AWARD NUMBER: W81XWH-15-1-0354

TITLE: Neural correlates of the Y chromosome in autism: XYY Syndrome as Genetic Model

PRINCIPAL INVESTIGATOR: Timothy Roberts

CONTRACTING ORGANIZATION:

Children's Hospital of Philadelphia, Research Institute Philadelphia, PA 19104

REPORT DATE: September 2017

TYPE OF REPORT: Annual

PREPARED FOR: U.S. Army Medical Research and Materiel Command Fort Detrick, Maryland 21702-5012

DISTRIBUTION STATEMENT: Approved for Public Release; Distribution Unlimited

The views, opinions and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy or decision unless so designated by other documentation.

.14. ABSTRACT					
A multimodal MRI. MRS	S and MEG (magnetoe	encephalography) design i	s employed in cohorts of	boys with XYY.	who are symptomatic for ASD and control
cohorts of idiopathic AS	SD (ASD-I) and typical	development (TD). Target	ted recruitment for year 1	totaled 30 enrol	ed. At the point of this report, 25 subjects
have been enrolled, 5 v	vere eliminated for not	meeting inclusion criteria	upon clinical assessmen	it, 19 have compl	eted data acquisition, and 1 is pending
imaging completion. The	ree of the 19 are pend	aing confirmation of ASD d	agnosis. Several more a	are in various stat	ges of recruitment, scheduling,
8XYY+ASD, 1 ASD-I).	QA suggests in generation	al that complete studies ha	ave been tolerated and th	at data quality is	good in the majority of cases. Additional
steps to remove MEG t	rials corrupted by exce	essive head motion are un	derway to improve furthe	er the evaluable d	ata yield. Data analysis is ongoing, priority
having been given to st	andard approaches fo	r MEG (source localization	n in BESA followed by co	nsensus "peak" p	picking), MRS (alignment of "on" and "off"
spectra, then subtraction and Gaussian modeling of the GABA and Cr resonances in GANNET) and DTI/HARDI. As mentioned above, about 50% of the data					
tolerated this strategy robustly. The remaining data are undergoing "scrubbing" to eliminate motion-related artifacts and reduce noise, to accommodate comparable analysis – these data are likely evaluable, but are not reported berein. Dependent variable extraction is underway and preliminary data are shown					
for illustration of feasibility. It is premature to conduct formal statistical analyses. Recruitment, acquisition and analysis is on track and completion is anticipated					
in the remaining 12 months of this award.

1. INTRODUCTION

(Technical abstract from application): This proposal addresses two topics of great importance to the ASD community: mechanisms of heterogeneous clinical expression of ASD and mechanisms underlying conditions co-occurring with ASD, including seizures, attention, and anxiety disorders. Autism affects ~1% of the population (4:1 male pre-dominance) and is heterogeneous with regard to etiological/risk factors, pathogenesis, and clinical presentations. Heritability studies have shown that genetic factors are important in ASD, but dissecting out the relationships among genes, imaging biomarkers, and behavioral phenotypes of ASD is confounded by both genetic heterogeneity and the paucity of neurobiological models. These problems can be circumvented by studying genetically defined ASD subgroups such as 47.XYY syndrome (XYY). XYY occurs in ~0.1% of the male population but has been reported in up to 1% of males with ASD. Approximately 33% of males with XYY satisfy diagnostic criteria for ASD (XYY+ASD). The behavioral and neuroimaging biomarkers of XYY+ASD identified in our preliminary studies overlap with those described in ASD-I and, similarly, comorbidities (seizures, attention, and anxiety disorders) exhibited in XYY+ASD are representative of those described in ASD-I. In this proposed study, we will examine the behavioral, neurophysiological and neuroimaging markers of ASD, and specifically compare the variance (heterogeneity) of these measures in XYY+ASD versus ASD-I. Having established the level at which XYY+ASD confers imaging/phenotypic heterogeneity reduction, the mechanism underlying these measures will be probed via neurochemical magnetic resonance spectroscopy of key neurotransmitters and myelin mapping. Clinically meaningful associations between such measures and behavioral ASD phenotypes will be identified.

A multimodal MRI, MRS and MEG (magnetoencephalography) design is employed in cohorts of boys with XYY, who are symptomatic for ASD and control cohorts of idiopathic ASD (ASD-I) and typical development (TD).

Autism spectrum disorder, ASD 47,XYY syndrome (XYY) Neuroimaging MRI MEG Comorbid behaviors

3. ACCOMPLISHMENTS

What were the major goals of the project?

Major Task 1: Regulatory review and approval processes for studies involving human subjects at 2 sites (CHOP and Nemours/DuPont).

Major Task 2: Recruitment

Major Task 3: Data Acquisition

Major Task 4: Data Analysis

What was accomplished under these goals?

Major Task 1: Regulatory review and approval processes for studies involving human subjects at 2 sites (CHOP and Nemours/DuPont Hospital for Children).

All study protocols have been submitted reviewed and approved by both local IRB's (CHOP / Nemours/DuPont Hospital for Children) as well as central DoD ethics review. Furthermore, since the co-PI Dr. Judith Ross moved to Nemours/DuPont Hospital for Children prior to commencement of this grant funding, approval was obtained by Nemours/DuPont Hospital for Children and all materials were reviewed by DoD. Where appropriate continuing renewal submissions have been submitted and approved in a timely fashion.

Major Task 2: Recruitment

Recruitment for year 2 totaled 46 enrolled (out of a target of 60). 11 were eliminated for not meeting inclusion criteria upon clinical assessment, namely XYY subjects not meeting clinical ASD criteria. While these are, by inclusion criteria, not consistent with the goals of the written grant proposal, we found them to be a highly relevant control group and have indeed included them in the protocol (under separate funding). Several more are in various stages of recruitment, scheduling, neuropsychological evaluation or imaging, under the goals of the no-cost extension.

Group	Ν
TD	16
XYY+ASD	13
ASD-I	6
XYY not meeting inclusion criteria (Enrolled but not evaluable)	11

Major Task 3: Data Acquisition

MRI, MRS and MEG examinations have been conducted in the 46 subjects above with confirmed diagnoses (16TD, 13XYY+ASD, 6 ASD-I). QA continues to suggest that imaging protocols have been tolerated and that data quality is good in the majority of cases. Additional steps are being investigated to further improve evaluable data yield, via the removal of artifacts such as excessive head motion during MEG or DTI acquisitions and frequency drift during MR spectroscopy experiments.

Major Task 4: Data Analysis

Data analysis is ongoing, priority having been given to standard approaches for MEG (source localization in BESA followed by consensus "peak" picking), MRS (alignment of "on" and "off" spectra, then subtraction and Gaussian modeling of the GABA and Cr resonances in GANNET) and DTI/HARDI. As mentioned above, about 50% of the data tolerated this strategy robustly. The remaining data are undergoing "scrubbing" to eliminate motion-related artifacts and reduce noise, to accommodate comparable analysis – these data are likely evaluable, but are not reported herein.

As suggested during the DoD scientific review process we have included, where possible, data acquired from additional subjects (notably an XYY-ASD cohort – see major task 2) acquired under other projects. While full statistical analysis is premature, where appropriate some preliminary statistics are presented.

Preliminary Analysis and Trend Observation of Dependent Variables acquired under Major Task 3 and Analyzed in Major Task 4:

Fig. 1a MEG recorded auditory evoked field source waveforms from right hemisphere Heschl's gyrus in a representative 17-year old with typical development (blue) vs. an XYY participant on the autism spectrum (XYY+ASD), who exhibits a profound delay in the M100 peak (arrows).

Fig. 1b **M100 Latency Prolongation in XYY**. Linear mixed models (Main effects of hemisphere, XYY and ASD status with age and NVIQ as covariates), Found significant (P<0.01) delays (24ms Full model, 39msLeft hemisphere) in XYY. While failing to reach significance a 12ms delay in right M100 was observed in ASD).

M100 Effects	Full Model	Left Hemisphere	Right Hemisphere
ХҮҮ	+24ms	+39ms	+10ms
ASD	+12ms	+1 <i>ms</i>	+12ms

Fig. 1c Age dependence of M50 latency in XY-ASD (red), XY+ASD (blue), XYY+ASD (green) and XYY-ASD (purple) shows maturational trajectory towards shortening (as has been previously reported in both TD and ASD-I). Note that, similar to fig1b, genetic effects on latency (XYY prolongation) are more pronounced in the left hemisphere.

Fig. 2. Gamma band (30Hz-60Hz) phase locking value measured from the right auditory evoked response shows the expected maturational trajectory of increasing gamma synchrony with age. Similar relationships are visible in Left auditory phase locking (not shown)

Fig. 3a High Angular Resolution Diffusion Imaging (HARDI) allows depiction of the thalamocortical projections of the white matter auditory pathway – the acoustic radiations (red) without the confounds of fiber crossing and complex white matter architecture that limit typical DTI. These masked regions can then be interrogated to reveal parameters (e.g. fractional anisotropy, FA, and mean diffusivity, MD, associated with local white matter microstructure.

Fig. 3b Interrogating a HARDIdefined mask in the left acoustic radiation shows an anticipated maturational trend towards increasing fractional anisotropy (FA) in each group except (XY+ASD) – it is premature to assess Group differences in the slope of this trajectory. Analogous data (not shown) show maturational trajectories for the right hemisphere acoustic radiations and for mean diffusivity.

Fig. 3b The GABA resonance in the raw subtracted spectrum (blue) is fit with a single Gaussian resonance (red) using GANNET (right, upper). The integral of this fit is then normalized to the intrinsic Cr resonance at 3ppm in the unsubtracted spectra (right, lower).

Fig. 3c The GABA/Cr ratio (obtained from ROI's in both left (upper) and right (lower) STG shows a consistently diminished level of GABA in XYY+ASD versus TD (as has been reported in ASD-I).

2.6

Medical and Psychiatric diagnoses or clinically significant findings	XYY+ASD (n=8)	TD (n=8)	Childhood Prevalence	Prevalence in ASD-I
FEATURES				
Hypotonia	7 (88%)	0		51%
Tremor	2 (25%)	0	0.1 - 22%	
MEDICAL DIAGNOSES				
Motor Delay/Dyspraxia	6 (75%)	0	< 5%	34%
Seizures	0	0	1%	14-35%
PSYCHIATRIC				
DIAGNOSES				
ADD or ADHD	5 (63%)	0	2 – 16%	28%
Verbal or Motor Tic	2 (25%)	0	5 – 10%	9%
Oppositional Defiant	4 (50%)	0	1 – 16%	30%
Depression	2 (33%)	0	<1%	1.4%
Anxiety	6 (75%)	0	15 – 20%	42%
Bipolar/mood disorder	1 (13%)	0	0.4 - 6.3%	26%

Table 2. Co-morbidities associated with XYY+ASD

Table 2. XYY is associated with significant occurrence of co-morbid behaviors/diagnoses. Although stratified analyses is premature, a later goal of this study is to identify neural features relating to such behaviors

<u>What opportunities for training and professional development has the project</u> <u>provided?</u>

Nothing to report

How were the results disseminated to communities of interest?

Initial analysis were presented at the recent International Meeting for Autism Research (*Structural and Functional Characteristics of XYY - Relationship to ASD*, *L. Bloy et al, IMFAR, 2017*).

Additionally two papers are currently being prepared for submission. The first, titled *"Auditory Evoked Response Delays in Children with 47,XYY syndrome"* presents the M50 and M100 findings. The second, a case report titled *"NLGN4Y copy number variations and neurocognitive/autism phenotypes: Behavioral Phenotype In Male With XYY and absent NLGN4Y Expression"* discusses the behvioral and neuroimaging phenotype of an individual with 47,XYY who is missing the NLGN4Y gene.

What do you plan to do during the next reporting period to accomplish the goals?

Continue / complete recruitment, acquisition and analysis. Perform statistical analyses and prepare manuscripts.

4. IMPACT

What was the impact on the development of the principal discipline(s) of the project? - Nothing to report yet

What was the impact on other disciplines? - Nothing to report yet

What was the impact on technology transfer? - Nothing to report yet

What was the impact on society beyond science and technology? - Nothing to report yet

5. CHANGES/PROBLEMS

Changes in approach and reasons for change - none

Actual or anticipated problems or delays and actions or plans to resolve them

Although there have been no significant problems encountered and no study design changes made, at present we are currently behind our enrollment targets. For this reason, in June we requested and were granted a 12 month No-Cost Extension extending the project completion date to 8/14/2018. Given this extra time and our current recruitment rates we are confident that we will reach our enrollment target by the end of the project.

Changes that had a significant impact on expenditures - none

Significant changes in use or care of human subjects, vertebrate animals, biohazards, and/or select agents – none

6. PRODUCTS

Publications, conference papers, and presentations - none yet

Website(s) or other Internet site(s) - none

Technologies or techniques - none

Inventions, patent applications, and/or licenses - none

Other Products – none

7. PARTICIPANTS & OTHER COLLABORATING ORGANIZATIONS

What individuals have worked on the project?

No change: Roberts, Miller, Bloy, Ross

Has there been a change in the active other support of the PD/PI(s) or senior/key personnel since the last reporting period?

See appended current "Other Support" documentation from Drs. Roberts and Ross.

What other organizations were involved as partners?

Nemours / Dupont Hospital for Children

8. SPECIAL REPORTING REQUIREMENTS: None

9. APPENDICES: None
