SYMMETRICAL DIPHOSPHATETRAAZACYCLOOCTATETRAENES

9 Patent Application, * Filed 26 Jun 80

ABSTRACT OF THE DISCLOSURE

This invention relates to

A process method for synthesizing symmetrical

diphosphatetraazacyclooctatetraenes and the products produced thereby. The synthesis involves effecting a reaction between a diaryltri-halophosphorane and a perfluoroalkyl amidine in the presence of an acid acceptor.

STATEMENT OF GOVERNMENT INTEREST

The invention described herein may be manufactured and used by or for the Government for governmental purposes without the payment of any royalty thereon.

BACKGROUND OF THE INVENTION

This invention relates to the synthesis of symmetrical diphosphatetraazacyclooctatetraenes and to novel eight-membered ring heterocyclic compounds produced thereby. More particularly, this invention concerns itself with a novel method for synthesizing 1,5-diphospha-2,4,6,8-tetraazacyclooctatetraenes. The resulting products exhibit excellent antioxidant and anticorrosion characteristics making them excellent candidates for use as additives in engine oils, hydraulic fluids and greases as well as in other applications apparent to those skilled in the art.

VP

Present interest in the utilization of perfluorinated fluids for high temperature lubricant applications has provided an impetus in a research effort directed toward the discovery of antioxidant and anticorrosive additives. Because of their thermal stability, the perfluorinated fluids have a great potential for use in lubrication and hydraulic applications. However, there is a serious drawback in their use resulting from the fact that certain metals present in aircraft components tend to corrode and degrade the fluids being used as lubricants. This occurs at temperatures above 550°F in an oxidative environment.

It would be highly desirable, therefore, to provide an additive for the perfluorinated fluids that would overcome the degradation and corrosion problems associated with their use. As a consequence, a considerable research effort has evolved in an attempt to provide such additives and an efficient and convenient method for their synthesis. As a result of this effort, it has been found that symmetrical diphosphatetraazacyclooctatetraenes can be obtained by effecting a reaction between a perfluoroalkylether amidine and a trihalophosphorane. The corrosion problems encountered when using perfluorinated fluid lubricants are obviated by using the additives of this invention.

SUMMARY OF THE INVENTION

In accordance with this invention, it has been found that symmetrical diphosphatetraazacyclooctatetraenes can be prepared by effecting a reaction between a perfluorinated amidine and a diaryltrihalophosphorane in the presence of an acid acceptor at temperatures ranging from about 30 to 100°C. The resulting 8-membered ring heterocyclic compounds are illustrated by the following structural formula

10

15

wherein R' and R'' substituents on the phosphorus can be the same or different and are selected from the group consisting of aryl radicals such as C₆H₅ and R-C₆H₄, and perfluoroaryl radicals such as C₆F₅ and R_fC₆F₄; R is selected from the group consisting of aryl, alkyl, perfluoroalkyl and perfluoroalkylether radicals; R_f is selected from perfluoroalkyl and perfluoroalkylether radicals as represented by the general formula C_nF_{2n+1},

20

or any combinations thereof which are readily apparent to those skilled in the art. The letter n represents an integer of from zero to 20.

26

Accordingly, the primary object of this invention is to provide a convenient and efficient method for synthesizing symmetrical diphosphatetraazacyclooctatetraenes.

Another object of this invention is to provide a novel series of compounds which are especially useful as antioxidant and anticorrosive additives for perfluorinated lubricants.

Still another object of this invention is to provide a convenient process for synthesizing symmetrical cyclooctatetraenes through the interreaction of a perfluoroalkylether amidine and a trihalophosphorane.

The above and still further objects and advantages of the present invention will become more readily apparent upon consideration of the following detailed disclosure thereof.

DESCRIPTION OF THE PREFERRED EMBODIMENT

The present invention encompasses a process for synthesizing symmetrical diphosphatetraazacyclooctatetraenes by reacting perfluoroalkyl or perfluoroalkylether amidine with a diaryltrihalophosphorane. The resulting 8-membered ring heterocyclic compounds possess great potential as antioxidant and anticorrosive additives for use in perfluorinated fluid lubricants, greases and hydraulic fluids. They are best illustrated by the following general structure:

while the procedure for synthesizing these compounds can best be exemplified by referring to the following general equation:

wherein the diaryltrihalophosphorane is reacted with an equimolar quantity of perfluoroalkylether or perfluoroalkyl amidine at 30 to 100°C in the presence of an acid acceptor giving concurrently with hydrogen halide elimination a symmetrical diphosphatetraazacyclooctatetraene. The substituent R_f can be selected from perfluoroalkyl and perfluoroalkylether groups as represented by the general formulae C_nF_{2n+1}, C₂F₅(OCF₂CF₂)_nOCF₂, or C₃F₇[OCF(CF₃)CF₂]_nOCF(CF₃). The substituents R' and R'' on the phosphorus can be the same or different aryl groups such as C₆H₅, R-C₆H₄ (wherein R can be aryl, alkyl, perfluoroalkyl or a perfluoroalkylether moiety), perfluoroaryl (C₆F₅, R_fC₆F₄), or any other type of a substituent as should be readily apparent to those skilled in the art. The substituent X on the phosphorus can be either chlorine or bromine. The letter n is an integer of from zero to 20.

The materials to be used in preparing the 1,5-diphospha-2, 4, 6, 8-tetraazacyclooctatetraene are known compounds that are described in the literature. Diphenyltrichlorophosphorane is a

common chemical, whereas perfluoroalkylether amidines are described by P.D. Schuman et al in British Patent 1,350,806 (1974).

5 The following examples are presented in order to more fully understand the nature of the invention and how it may be carried into effect. These examples illustrate specific embodiments of the invention and are not to be construed as limiting the invention in any way.

EXAMPLE I

10 Under nitrogen by-pass, a solution of amidine, $C_3F_7OCF(CF_3)C(=NH)NH_2$, (2.89 g, 8.81 mmol) and triethylamine (3.9 ml, 27.96 mmol) in Freon-113 (20 ml) was added over a period of 1.7 hr to a solution of diphenyltrichlorophosphorane (5.48 g, 18.8 mmol) in benzene
15 (50 ml) at 50°C. The mixture was then stirred at 50°C for 87 hr. After removal of solvents under reduced pressure, the residue was treated with Freon-113 (5 x 15 ml) and filtered through a 1.5 x 5 cm column of Woelm neutral alumina. The product (2.17 g, 47% yield) was distilled in vacuo giving the
20 desired 1, 5-bis(diphenylphospha)-3,7-bis[$C_3F_7OCF(CF_3)$]-2, 4, 6, 8-tetraazacyclooctatetraene (1.46 g, 31.5%); bp 138-139°C/0.001 mm Hg; mp 77.5-79°C.

10

The above 1,5-bis(diphenylphospho)-3, 7-bis
 $[C_3F_7OCF(CF_3)]$ -2,4,6,8-tetraazacyclooctatetraene was
 found to effectively inhibit oxidation of perfluoroalkylether
 fluids, e.g., fluids of the type disclosed in U.S. Patent
 3,393,151 and to prevent corrosion of various metals by these
 fluids. For example, a 1% by weight solution of this
 diphosphatetraazacyclooctatetraene decreased oxygen consumption
 to zero and volatile products formation by a factor of ≈ 17
 during a 24 hour exposure to oxygen at 600°F as compared to
 an identical treatment of the fluid in the absence of the
 additive. In addition, an M-30 coupon test surface in the
 presence of the additive appeared unchanged, whereas in the
 absence of any additive, under otherwise identical conditions,
 the surface becomes covered with deeply colored irregular
 deposits. These data are summarized below in Table I.

a) The apparatus consisted of a sealed glass tube wherein the metal coupon was suspended in the fluid; the test was conducted in pure oxygen; at the conclusion of the test, the oxygen was measured and the products were collected and measured. b) Percent of oxygen available. (c) Oxygen consumed in mg/g Krytox employed. d) Products formed in mg/g Krytox employed. e) The percent is weight percent of additive per weight of Krytox fluid.

Example II

Under nitrogen by-pass, a solution of the amidine, C₃F₇OCF(CF₃)CF₂OCF(CF₃)C(=NH)NH₂, (3.14 g, 6.36 mmol) and triethylamine (5.4 ml, 38.72 mmol) in Freon-113 (25 ml) was added dropwise over 28 min. to a solution of diphenyltrichlorophosphorane (3.86 g, 13.24 mmol) in benzene (25 ml) at 50°C. The resulting mixture was stirred at 50°C for 114 hr. After cooling, Freon-113 (75 ml) was added and the insoluble portion was removed by filtration. The concentrated filtrate was then refiltered through a 1.5 x 5 cm column of

Woelm neutral alumina giving 1,5-bis(diphenylphospha)-3,7-bis
 $[\text{C}_3\text{F}_7\text{OCF}(\text{CF}_3)\text{CF}_2\text{OCF}(\text{CF}_3)]$ -2,4,6,8-
 tetraazacyclooctatetraene as a viscous fluid.
