TABLES OF CYLINDRICAL BLAST FUNCTIONS
FOR $\gamma=5/3$ AND $\gamma=7/5$

ABSTRACT

Tables of similarity functions defining the flow field behind expanding cylindrical shock waves are presented here for $\gamma=5/3$ and $\gamma=7/5$. A brief discussion includes the differential equations and boundary conditions for these functions together with an analytical solution for them.

I DISCUSSION

Theoretical treatments have been given of the flow behind an expanding cylindrical shock wave produced by the instantaneous release of a finite amount of energy per unit length along a straight line of infinite extent.^(1, 2, 3) These analyses lead to ordinary differential equations for 'similarity functions'.

The notation of reference 1 will be used here. The similarity assumptions introduced into the differential equations for unsteady cylindrical flow of a perfect gas are:

$$\begin{aligned} \text{Density} & \quad \rho/\rho_0 = \psi(\eta) \quad ; \\ \text{Flow Velocity} & \quad u = A\phi(\eta) / R \quad ; \\ \text{Pressure} & \quad p/p_0 = \left(\frac{\rho_0}{\gamma p_0}\right) A^2 f(\eta) / R^2 , \end{aligned} \tag{1}$$

where R is the radius of the cylindrical shock wave; ρ_0 and p_0 are the density and pressure of the undisturbed gas ahead of the shock wave; $\eta = r/R$ is a non-dimensional variable; A is a constant (dependent on E , the energy released per unit length); and ψ , ϕ and f are functions of η only.

The following equations are obtained:

$$R \, dR/dt = A \quad (t = \text{time}) \tag{2}$$

$$f' = \frac{2\eta(\eta - \phi) + \gamma \phi^2}{f - (\eta - \phi)^2 \psi} \frac{(\psi f)}{\eta} \tag{3}$$

$$\phi' = \frac{f' - \gamma \psi \phi}{\gamma \psi (\eta - \phi)} \tag{3}$$

$$\psi' = \frac{(\eta \phi' + \phi) \psi}{(\eta - \phi) \eta}$$

and

$$E = 2\pi\rho_0 A^2 \int_0^1 \left[\frac{1}{\gamma(\gamma - 1)} f' + \frac{1}{2} \psi \phi^2 \right] \eta \, d\eta \tag{4}$$

The initial conditions for Equation (3) are (using strong shock assumption)

$$f(1) = 2\gamma/(\gamma + 1), \quad \psi(1) = (\gamma + 1)/(\gamma - 1), \quad \phi(1) = 2/(\gamma + 1), \quad (5)$$

where γ is the ratio of specific heats.

Equation (3) can be integrated numerically or else solved analytically by the implicit relationships given in [3] ; namely (with ϕ/η as the argument),

$$\eta = \frac{K_1 \left| \frac{\phi}{\eta} - \frac{1}{\gamma} \right|^{(\gamma-1)/(2\gamma)}}{\left| \frac{\phi}{\eta} \left(\frac{\phi}{\eta} - \frac{2}{\gamma} \right) \right|^{1/2}} \quad (6)$$

$$\psi = \left[\frac{(\gamma-1)}{2a} \eta \phi^2 \frac{(\eta-\phi)^2}{(\eta-\gamma\phi)} \right]^{-\frac{1}{\gamma-2}}$$

$$f = \frac{\gamma(\gamma-1)}{2} \frac{\phi^2(\eta-\phi)}{(\gamma\phi-\eta)} \psi$$

where K_1 and a are determined by the conditions

$$\phi(\eta = 1) = 2/(\gamma + 1), \quad \psi(\eta = 1) = (\gamma + 1)/(\gamma - 1) \quad (7)$$

Table I contains tabulations of ϕ , ψ and f as functions of η for $\gamma = 5/3$ (monatomic perfect gas). For this case

$$E = 2.257 \rho_0 A^2$$

For completeness, Table II is included with ϕ , ψ , and f for $\gamma = 1.4$, although tabulations of these functions appear in references 1, 2, and 3. (It should be noted that there are several numerical errors in reference 1.) For $\gamma = 1.4$

$$E = 3.94 \rho_0 A^2$$

The time - radial distance relation is

$$R = 1.154 \quad (E/\rho_0)^{1/4} t^{1/2}$$

for $\gamma = 5/3$, and

$$R = 1.004 \quad (E/\rho_0)^{1/4} t^{1/2}$$

for $\gamma = 7/5$.
