coefficient at zero yaw, and 12 points for the static moment coefficient, per rad. The program then interpolates the data as required between these points. For Mach numbers above or below the range of these data, the program uses a constant maximum or minimum value, i.e., the last data point. While it is possible to modify the program to accept fewer than 12 data points, experience has shown that at least this number should be used.

It is possible to make additional runs using the same general projectile configuration, but changing the firing conditions and/or the projectile weight, moments of inertia, or muzzle velocity. In this case, as shown in Table 1, cards 16-19 must be repeated.

TABLE 1. Input Data.

Symbol	Format	Description	Units
		Cards 1-12	
N	I2,8X	Drag table line number	
CDO(I,1)	F10.4	Mach number for CDO(I,2)	
CDO(I,2)	F10.4	Drag coefficient at zero yaw

PINT	F10.2	Printout skip	(Note 4)
		Card 19	
JRUN	I2	Additional runs Last run ≤ 0 Additional runs > 0 For additional runs, repeat cards 16, 17, 18, & 19	

NOTES:

1. Drag table scaling constant multipliers. These are normally set at 1.0, i.e., the drag table applies to the round in question. If no drag table is available for the projectile, these scaling factors can be applied to drag tables for similar rounds. In that case, the FFD applies to the drag coefficient data, and FFM applies to the static moment coefficient data.
2. The time increment "DTM" is optional, but normally, a time increment of 0.1 second has been found adequate.
3. Quadrant elevation "QE" refers to the gun elevation relative to the horizontal. A positive QE represents elevation above the horizontal, and a negative QE represents a negative (down) elevation or dive angle.
4. The printout skip "PINT" permits printout at selected time intervals.

CARD OUTPUT

The program is designed to automatically prepare a card deck for use as input to various plotting routines. This card output prepares one card per data "line" in the main trajectory tables, and includes 10 variables, as follows: time, horizontal range, altitude (MSL), slant range, velocity, kinetic (impact) energy, trajectory drop, spin, impact angle, and gyroscopic stability factor (see Table 2).

These 10 variables are mainly of concern to the projectile designers and weapon effectiveness analysts, but the additional trajectory drop (trajectory drop relative to the line of sight for the gun) is of special interest to those concerned with gunsights and related effects.

Where this card output feature is not required, it can easily be eliminated by removing card No. 19, 130, and 277 in the main program.

The use of separate output decks for computer runs was found extremely valuable for parametric studies where comparison plots could be prepared for various combinations of calibers and/or projectile characteristics. Also, since various combinations of the 10 variables can be plotted, these card outputs are extremely flexible in fulfilling special plotting requirements.

TABLE 2. Card Output.

Symbol	Format	Description	Units
		Card 1	
TITLA	5A6	Title for identification	
		Card 2-N	
TIME	F7.2,1X	Time	seconds
X	F7.0,1X	Horizontal range	feet
Z	F7.0,1X	Altitude (MSL)	feet
SLNT	F7.0,1X	Slant range	feet
V	F6.1,1X	Velocity	ft/s
ENG	F8.0,1X	Kinetic energy	ft-lb
DH	F6.1,1X	Trajectory drop	feet
RPS	F7.0,1X	Spin	rev/s
TTT	F6.2,1X	Impact angle (versus horizontal)	degrees
SG	F6.2	Gyroscopic stability factor	

TYPICAL TRAJECTORY TABLE OUTPUT

The program is primarily designed to prepare trajectory tables in final form and ready for publication in reports, or for immediate use by projectile designers and weapon system effectiveness analysts. These tables print out the trajectory data, a total of 14 variables, in an easily read double-line format, at preset time increments. In the trajectory table example shown in Appendix E, a time increment of 0.1 s was used, but this time increment can be changed merely by changing the printout skip ("PINT") in card 18 of the input data deck.

The program as listed uses an altitude cutoff; i.e., the program stops when it reaches the specified target altitude. Changes can easily be made by qualified programmers for special requirements, such as maximum range cutoff; but, for most cases, the altitude cutoff has been satisfactory.

When the program reaches the cutoff point, it calculates the exact time, slant range, velocity, impact angle, spin, and the gyroscopic stability factor. This is then printed out at the end of the trajectory table.

A typical example of the trajectory table output is shown in Appendix E, which is the output generated by the input listed in Appendix F. This example also shows the additional data printed at the end of each trajectory table, including ballistic data, drag table, and legend.
