13. SUPPLEMENTARY NOTES					
14. ABSTRACT Hepatocellular carcinoma (HCC) is the 6 th most common cancer and 3 rd leading cause of cancer-related death worldwide. We know that HCC subtypes exist because clear clinical, radiographic, and histological differences between patients with HCC are observed. In this study we proposed to investigate distinct subtypes of HCC using a mouse-human chimeric <u>P</u> atient <u>D</u> erived <u>X</u> enograft (PDX) approach. So far, we have performed a large effort to implant 102 tumors from human HCC patients from Texas. We have established the protocol and the results have taught us that engraftment using a variety of transplantation techniques will result in a 25-30% engraftment efficiency for early stage surgical tumors. We have established 6 new human HCC PDX models that will be highly relevant for therapeutic and biological studies. These represent North American HCCs, including some patients with intermediate/advanced stage HCC, which is a unique resource for the field.					
15. SUBJECT TERMS HCC, patient derived xenografts, siRNA, mouse models of cancer .

1. INTRODUCTION:

Hepatocellular carcinoma (HCC) is the 6th most common cancer and 3rd leading cause of cancer-related death worldwide. In the US, its incidence has doubled over the past two decades due to the growing number of patients with hepatitis C virus (HCV) and/or non-alcoholic steatohepatitis (NASH) (El-Serag, 2004, 2012). We know that HCC subtypes exist because clear clinical, radiographic, and histological differences between patients with HCC are observed (Yopp et al., 2015). In this study we proposed to investigate distinct subtypes of HCC using a mouse-human chimeric Patient Derived Xenograft (PDX) approach. We aim to analyze and functionalize early and advanced stage HCC tumors with a large and representative cohort of patient derived xenograft (PDX) models. Our hypothesis is that HCC is poorly understood because tissue has been obtained from early HCC but not advanced cases. Biological subclasses of HCCs that behave differently in terms of natural history, prognosis and treatment response have not been categorized and/or functionally analyzed. Our team will use human-mouse PDX models to uncover novel biology and establish a platform to study experimental therapeutics.

2. KEYWORDS:

HCC, patient derived xenografts, siRNA, mouse models of cancer.

3. ACCOMPLISHMENTS: The PI is reminded that the recipient organization is required to obtain prior written approval from the awarding agency Grants Officer whenever there are significant changes in the project or its direction.

What were the major goals of the project?

For reference, the complete Statement of Work (SOW) is presented below with detail of Aims, Major Tasks, and Subtasks with Anticipated time lines. The column titled “Progress” indicates portion of the Major Task and related Sub-tasks completed.

Site 1:	UT Southwestern Medical Center	Site 2:	Ann Arbor Veterans Affairs Healthcare System
	5323 Harry Hines Blvd		2215 Fuller Rd
	Dallas, TX 75390		Ann Arbor, MI 48105
	Initiating PI: Dr. Hao Zhu Partnering PIs: Drs. Amit Singal; Adam Yopp; Daniel Siegwart		Partnering PI: Dr. Waljee

Specific AIM 1: Determine if early vs. advanced HCCs have distinct cell-intrinsic biology in PDX engraftment assays	Timeline in months	Site 1 (Initiating PI)	Site 2 (Partnering PI)	Progress (Percent Complete or Completion Date)
Major Task 1: Expand and characterize PDX models derived from surgical and biopsy HCC specimens				
Pre-task: Allow time to receive the regulatory approval for animal use (IACUC and DoD ACURO)	1-3	Drs. Yopp, Singal, and Zhu		100 % complete November 2016
Pre-task 2: Allow time to receive the regulatory approval for the Human Anatomical Substance use (IRB and DoD HRPO).	1-3	Drs. Yopp, Singal, and Zhu		100 % complete November 2016
Subtask 1: Continue to implant 40 surgical HCC specimens in the subcutaneous space and livers of NSG mice	0-12	Drs. Yopp and Zhu		100% complete Sep 2018
Subtask 2: Continue to implant 25 biopsy samples from intermediate and advanced HCC cases in the subcutaneous space and livers of NSG mice	0-12	Drs. Yopp, Singal, and Zhu		100% complete Sep 2018
Subtask 3: Harvest primary PDX tumors, establish PDX bank, and passage into additional NSG mice	6-18	Drs. Yopp and Zhu		100% complete Oct 2018
Subtask 4: Characterize tumor architecture, histology, growth, invasiveness, and paraneoplastic features of tumors that engraft, and determine if the grafts resemble or deviate from original tumors (surgical or biopsy specimens)	6-24	Drs. Yopp and Zhu		100% complete Sept 2018
Subtask 5: Obtain genomic data from PDX grafts to determine if they resemble or deviate from original tumors (surgical or biopsy specimens)	12-30	Drs. Yopp, Singal, and Zhu		100% complete June 2018
Major Task 2: Compare biological and genetic features (stage, survival, progression) of early vs. non-early HCCs				
Subtask 1: Compare biological features of the tumors that engraft vs. those that do not, and determine if there is a difference between PDX made from early surgical or more advanced biopsy specimens	6-24	Drs. Yopp and Zhu		70% complete Oct 2018

Subtask 2: Compare patient clinical features (stage, survival, progression) of specimens that engraft versus not engraft and determine if engraftment can predict clinical outcomes	6-18	Drs. Singal,	Drs. Wajlee	40% complete October 2018
Subtask 3: Analyze genomic data to survey genetic landscape of PDX population that successfully engrafts and identify genetic drivers of engraftment	12-36	Drs. Singal and Zhu	Drs. Wajlee	80% complete October 2018
<i>Milestone #1: Co-author manuscript on biology and genomics of HCC PDX models</i>	12-24	Drs. Zhu, Singal, and Yopp	Drs. Wajlee	60% complete Oct 2018
Specific AIM 2: Determine the efficacy of small RNA therapeutics against the <i>LIN28B/LET-7</i> pathway in PDXs activating this oncogenic pathway	Timeline	Site 1 (Initiating PI)	Site 2 (Partnering PI)	
Major Task 1: Identify and deliver small RNAs to target PDX populations				
Subtask 1: Evaluate and optimize custom dendritic nanoparticle delivery to PDX tumors	0-12	Drs. Zhu and Siegwart		
Subtask 2: Formulate and optimize siRNA and microRNA containing dendritic nanoparticles to ensure that successful modulation of LIN28B and or LET-7 is achieved in PDX models.	6-24	Dr. Siegwart		
Subtask 3: Define HCC PDX models that overexpress MYC or LIN28B and those that suppress LET-7 family microRNAs	6-24	Drs. Singal and Zhu		
Subtask 4: Therapeutically deliver siRNAs or microRNAs in dendritic nanoparticles to mice harboring these PDX models	12-36	Dr. Siegwart		
Major Task 3: Define response to small RNAs in target PDX populations				
Subtask 1: Determine response to small RNA therapies using luciferase and CT imaging	6-30	Dr. Siegwart		
Subtask 2: Define histological response and intermediate markers of tumor biology (Ki67, apoptosis, necrosis)	12-36	Dr. Siegwart		
<i>Milestone #2: Co-author manuscript about therapeutic efficacy of small RNA therapy in HCC PDX models</i>	24-36	Drs. Zhu and Siegwart		

Specific AIM 3: Define targeted therapy responders with HCC-PDX patient avatars and use to identify predictive biomarkers	Timeline	Site 1 (Initiating PI)	Site 2 (Partnering PI)	
Major Task 1: Define PDX models that show partial response, stable disease, and progressive disease to targeted therapies				
Subtask 1: Characterize tumors for growth, histology, vascular invasion, metastasis, proliferation and apoptosis after treatment	12-36	Drs. Zhu, Yopp, and Singal		100% complete Oct 2018
Subtask 2: Perform exome and RNA-expression sequencing for top responders and non-responders for each group to determine mechanistic basis of response	18-36	Drs. Singal and Zhu	Dr. Waljee	50% complete Oct 2018
Major Task 2: Establish predictive biomarkers for response to treatment				
Subtask 1: Use machine learning methods to identify clinical and genetic factors associated with response to targeted therapies	18-36	Drs. Yopp, and Singal	Dr. Waljee	100% complete Oct 2018
Subtask 2: Derive and internally validate predictive model using factors significantly associated with targeted therapy response	24-36	Dr. Singal	Dr. Waljee	
Milestone #3: Co-author manuscript on HCC PDX treatments and predictive modeling results	24-36	Drs. Zhu, Yopp, and Singal	Dr. Waljee	

What was accomplished under these goals?

Specific AIM 1: Determine if early vs. advanced HCCs have distinct cell-intrinsic biology in PDX engraftment assays
Major Task 1: Expand and characterize PDX models derived from surgical and biopsy HCC specimens
Subtask 1: Implant surgical HCC specimens in the subcutaneous space and livers of NSG mice. This task has been completed, and Drs. Yopp and Zhu were responsible for this work. We have now implanted over 80 surgically obtained primary human HCC tumors into immunodeficient mice. This is a large number of patients and thus we can now make solid conclusions about the efficiency of PDX modeling for HCC. The data was shown in the previous progress report.
Subtask 2: Continue to implant 25 biopsy samples from intermediate and advanced HCC cases in the subcutaneous space and livers of NSG mice. This is the responsibility of Drs. Yopp, Singal, and Zhu. We have 6 engrafted biopsy samples that grew out from total of 26 implanted biopsies. The biopsy engraftment rate is less efficient than the surgical engraftment rate, but we cannot conclude that the advanced HCCs obtained via biopsy are less efficient engrafters than surgical samples because there is less tumor starting

material. This subtask has been completed as of 7-1-18.

Subtask 3: Harvest primary PDX tumors, establish PDX bank, and passage into additional NSG mice. This has been performed by Min Zhu and Lin Li under the supervision of Drs. Yopp and Zhu. This task has been completed as was reported in the last progress report. Following is an updated table describing how long it takes from implantation to engraftment and passage. Enclosed are passageable lines.

Subtask 4: Characterize tumor architecture, histology, growth, invasiveness, and paraneoplastic features of tumors that engraft, and determine if the grafts resemble or deviate from original tumors (surgical or biopsy specimens). We have found that 26 of 33 engrafted tumors have strong resemblance to the original HCC or cholangiocarcinoma tumors as based on Histology. Representative data was shown previously. This subtask is complete.

Subtask 5: Obtain genomic data from PDX grafts to determine if they resemble or deviate from original tumors (surgical or biopsy specimens). This has been performed under the supervision of Drs. Yopp, Singal, and Zhu. We have performed RNA-seq and whole exome DNA sequencing. There is good concordance between primary tumor and PDX tumor for RNA-seq, which measures the mRNAs expressed in the tumors vs. PDX models. See below for Principle component analysis showing that the primary patient tumors and PDX models general match in terms of mRNA expression. This confirms that there is gene expression program stability even after growth of tumors in immunodeficient mouse models.

We also compared the DNA sequencing data of the patient tumors and the PDXs. We found many shared somatic mutations between patient tumor and PDX samples. The figure

below shows the variant allele frequency of conserved mutations in patient tumors and their corresponding PDX models. We are still doing analysis for this question.

Major Task 2: Compare biological and genetic features (stage, survival, progression) of early vs. non-early HCCs

Subtask 1: Compare biological features of the tumors that engraft vs. those that do not, and determine if there is a difference between PDX made from early surgical or more advanced biopsy specimens

This has been performed under the supervision of Drs. Yopp, Singal, and Zhu. We have not identified a clear difference in Ki67 marked cell proliferation between the tumors that engraft vs. those that do not engraft. We also examined engraftment and tumor differentiation grade, which had previously been associated with engraftment in PDX models. The following is the table of comparing the engraftment rate among tumors with different grades. Biopsies and surgical samples were analyzed separately. No significant differences were observed, although admittedly there is a trend toward improved engraftment with higher grade and lower differentiation. We previously hypothesized that more advanced cancers (which are generally biopsied for tissue) might have higher egraftment or growth rates, but we found no evidence that biopsies have a higher engraftment rate than the surgical specimens. For surgical HCC samples, there seems to be a slightly higher engraftment rate for the poorly vs. moderately differentially tumors. The number of cases of well differentiated tumors is small so these numbers are not conclusive.

Type	Grade	implanted	PDX-yes	lymphoma	HCC-PDX	HCC-PDX /Total	transplantable HCC-PDX	ID

	poor	1	1	0	1	37.50%	1	CCA-HS131
	total	6	2	0	2	33.30%	2	

Type	Grade	total cases implanted	PDX-yes	lymphoma	CCA-PDX	CCA-PDX /Total	transplantable CCA-PDX	ID
CCA Biopsy	moderate	2	1		1	50.00%	1	CCA-HB163
	total	2	1	0	1	50.00%	1	

Subtask 2: Compare patient clinical features (stage, survival, progression) of specimens that engraft versus not engraft and determine if engraftment can predict clinical outcomes

Dr. Waljee's team performed explanatory analyses to find association between PDX engraftment results and several clinical features. We identified that one of the potential clinical predictors for engraftment is the size of the tumor with a coefficient of 0.2369, which was significant (p-value<0.05). Otherwise there were no clear correlations.

Subtask 3: Analyze genomic data to survey genetic landscape of PDX population that successfully engrafts and identify genetic drivers of engraftment

Dr. Waljee's team considered a variety of gene selection methods, including (1) logistic regression model with lasso regularization, (2) logistic regression model with elastic net regularization, (3) nearest shrunken centroid (NSC) method, and (4) adaptive hierarchically penalized NSC (AHP-NSC). The results are shown in table 1. The logistic regression model with lasso penalty method resulted in the highest accuracy rate of 76%. We also identified several genes that can potentially drive engraftment: SNORD15B; SNORA53; RP11-182J1.5; ZNF205; CX3CL1; RP5-837J1.1; MFSD9; SCARNA5; RAB3B

Method	Accuracy rate
--------	---------------

(1) logistic regression model with lasso	0.76
(2) logistic regression model with elastic net	0.74
(3) NSC	0.60
(4) AHP-NSC	0.64

We will further study how genomic data can predict engraftment by taking three important known clinical confounders into consideration.

Milestone #1: Co-author manuscript on biology and genomics of HCC PDX models

The manuscript is being written and we plan on submitting to Hepatology.

Subtask 1: Compare biological features of the tumors that engraft vs. those that do not, and determine if there is a difference between PDX made from early surgical or more advanced biopsy specimens

We have not identified difference in Ki67 marked proliferation between the tumors that engraft vs. those that do not. We will examine differentiation and grade of tumors next.

Specific AIM 2 (Determine the efficacy of small RNA therapeutics against the LIN28B/LET-7 pathway in PDXs activating this oncogenic pathway).

Major Task 1: Identify and deliver small RNAs to target PDX populations

Subtask 1: Evaluate and optimize custom dendritic nanoparticle delivery to PDX tumors

This has been completed.

Subtask 2: Formulate and optimize siRNA and microRNA containing dendritic nanoparticles to ensure that successful modulation of LIN28B and or LET-7 is achieved in PDX models.

Ongoing 5A2-SC8 synthesis has been performed and completed. We anticipate that this will be enough for 9-12 months of animal experiments.

Subtask 3: Define HCC PDX models that overexpress MYC or LIN28B and those that suppress LET-7 family microRNAs

We did not do work on this task this period.

Subtask 4: Therapeutically deliver siRNAs or microRNAs in dendritic nanoparticles to mice harboring these PDX models

We did not work on this task during this period.

Major Task 3: Define response to small RNAs in target PDX populations

Subtask 1: Determine response to small RNA therapies using luciferase and CT imaging

Subtask 2: Define histological response and intermediate markers of tumor biology (Ki67, apoptosis, necrosis)

Specific AIM 3: Define targeted therapy responders with HCC-PDX patient avatars and use to identify predictive biomarkers

Major Task 1: Define PDX models that show partial response, stable disease, and progressive disease to targeted therapies

Subtask 1: Characterize tumors for growth, histology, vascular invasion, metastasis, proliferation and apoptosis after treatment

We have performed drug studies in the PDX models that are growing well after passage into multiple recipient NSG mice. We started with using Regorafenib, a relatively new second line agent in HCC. This

drug is used after patients progress or cannot tolerate first-line therapy, i.e. sorafenib. We aimed to find out if there are subsets of HCCs that are more responsive to Regorafenib. Each PDX line was expanded in mice and separated into two groups. One group was treated with vehicle and one treated with Regorafenib. We found that 4 of the lines responded well after treating with Regorafenib. We plan to treat these PDX lines with other drugs and compare the results with Regorafenib. Interestingly, some of the most sensitive lines are cholangiocarcinomas that are not traditionally treated with multi-kinase inhibitors. This suggests that Regorafenib or other multikinase inhibitors could be effective in mixed type histology or biliary cancers. Notably, mixed type cancers that contain both HCC and cholangiocarcinoma components are difficult to treat and it is uncertain what the best systemic options are.

A.

B.

C.

D.

E.

We are also examining other compounds such as sorafenib and other sorafelogs in comparison with regorafenib.
Subtask 2: Perform exome and RNA-expression sequencing for top responders and non-responders for each group to determine mechanistic basis of response
Major Task 2: Establish predictive biomarkers for response to treatment
Subtask 1: Use machine learning methods to identify clinical and genetic factors associated with response to targeted therapies
Subtask 2: Derive and internally validate predictive model using factors significantly associated with targeted therapy response
Milestone #3: Co-author manuscript on HCC PDX treatments and predictive modeling results We are working on this.

What opportunities for training and professional development has the project provided?

Min Zhu presented some of her work in our departmental retreat, where she gave a 20 minute presentation.
--

How were the results disseminated to communities of interest?

Nothing to report

What do you plan to do during the next reporting period to accomplish the goals?

We are going to use the data generated above to co-author a manuscript on biology and genomics of HCC PDX models from western populations. This could be informative because there are only three published experiences with HCC PDX models, all of which are derived from Asian non-cirrhotic hepatitis B patients who underwent curative resection (Huynh et al., 2007; Wei et al., 2014; Yan et al., 2013). These models do not represent the US HCC population, in whom >70% have HCV or NASH and >90% have cirrhosis. In this study, we have established protocols for HCC PDX development for a large number of American patients. We found that the engraftment and passageability of HCCs is relatively inefficient, but that certain recipient protocols can increase efficiency. We have also found that HCC biopsies can generate PDX models. These HCC ODXs represent the patient spectrum in the US. This knowledge will help elucidate mechanisms of treatment response to currently available as well as experimental therapeutics.

We will also be performing HCC organoid development to increase the approaches that we can use to generate functional human models of primary liver cancer. Please see below for how we addressed this.

We will also work more towards targeting the Lin28 let-7 pathway in HCC PDX models, which is a part of AIM 2.

For Specific AIM 3 (Define targeted therapy responders with HCC-PDX patient avatars and use predictive modeling to identify prognostic biomarkers), we did drug studies in the PDX models that are successfully growing. We started with using Regorafenib, which is a new second line agent in HCC. This drug is used after patients progress or cannot tolerate first-line therapy, i.e. sorafenib. We aimed to know if there are subsets of HCCs that are more responsive to Regorafenib. Each PDX line was expanded in mice and separated to two groups. One group was treated with vehicle and one treated with Regorafenib. We found that 4 of the lines responded well after treating with Regorafenib. We plan to treat these PDX lines with other drugs and compare the results with Regorafenib. We're in the process of treating the PDX lines with sorafenib and a novel derivative of sorafenib developed by our collaborator at Mt. Sinai.

4. **IMPACT:** Describe distinctive contributions, major accomplishments, innovations, successes, or any change in practice or behavior that has come about as a result of the project relative to:

What was the impact on the development of the principal discipline(s) of the project?

The major impact at this point is that we have performed a large effort to implant 102 tumors from human HCC patients from Texas. We have established the protocol and the results have taught us how efficient this process will be. We have established 6 new human HCC PDX models that will be highly relevant for therapeutic and biological studies. These represent North American HCCs, including some patients with intermediate/advanced stage HCC, which is a unique resource for the field.

We have found that increasing the rate of engraftment with partial hepatectomy or mouse models of chronic liver disease helps to make the growth and engraftment of the tumors more efficient.

What was the impact on other disciplines?

Nothing to report

What was the impact on technology transfer?

Nothing to report

What was the impact on society beyond science and technology?

Nothing to report

5. **CHANGES/PROBLEMS:** The Project Director/Principal Investigator (PD/PI) is reminded that the recipient organization is required to obtain prior written approval from the awarding agency Grants Officer whenever there are significant changes in the project or its direction. If not previously reported in writing, provide the following additional information or state, "Nothing to Report," if applicable:

Changes in approach and reasons for change

Site 2 (PI: Waljee)

•Due to limited server analytic capabilities on the VA network, an amendment to the analysis plan was reviewed and approved in April, 2018 by Ann Arbor R&D committee. This amendment would allow de-identified data from Site 1 to be analyzed on the University of Michigan servers. A Data Sharing and Use Agreement was initiated and executed on 5/2/2018 between UTSW and University of Michigan. Data was transferred from UTSW on 7/11/2018 via DropBox

The postdoc research fellow listed on the UM Subaward left for personal reasons in December 2017. We hired another postdoc research fellow in September 2018 to perform the work in 14 months, using 8 months at 100% effort (12 calendar months) and then back to 50% effort (6 calendar months) for the remaining 6 months. We are confident that this will not impact the achievement of aims stated in the Statement of Work.

Actual or anticipated problems or delays and actions or plans to resolve them

Describe problems or delays encountered during the reporting period and actions or plans to resolve them.

Site 1:

Given low PDX engraftment rates and long waiting times, we have not generated as many human cancer lines as we were hoping to. Thus, we have also been generating in vitro liver cancer organoid models in addition to in vivo PDX models. These are primary liver tumors grown in culture that can be passaged over time. In other tumor types, these have been shown to recapitulate the histology, gene expression, behavior of primary HCCs from patients. In theory, this could have increased the number of patients that could be represented in the laboratory environment and expand our ability to test hypotheses and reach conclusions. We have had some incomplete success with these organoids over the last 6 month period. We believe that we have established the appropriate procedures and protocols to generate organoids, but still the rate of passageable lies is less than 10%.

We have been examining why we have such a low rate of organoid and PDX engraftment/initiation. Recently, there was a Cell Reports paper showing that using a similar protocol as ours, they had 10/37 HCC biopsies grow successfully into organoids that are passageable. The only clinical variable that was predictive was Edmonson differentiation grade of 3. Their paper had 27/37 grade 3 or 4 HCCs (73%), and of the 27, only 10 grew out, indicating that if you are grade 3 or 4, you may not grow, but if you do form an organoid, then you definitely have to be grade 3 or 4. In our experiences with organoids, we had only 7 out of 50 patients were grade 3 or 4 (14%). As you might predict, this leads to a very low level of organoid formation or PDX engraftment. For us, maybe 2-3 of the 7 patients resulted in passageable organoids. This data could explain a lot about our efforts to functionalize human patient samples. It also might reflect our high level of indolent patients. This is quite interesting and important because indolence is a potential feature of HCC in the western world, and there has been little done to examine indolence in this population. Thus, we are both looking into indolence from a clinical research perspective, and we are focusing more on generating organoids from higher grade, lower differentiation patients.

Changes that had a significant impact on expenditures

Nothing to report

Significant changes in use or care of human subjects, vertebrate animals, biohazards, and/or select agents**Significant changes in use or care of human subjects**

Nothing to report.

Significant changes in use or care of vertebrate animals.

We renewed our animal protocol this October. It was essentially unchanged and it was approved.

Significant changes in use of biohazards and/or select agents

Data or databases: We continue to collect patient data in a clinical database.
Biospecimen collections: We have a human HCC biospecimen and PDX collection.
Research material: We have established live mice carrying human HCC PDXs.

7. PARTICIPANTS & OTHER COLLABORATING ORGANIZATIONS

What individuals have worked on the project?

Name: Hao Zhu

Project Role: Lead PI

Researcher Identifier (e.g. ORCID ID): 0000-0002-8417-9698

Nearest person month worked: 24

Contribution to Project: Direct the project, design the experiments and objectives, organize personnel, report progress to the DOD.

Name: Lin Li

Project Role: Senior Research Associate

Researcher Identifier (e.g. ORCID ID): none

Nearest person month worked: 24

Contribution to Project: implantation of HCC specimens, passage of engrafted PDXs, storage of PDX engrafts.

Name: Daniel Siegwart

Project Role: Co-PI

Researcher Identifier (ORCID ID): 0000-0003-3823-1931

Nearest person month worked: 24

Contribution to Project: Co-planned and co-directed research activities. Worked on 5A2-SC8 synthesis and purification. Worked on nanoparticle delivery optimization to liver tumors.

Name: Qiang Cheng

Project Role: Senior Research Associate

Researcher Identifier (e.g. ORCID ID): none

Nearest person month worked: 24

Contribution to Project: Developed nanoparticle delivery carriers with an improved ability to deliver RNAs to the liver. Assisted with 5A2-SC8 experiments.

Name: Adam Yopp

Project Role: Co-PI

Researcher Identifier (e.g. ORCID ID):

Nearest person month worked: 24

Contribution to Project: Design and conducted experiments, participated in co-PI conference calls to organize personnel and direct project.

Name: Min Zhu

Project Role: Senior Research Associate

Researcher Identifier (e.g. ORCID ID): none

Nearest person month worked: 24

Contribution to Project: implantation of HCC specimens, passage of engrafted PDXs, storage of PDX engrafts. inventory of HCC samples, preparation of genomic DNA libraries from HCC samples, data analysis, etc.

Name: Amit Singal

Project Role: Co-PI

Researcher Identifier (e.g. ORCID ID): 0000-0002-1172-3971

Nearest person month worked: 24

Contribution to Project: Design experiments, participated in co-PI conference calls to organize personnel and direct project.

Name: Veronica Renteria

Project Role: Research coordinator

Researcher Identifier (e.g. ORCID ID): none

Nearest person month worked: 24

Contribution to Project: collection of HCC specimens

Name: Amanda Ellis

Project Role: Research assistant

Researcher Identifier (e.g. ORCID ID): N/A

Nearest person month worked: 2.4

Contribution to Project: Ms. Ellis has performed administrative duties such as organizing meetings, regulatory policies, and served as liaison between AAVA and UTSW.

Name: Gunwoong Park

Project Role: Statistician

Researcher Identifier (e.g. ORCID ID): N/A

Nearest person month worked: 1.6

Contribution to Project: Implemented a cutting-edge prediction model in R that would handle data coming from a mixture of heterogeneous populations and he has also done numerous simulation studies comparing his implementation with several existing more traditional models.

Name: Xianshi Yu

Project Role: Statistician

Researcher Identifier (e.g. ORCID ID): N/A

Nearest person month worked: 1

Contribution to Project: Will be helping predict engraftment using both clinical and various predictor genes.

See below for a chart that details the hours worked by staff at the University of Michigan site on this project for FY 18.

Award # W81XWH-16-1-0158

Name	Role	Quarter 1	Quarter 2	Quarter 3	Quarter 4	Totals FY18
Akbar Waljee	Site PI	7.8 hours	7.8 hours	7.8 hours	7.8 hours	31.2 hours
Rachel Lipson	Data Manager	26 hours	26 hours	18 hours	0 hours	70 hours
Tony Van	Data Analyst	0 hours	0 hours	8 hours	26 hours	34 hours
Amanda Ellis	RA	104 hours	104 hours	104 hours	104 hours	416 hours

Sub-Award to UM

Name	Role	Quarter 1	Quarter 2	Quarter 3	Quarter 4	Totals FY18
Akbar Waljee	Site PI	7.8 hours	7.8 hours	7.8 hours	7.8 hours	31.2 hours
Ji Zhu	Co-I	26 hours	26 hours	26 hours	26 hours	104 hours
Gunwong Park	Post Doc (Statistics)	260 hours	0 hours	0 hours	0 hours	260 hours
Xianshi Yu	Post Doc (Statistics)	0 hours	0 hours	0 hours	160 hours	160 hours

Has there been a change in the active other support of the PD/PI(s) or senior/key personnel since the last reporting period?

If there is nothing significant to report during this reporting period, state “Nothing to Report.”

For Hao Zhu, the following grants have become active:

R01 DK111588-01A1 (Zhu)

NIH NIDDK

Title: Enhancing mammalian liver repair and regeneration

The major goals of this proposal are to understand the role of SWI/SNF complex components in liver disease and regeneration.

CPRIT New Investigator Award 9/1/2012 – 8/31/2016 No Effort Required

Cancer Prevention and Research Institute of Texas (Zhu)

The Lin28-LET-7 pathway in liver cancer

\$455,000 The major goals of this project are to determine roles for Lin28 and LET-7 in liver cancer development. AIM 1 of this grant has been completed and published. AIM 2 involves testing LET-7 therapeutic delivery in cancer models, and this is not discussed in the current R01.

For Amit Singal, the following grants have become active:

NIH R01CA12008-01A1 (PI: Singal) 07/01/2017-06/30/2022 3.0 calendar

Harms of Hepatocellular Carcinoma Screening in Patients with Cirrhosis

The goal of this proposal is to quantify HCC screening physical, financial, and psychosocial harms across 3 healthcare settings (academic tertiary care center, safety-net health system, and Veterans Affairs system).

R01-CA222900 (Singal) 01/01/2018-12/31/2022 1.8 calendar

National Institutes of Health

Precision Screening for Hepatocellular Carcinoma

To develop and evaluate a precision medicine strategy for early detection of HCC in patients with cirrhosis tailored to individual patient risk and expected screening test performance

For Amit Singal and Adam Yopp the following grant has become active:

R01-MD12565 (Singal and Yopp) 04/03/2018-11/30/2022 1.8 calendar

National Institutes of Health

Multilevel factors for racial/ethnic and socioeconomic disparities in prognosis of HCC

To characterize the contribution of proximal, intermediate, and distal determinants to disparities to three measure of HCC prognosis in a large, racial/ethnically and socioeconomically diverse cohort of HCC patients

For Daniel Siegwart, the following grants have become active:

I-1855 (Siegwart) 6/1/2017 – 5/31/2020 1.0 calendar

Welch Foundation

“Design and synthesis of activatable pH-responsive water soluble dyes for biomedical imaging” The main objective of this proposal is to develop fluorecene probes capable of detecting cancer metastases.

RSG-17-012-01-CDD 07/1/2017-06/30/21 0.4 calendar

American Cancer Society (ACS)

“A functional polyester library for enhanced and selective miRNA delivery into patient-derived lung cancer cells for advanced cancer therapy”

This grant will identify materials that can preferentially deliver miRNAs to cancer cells, but not to normal cells using normal/tumor matched-pair screening approach.

What other organizations were involved as partners?

Nothing to report

8. SPECIAL REPORTING REQUIREMENTS

COLLABORATIVE AWARDS: N/A

QUAD CHARTS: N/A

9. APPENDICES: N/A
