**Security Class.:** Unclassified

**Supplementary Notes:**
Master of Military Art and Science (MMAS) Thesis prepared at CGSC in partial fulfillment of the Masters Program requirements, U.S. Army Command and General Staff College, Fort Leavenworth, Kansas 66027

**Abstract:** See reverse.
From the American Revolution to the mid-20th century, the regiment, with only a few exceptions, was a primary Army organization. The regiment was also a primary vehicle for the development of American Army histories and traditions. Because of its prominence in history, there are a number of champions for revival of the regiment as an active Army organization.

This study examines the evolution and future of the regiment as an American Army organization. Its purpose is to provide information for a response to the question, "Should the regiment be revived as an active Army organization?" The Army today faces a challenge of providing the best possible organizations with constrained resources. In light of this challenge it is beneficial to consider the historical implications in major reorganization at regiment level.

Regiments are no longer active US Army organizations because reorganizations caused by improving technology and tactics resulted in their elimination from American Army divisions. The inactive regiments are still an influence on Army organization through the Combat Arms Regimental System (CARS). CARS provides many advantages of the regiments without the turbulence of frequent inactivations and reorganizations which led to the regiments retirement. The study concentrates on history in order to explain what the regiment was. Problems experienced by the regiments and organizational changes are highlighted throughout the thesis.

The Army's libraries provided the source material through published histories of the Army, periodicals, reports, and printed records. The study concludes that the regiment should remain in retirement providing its treasures of history through the Combat Arms Regimental System. Because of the great dispersion of modern battlefields, conventional or nuclear, the Army must have tactical organizations that are capable of independent operations that are self-sufficient administratively and logistically. Today's battalions now meet those requirements with more flexibility than was possible with the old regiments.

ABSTRACT

From the American Revolution to the mid-20th century, the regiment, with only a few exceptions, was a primary Army organization. The regiment was also a primary vehicle for the development of American Army histories and traditions. Because of its prominence in history, there are a number of champions for revival of the regiment as an active Army organization.

This study examines the evolution and future of the regiment as an American Army organization. Its purpose is to provide information for a response to the question, "Should the regiment be revived as an active Army organization?" The Army today faces a challenge of providing the best possible organizations with constrained resources. In light of this challenge it is beneficial to consider the historical implications in major reorganization at regiment level.

Regiments are no longer active US Army organizations because reorganizations caused by improving technology and tactics resulted in their elimination from American Army divisions. The inactive regiments are still an influence on Army organization through the Combat Arms Regimental System (CARS). CARS provides
many advantages of the regiments without the turbulence of frequent inactivations and reorganizations which led to the regiment's retirement. The study concentrates on history in order to explain what the regiment was. Problems experienced by the regiments and organizational changes are highlighted throughout the thesis.

The Army's libraries provided the source material through published histories of the Army, periodicals, reports, and printed records. The study concludes that the regiment should remain in retirement providing its treasures of history through the Combat Arms Regimental System. Because of the great dispersion of modern battlefields, conventional or nuclear, the Army must have tactical organizations that are capable of independent operations that are self-sufficient administratively and logistically. Today's battalions now meet those requirements with more flexibility than was possible with the old regiments.
ACKNOWLEDGMENTS

The author of this thesis is indebted to the following individuals for their time, encouragement, and assistance: Mrs. Ardath Mayew of Lexington, Kentucky, my wife and typist. Without Ardath’s help this thesis would not have been possible. Dr. Lynn L. Sims, Professor of History, Faculty, US Army Command & General Staff College, Fort Leavenworth, Kansas, my Research Advisor, and Dr. David C. Skaggs, Jr. of the Faculty, Bowling Green University, Bowling Green, Ohio, who was my Consulting Faculty Member. In addition, I would like to thank LTC Kenneth C. Griffith and Maj. Thomas Ayers, III, both of the Department of Tactics, US Army Command & General Staff College, Fort Leavenworth, Kansas, who were Graduate Research Faculty Members on my thesis committee.

INTRODUCTION

The purpose of this thesis is to examine the evolution and future of the regiment as an organization of the US Army. There is a considerable amount of support for revival of the regiment as an active organization because there is a strong belief that because of the regiments prominence in Army history it carries with it a capability for a higher level of esprit de corps and morale than other Army organizations. The regiments were the custodians of Army history and traditions. Two items which it is believed can be used to develop esprit de corps and concurrently increase unit morale by fostering pride among unit members. This thesis examines the evolution of the regiment from its origins in Europe to its retirement in the American Army so that readers will feel confident that they know what the regiment was, and how it differed from other Army organizations. The size of the regiments or the exact details of its organization are not critical to the conclusions. However, details of organization are frequently reviewed to depict the general direction of changes and the effects of changing technology and tactics. The primary purpose of the thesis is to seek an answer to
the question, "Should the Army revive the regiment as an active organization?" Only through a review of the regiment's history, the comments of its proponents, and pertinent findings of sociologists can the question be answered with any authority.

CHAPTER 1

HISTORICAL DEVELOPMENT OF THE REGIMENT IN EUROPE

The term regiment appears throughout history in almost every army in the world. The regiment is a body of troops, consisting of a variable number of battalions, squadrons, or other units, organized to facilitate administration on a command level below a division and above a battalion. The entire organization of the regiment would be prescribed by a table of organization.

Although there were many times that regiments assumed the roles of tactical units, normally, the regiment was not a tactical organization, nor was it intended to be. The regiment evolved for purposes of administration, discipline, and instruction for a number of subordinate units, and to provide those units with a central supply system and a replacement depot system that would permit subordinate units to maneuver and fight more effectively.

The exact date of the organization of the first regiment is difficult to determine. It could have been as early as 1421, when British historians claim that the Scotsmen-at-arms entered the service of France as
archers or infantry, or as late as 1478, when the German mercenary bands began to appear. For the developers of the regiment we can give credit to the military systems of six different countries, France, Switzerland, Germany, Spain, Sweden, and England.

At the beginning of the 14th century the British raised armies by contract in a modification of traditional patterns of feudal levies. Each knight or noble contracted with the English king to raise a force for foreign operations according to his means. Foreign operations for British noblemen were a means of enrichment. This practice led to a large group of men in England, and Scotland, who not only desired employment on the European continent, but had developed the skills with longbow and pike to be sought after for their abilities. The period in French history from 1380 to 1422 was a chaotic era of economic crisis and civil war. The French noblemen hired many Scotsmen-at-arms and English bowmen.

In the early 15th century the French suffered a slow and systematic conquest by the English and their Burgundian allies despite the charismatic leadership of Joan of Arc. From 1421 to 1429 the French Army was only beginning to use the organized company. The warfare practiced in most of Europe until 1445 was still feudalistic, i.e., a system popularly known in France as
Between 1445 and 1449 from what they had learned from their own experiences and drawing upon the experiences of the rest of Europe, the French formed the western world's first standing army.  

From 1421 to 1444 the Swiss found that the practice of professional warfare could be profitable. Swiss leaders sought contracts to fight for the highest bidder. These Swiss leaders commanded bands known as companies, formed on a commercial basis under colors of both Swiss and Italian units to take profits from plunder or ransom. The companies, ranged in strength from tens to thousands, and manpower came from many countries. The mercenary system developed best in Italy because intense economic rivalry among the wealthy Italian states made it necessary for them to maintain the services of Swiss companies.

By 1478 the German states, inspired by the growth of the Swiss reputation as professional fighters and the growth of Swiss gold reserves from this enterprise, elected to raise a competing mercenary force. Some writers credit these bands of Germans as the tactical ancestors of the modern regiment. German states provided commissions to the Obersts (Colonels) and supported the efforts of the Obersts to recruit, train and employ companies of "Landsknechtes" (Infantry). Each Oberst recruited several thousand men, divided them
into companies, and provided them with their regimental colors (Fahnlein).

The colors were the symbols of their corporate existence, military spirit, and pride in the regiment. When one of the German Free Companies, or Landsknechte, formed, the commander read the terms of service to the men. Following this, each man raised three fingers and swore allegiance in the name of the Trinity. Then the commander formed a ring with his men, after having placed his ensigns inside the ring, delivered their colors and exhorted each man to defend those colors to the death.\textsuperscript{11}

The use of colors was not a new idea. Roman maniples used a handful of straw on the end of a pole as a rallying point in battle. When the Romans reorganized the maniples\textsuperscript{12} into cohorts\textsuperscript{13} a gilded symbol such as a bear, or a dragon replaced the straw. In later years, each cohort replaced its symbol with a square piece of cloth embroidered with its own distinctive unit markings. Each legion during the same time had as its symbol an eagle, which the Romans considered sacred.\textsuperscript{14}

The men of the Landsknechtes learned to master tactics of maneuver and the use of gunpowder rapidly. It was not long before the Landsknechtes developed an admirable reputation and, more importantly, one worthy of emulation. The Landsknechtes actions captured the
imagination of European youths and brought many of
them to the regiments as volunteers.

A peculiarity of mercenary organizations such
as the Landsknechtes was that drillmasters instructed
all the recruits for their operations in home garr-
isons. When the drillmasters tested and declared
their recruits competent for service, they moved into
the tactical ranks. New recruits immediately filled
the vacancies in the training classes of the drill-
masters. This was the beginning of the modern regi-
mental depot system. 

In 1505 King Ferdinand of Spain created twenty
units called "Colunelas" (columns), each consisting of
slightly over one thousand men organized into five com-
panies. By the year 1535 the Spanish combined three
or more colunelas to create a larger organization
called the "Tercio." This new body, with an aggregate
strength of more than three thousand men, developed
many of the traditions found in the modern regiment.

The Maestro de Campo (Colonel) commanded the
Tercio, assisted by a Furriel Mayor (adjutant), a
Serjeanto Mayor (major), and a number of other staff
officers to include a medical staff, thirteen chap-
lains, and a drum and fife band.

During the years 1509 to 1520 the French ad-
miring the concepts of the Tercios, copied the suc-
cessful concepts of the colunelas to include the rank
of the commander. The French also organized permanent regional units, initially called legions. With reorganization, which occurred in France in 1558, the legions became the French Regional Regiments, a title and organization which survived with only minor changes to the end of the eighteenth century.\(^{18}\)

The colonel, now a permanent officer accepted by monarchs and authorized by them to raise men, was the proprietor of his own regiment. Initially, the regiments organized to fight specific campaigns and then disbanded. The dismissal of men who made a living at war produced small bands who turned to extortion and robbery. The problems caused by these outlaw bands made the idea of a standing army increasingly popular and as a result the units were no longer disbanded after every campaign. The regiments maintained their troop strength by the regular input of recruits from the regimental depot system.

In 1611 Gustavus Adolphus became Sweden's king. Although he was an able general in battle, his special talent was the creation of the military organization and his novel ideas on its employment.\(^{19}\)

The Swedish regiment, with an average field strength of eight hundred to one thousand men, used the musket for firepower and as the basis of maneuver. Gustavus organized Swedish regiments with two battalions,\(^{20}\) supported and equipped by the crown.\(^{21}\)
In regiments of cavalry the cavalrymen referred to their battalions as squadrons or cornets. In 1623 Gustavus formed his regiments into "Great Regiments" or "Brigades," each brigade consisted of three regiments. The regiment again was an administrative organization controlling rewards, punishments, administration, supply and services. In the Swedish Army, every regimental commander read the articles of war to his men every month, punishment for breaches of discipline was severe. Swedish regimental commanders stressed continuous training, and Gustavus personally directed reorganization and improvement of equipment for the Swedish Army. The brigade was the tactical unit. The Swedes designed tactics to maximize musket fire, protect the formation from artillery, and allow the pikemen to protect the musketeers as they deployed, fired, and returned to the safety of the brigade formation to reload.

In 1624 Gustavus Adolphus introduced the first regimental artillery piece in history in the Swedish regiments. The Swedish regimental artillery piece had a cast iron barrel which weighed four hundred pounds. Gustavus placed one gun directly into each infantry regiment. The Swedish cannon required a crew of four and could be towed by one horse. This was the first regimental artillery because heretofore armies hired civilian artillerymen for specific engagements.
Gustavus Adolphus' innovations in the field of combined arms matched his improvements in the organizations of each arm of service. Under his leadership musketeers, infantry, cavalry, and artillery became mutually supporting. On November 16, 1632, at the Battle of Lutzen, Gustavus died while rallying his troops, but the Army he left became the model for the rest of Europe.

Since 1569 there had been regiments of native born French professionals. In 1628 under the administration of Cardinal Richelieu, the twelve oldest French regiments received permanent status, never again to disband. They would only reduce their manpower during times of peace. However, the regiments prior to 1639 were still proprietary organizations owned by their colonels; the state provided nothing. There were no uniforms, no discipline, and no way to properly administer or influence the actions of the colonels. Cardinal Richelieu did not like the system of proprietary regiments but he had recognized that the "arrièraban" (feudal peasant levy) was not the answer either. Richelieu's solution, employed in 1639, was to pay the men by state commissioners. This system would prevent the embezzlement of soldier's pay by their officers and would provide a device for the monarchy to maintain its power over a loyal professional army.
In 1684 the French Minister of War, Marquis Francois M. T. Louvois, placed the artillery into separate regiments, finally ridding the military commanders of the civilian gunners who had fought any attempts to alter their artillery tactics. Louvois can also take credit for the formal organization of battalions, subordinate to the regiment, and the placement of the regiment entirely in the role of an administrative unit. The French battalions, the tactical organizations, had seventeen companies of sixty men each. The French regiments, with up to six thousand men, had three battalions in each regiment.26

Until the seventeenth century the English monarchy found its strength in laws and customs. British citizens looked upon military forces as unnecessary on British soil until 1639, when a series of quarrels developed between the Parliament and the king which led to six years of civil war.27 The problems associated with the lack of a standing army and the lack of money provided both sides with a stalemate. Among the commanders of the parliamentary forces was Oliver Cromwell. Cromwell's cavalry regiment provided the decisive advantage28 which led to the defeat of the Royalist forces.

By February, 1645, Parliament established the "New Model" Army with Cromwell in command created around a nucleus of his cavalry. Cromwell organized
the "New Model" with eleven regiments of horse, one regiment of dragoons, twelve regiments of infantry, and an artillery train. Colonels commanded the British regiments. For the first time in British history, Parliament uniformed the entire Army in scarlet tunics with colored facings representative of the regiment's colors. Cromwell formed his army around a nucleus of trained professional soldiers, many of whom were veterans of foreign armies. Cromwell's regiments were both tactical and administrative units, tactical regiments were a result of excluding the battalion from early organization.

In 1647 Oliver Cromwell became Lieutenant General of the Army, and the "New Model" became the standing army of Parliament. It required another year to defeat the Royalists. But with that victory came the declaration that the "new army" was an army of religious conviction dedicated to further the works of the Puritan community.

In 1649 the execution of King Charles I occurred with Cromwell's approval. Cromwell became the uncrowned king and the Army of fifty thousand men became the most formidable force in all of England, Scotland, and Ireland. The Army was the enforcer of Cromwell's policy and many English people considered the Army as a betrayer of the Commonwealth.
period of chaos followed Cromwell's death in 1658, until Charles II ascended to the throne, but Cromwell's reign would never be forgotten and from that day forward an aversion to a standing army would govern the decisions of Parliament.

As the Empire grew, the Army grew. Parliament added regiments quietly and without fanfare because, unpopular though they were, there was a need for more regiments to protect British colonies.

In 1689, during the war with France, the British monarch issued Royal warrants to add thirteen more regiments to the British Army. Growth of the British Army for the war with France brought about many inventions but very few organizational developments.

Until the 19th century Great Britain's Army was not a full time army organization, only the organizations of the separate regiments themselves. In each regiment officers bought their commissions as if the regiment was a commercial company and the commissions were shares. The British named their regiments after the regiment's colonel. The names changed when their commanders changed. During wartime, the British brought their battalions together and organized brigades to provide tactical organizations with a headquarters which a general or an admiral could command.
be of service, they could enter Chelsea Hospital, an old soldier's home established by the king. The soldier paid for everything he needed except for his weapon and ammunition. There were few barracks, so most men lived in public houses. Each regiment purchased uniforms from a fund created from stoppages of pay. Not until 1707 did Parliament take action to standardize or oversee regimental uniform procurement. In all British regiments uniform funds were a source of income for the officers.

For a British Army officer, even in a fortress, a regiment was the center of administration. Each regiment had its agent who kept the books of financial transactions and the agent recorded every penny for each item needed in a regiment. Organizations above the regiments, such as the war office, consisted of only a few clerks to perform periodic checks of the regimental accounts. British historians have characterized the entire system of military finance as a system of fraud. They attributed its longevity to the fact that the state shared in the profit through control of the purchase system and the fact that it reduced the cost of operation of the regiments for the state. The government itself helped to make this reputation by withholding payments to regiments, sometimes for years, only to settle-up by a partial payment of the amount due.
There was no permanent organization of British artillery until the year of 1716; and it was 1727 before the first royal regiment of British artillery formed. Prior to 1716 the Master General of the Ordnance ran an organization separate from the forces. This unit provided the artillery trains, partly crewed by civilians. The first attempts to train qualified artillerymen did not receive serious attention until 1741, when the Royal Military Academy, Woolwich, opened to teach gunnery and engineering. 37

The British regimental system was hardly worthy of emulation by today's standards. However, we must remember three important motives. First, it was basically a good system for its time, with little cost to the state. The British Army was an established institution, forged by frequent wars into an experienced, and well organized military instrument. 38 Second, it was the system that the people of the British colonies knew best. 39 It was a system behind which lay more than a century of military history and tradition. Third, the regimental system was capable of operation for regulars or militia. The system possessed the leading features of organization and tactics of Europe and the experience of the Indian warfare of the colonies tested in both regular and militia organizations.
CHAPTER 2

HISTORICAL DEVELOPMENT OF THE REGIMENT
IN AMERICA TO 1898

In the new world almost every British colony found it essential to create a militia based upon the principle of military obligation. The colonists of the new world experienced quite a different form of threat from the Indians than the people of Europe had ever known. From the first day of the landings of the Virginia Company at Jamestown in 1607, the settlers formed themselves into three groups: one group to construct fortifications, one group as planters and guards, and the third group to explore. By 1623 it became a statutory requirement to bear arms and muster for military duty on call. Militiamen elected their company officers and formed companies numbering from sixty-five to two hundred men.

In 1636 the General Court of Massachusetts Bay organized Massachusetts companies into the colonies first regiments, the North, East and Boston regiments. The colonists attempted to follow the example of the British regimental system for militia organizations. Pennsylvania was an exception to the practice of organizing militia because of the Quaker population's
abhorance to the use of force. This changed in 1747 when, after threats by privateers, Benjamin Franklin organized Pennsylvania non-Quakers into a volunteer organization of some ten thousand men.

Occasional emergencies demanded the use of expeditionary forces and these forces came from volunteer, impress, or draft systems. The recruits obtained their training from the militiamen in the training companies of the regiments. After training and testing their recruits the militiamen shipped the recruits off with the expedition. The militiamen who did the training and recruiting stayed at home to guard the hearth. The effectiveness of these forces, both parent militia regiments and the expeditionary forces, was inferior enough to enforce the claims for the necessity of regular forces to fight the French in 1754.

Major General Edward Braddock became Commander-in-Chief of all military forces on the North American continent on April 14, 1755. Braddock brought with him two regiments of Irish infantry, the 44th and the 42nd of foot, totalling fourteen hundred fifty men. Two more regiments, the 50th and 51st from local recruitment joined Braddock's forces by June, 1755. By fall, 1756, a new oversize regiment formed locally, designated the Royal Americans, or the 60th Regiment.
recruiting for British regiments in the colonies be-
came impossible. The resulting shortage of manpower
forced the British to send additional regiments from
England.

The type of warfare encountered by British
forces was different than that warfare for which they
had been trained. However, the British regular did
well enough to make an unforgettable impression on the
colonists who formed their army of regiments along the
lines of the British regulars.

The colonists had quarreled with Great Britain
for a number of years. The quarrels did not begin to
gain in intensity until after 1773. By the summer of
1774 some military preparations were begun which re-
sulted in the creation of a committee of safety by the
Provincial Congress of Massachusetts Bay on October
26, 1774. On April 19, 1775, the committee of safety
issued a circular letter which called for the enlistment
of an army. On the very next day, April 20, 1775, the
committee authorized a strength of eight thousand men.
They organized their companies on the British pattern
into regiments of ten companies each.

On June 14, 1775, the Second Continental Con-
gress authorized the first muster of troops to assist
forces of militia and minutemen who had assembled at
the call of the Massachusetts Provincial Congress. The
Continental forces, under the command of Major General Artemas Ward, laid siege to Boston held by the British garrison. The troops authorized by the Continental Congress were to be under the command of Colonel George Washington who previously had been the commander of a regiment of Virginia militia. The Continental Congress commissioned Washington as a general and placed him in command of all Continental forces. General Washington moved to Boston on June 23, 1775.

On June 30, 1775, the Continental Congress adopted, after modification, the British Articles of War for governing the initial authorization of troops. The American Army of 1775 had thirty-eight regiments, all slightly different in organization, because the Continental Congress authorized each state to organize its regiments as they saw fit before his appointment. In addition, the British system which the Americans copied organized battalions, brigades, and divisions only in wartime. In peacetime British colonels controlled their organizations with the support of the home counties or districts. The British Army organization remained the same until 1889 when the British adopted a number of reforms to improve their Army and to provide a system to support peacetime rotation of troops to the colonies.
The differences in organization of Continental regiments required General Washington to organize the regiments into brigades of six regiments each. Washington combined two brigades to form a division and the resulting three divisions were approximately equal in size.

By the spring of 1776, in a reorganization of the Continental Army, ten original companies from Pennsylvania, Maryland, and Virginia became the First Continental Regiment. Washington, now a Major General, reasoned that the regiments should be designated not by their respective provincial numbers, but by Continental nomenclature which would also elevate them above the status of a state militia. Washington's reasoning did not survive the actions of Congress when faced with the crisis of impending loss of the Continental Army due to the expirations of enlistments and the resolve of the British in 1776. Congress dropped the Continental numbering system.

In its actions to man the Army on September 16, 1776, Congress used the nomenclature of "battalions" as equivalent to regiments in assigning quotas for manpower directly to the states. Congress designated the number of companies within the regiment as ten, in the British pattern, but used the word battalion as a measurement of that portion of an infantry regiment that was a
tactical fighting force. Congress also charged the states with responsibility to commission the officers of the "battalions" and recruit the enlisted men. A battalion, as an American tactical formation, was a force of about one hundred sixty files of infantrymen. The regiments of the Continental Army were under state control and as a result organized differently in accordance with state directives with any number of men, from three hundred to as high as one thousand. It became easier for Congressmen to refer to the minimum requirements of the battalion sized organization. Congressmen used the term regiment only to discuss the administrative unit.

The key tactical units of the American Army in the Revolutionary War were battalions. Armies to this point, in fact through the Civil War, fought as a tactical whole, maneuvering by battalions. A force would align on the battlefield in a massive formation of subordinate organizations. The force would engage the enemy for the neutralization or destruction of a primary group of forces or an objective. When the force commander wanted to turn, to advance, or to concentrate the power of his force he moved, or adjusted the force by individually maneuvering his battalions.

American Regimental regulations were not standardized until Friedrich Wilhelm von Steuben assumed
the duties of Inspector General in 1778. He organized the regiments into training battalions of two hundred men each and at that point the regiments and battalions ceased to be identical. The battalions became the standard maneuver unit. Steuben's next contribution was to write the first official American military manual in 1779 entitled, Regulations for the Order and Discipline of the Troops of the United States.

The artillery and engineers organized differently from the rest of the forces. They served under immediate Continental inspection not under state supervision as the regiments of infantry and deployed by company or smaller sized unit. In 1776 there were four regiments of artillery authorized with ten or more companies in three of the artillery regiments and eight companies in the other.

Continental regiments received their support entirely from their home states. There were no depot systems for recruits or supplies. Each state government determined the equipment of its regiments, for this reason they varied in strength, equipment and training. Regiments were poorly supplied, ill-equipped, and weak in engineers, cavalry, and artillery.

Washington observed a gradual but determined destruction of his army after the surrender of Cornwallis in October, 1781. The soldiers were going
home and by the signing of the peace treaty, barely seven hundred men remained. For the next three years Congress could not agree on the form of organization or the maximum size of the Army, or if it should be permanent and professional or militia.

On June 2, 1784, Congress instructed Henry Knox, the senior military officer remaining in the American Army, to discharge all but eighty enlisted men and a proportionate number of company grade officers. Congress also ordered the eighty men to guard military stores at West Point and Fort Pitt. With this action Congress ended any possibility for future regiments to draw on the traditions of the Continental regiments since the ties of lineage were completely severed in all cases except one. Today only the Fourth Battalion, 5th Artillery claims a descent directly from a Continental regiment. This unit with its connection to Alexander Hamilton's provincial company of New York artillery, organized in 1776, now ranks as the oldest organization in the Regular Army.

Congress reorganized the Army of seven hundred men on the following day, June 3, 1784. When the reorganization of the Army occurred, the first American regiment consisted of ten companies: eight infantry and two artillery. The mission of the regiment from 1783 to 1790 was to provide troops to man the former British frontier garrisons. The term of service was for one
year.\textsuperscript{20} Congress renewed the state quotas annually and only the aggregate strength of the force changed.

In April, 1790, with the Indian relations deteriorating, Congress authorized an increase to fifty-seven officers and twelve hundred sixteen enlisted men.\textsuperscript{21} This increase encouraged Governor Arthur St. Clair of the Northwest Territory to mount an expedition to punish the Miami Indians for their attacks on settlers. Governor St. Clair's expedition resulted in disaster; the Indians killed half of his forces and scattered the others.

St. Clair's defeat necessitated a reorganization of the Army into the Legion of the United States on March 5, 1792. The Legion of the United States consisted of four sublegions of twelve hundred eighty men each, commanded by brigadier generals. Each sublegion consisted of two battalions of infantry, one battalion of riflemen, one company of dragoons,\textsuperscript{22} and one company of artillerymen. Majors commanded the battalions; the rank of colonel temporarily disappeared. Using Steuben’s book of regulations and constant training, the legion became an effective fighting force and remained as a standing army until May, 1796, when the Army abandoned the legionary designations in favor of conventional regimental designations.\textsuperscript{23} In addition, Congress voted the four
regiments, formerly called sublegions, an increase in strength and authorized six troops of dragoons.\(^{24}\)

On March 16, 1802, the Army experienced another reorganization which reduced fighting forces to two regiments of infantry and one artillery regiment of four battalions.\(^{25}\) Each artillery battalion consisted of five companies.

By April, 1808, Congress, concerned over Indian unrest, authorized an increase in the regular establishment to 774 officers and 9,147 enlisted men. Congress specified that the Army's new organization included seven infantry regiments, one rifle regiment, one light artillery regiment, and one regiment of dragoons.\(^{26}\)

With the opening shots of the War of 1812, less than seven thousand regulars filled the authorized positions. To provide protection for frontier settlers three regiments, the 1st Infantry, 4th Infantry, and 5th Infantry covered the forts from the Great Lakes to the border of Ohio and Indiana. The 2d Infantry was in New Orleans, the 3d Infantry in Georgia and on the Florida frontier, the 6th Infantry covered the southwest, and the 7th Infantry Regiment protected the citizens of Kentucky. The Army used the regiment of dragoons as infantry, and the artillery covered the map from Maine to Georgia. Withdrawal of regular
units from the frontier was an invitation to the Indians to raid frontier settlements and massacre frontiersmen. Even though Congress authorized an additional increase in the active force to twenty-five thousand, less than one-fifth of the strength of the added regiments was immediately recruited. On June 26, 1812, Congress authorized an additional increase which included: twenty-five regiments of infantry, four regiments of artillery, two regiments of dragoons, and one regiment of rifles. By the end of June, Congress reconfigured the infantry and artillery regiments to 10 companies each but not enough men enlisted to fill more than one-third of the positions. The contributions that American Army units made in the land battle came primarily from state militia regiments. The effectiveness of those organizations was such that it can be said that except for the commands of Generals Harrison, Brown, Scott, and Smith, the war ended due to the efforts of the Navy and a negotiated peace.

As for the development of the regiments, in March, 1815, the system underwent another destructive act of legislation which further complicated an already damaged change of lineage. The legislators twisted what few traditions and esprit that the regiments retained into a puzzling maze. The force of
forty-eight infantry regiments declined to a maximum authorized strength of ten thousand reorganized into a force of eight regiments of infantry. Congress also authorized one rifle regiment of ten companies and one regiment of light artillery. To organize this force, Congress formed five or six regiments, which were in each of the eight military districts into one infantry regiment per military district. The newly formed eight regiments received new numbers corresponding to the seniority of the colonel commanding the regiment. These numbers still exist.\textsuperscript{31}

Equipment improvements were slow in getting into the hands of the troops. Although in 1808 Napoleon's horse drawn artillery appeared briefly in the Army, President Madison's Secretary of War decided that the horses used in this unit were a waste of money and sold them. A few units became mounted briefly during the War of 1812, but not until 1838 did light artillery reappear. The reorganization of 1821 provided one "light" company for each of the four artillery regiments but the legislation did not provide the money for the equipment.

The Army published a new set of regulations called \textit{The Military Laws and Rules and Regulations for the Armies of the United States} in 1813. In
general, except for a few minor developments in equipment, administrative and logistical support for the regiments, and with the retention of a nucleus of veterans, the regiments were back where they started before the war.

Military legislation of 1821 directed Secretary of War John C. Calhoun to reduce the Regular Army to 5,586 enlisted men. The same legislation consolidated the 6th Infantry with the Rifle Regiment, eliminated the 8th Infantry and consolidated the Corps of Artillery, the Light Artillery Regiment, and the Ordnance Department into four regiments of artillery.

The General Regulations for the Army; or, Military Institutes, published in 1821, specify the minimum strength of a company as twenty-eight. The practice dictated by the regulation was to designate a recruiting party from the company and transfer everyone else to another company within the regiment. When the company commander and his recruiting party returned with their complement of new recruits, the colonel could, if he desired, transfer the old soldiers back to the company.

The period from 1821 to 1835 was extremely difficult for the Army. The regiments had to continue to perform their tasks and the tasks of men lost because of reductions in authorizations by Congress. The
companies of the regiments were so widely dispersed that concentrations of regimental organizations for defensive operations was impossible. The Indians were quick to recognize the Army’s plight and frequently raided frontier settlements. The dispersion of forces was further aggravated by the shortage of horses, resulting from austerity. Not until March 2, 1833, did the Army receive authority from Congress to revive a regiment of dragoons.

By 1835 the strength of the Army had fallen to slightly more than 4,000 out of an authorized strength of 7,198. That small force nevertheless guarded over 10,000 miles of seacoast and frontier for a population that had grown to over 15,000,000 people. A force of 536 regular soldiers was all that was available for operations against hostile Indians in Florida.

On December 28, 1835, an ambush by Seminole Indians, called "Dade’s Massacre," resulted in the loss of 107 regular officers and men, and the realization by Congress that the small forces of the regiments needed more manpower. By 1837 the Seminole War absorbed nine of the fourteen regular regiments. On May 23, 1836, Congress authorized an additional regiment of dragoons and ten thousand emergency troops
for six or twelve months. However, poor performance of militiamen resulted in further action by Congress in 1838 to strengthen the regular forces.

In 1836 Joel R. Poinsett, President Van Buren's Secretary of War, ordered the purchase and issue of equipment for one light artillery company. The first light artillery company organized in 1838 was "C" Company, 3d Artillery, commanded by Brevet Major Samuel Ringgold. Secretary Poinsett organized a demonstration of Army units and equipment at Trenton, New Jersey, which included invitations to members of the press. Major Ringgold's company put on such a fine show that on July 7, 1838, Congress authorized three more "mounted" light companies, totalling twenty-four guns. Congress also created the 6th Infantry Regiment by adding another regiment of infantry to the Regular Army and authorized one regiment of infantry to be equipped with rifles. The four companies of artillery remained until the Mexican War as the United States Army's only field artillery.

In 1842 Congress again reduced the strength of the Army. However, the numbers of regiments, companies, and commissioned officers remained unchanged even though congressional actions reduced the enlisted strength. Life, for the private soldier returned to the prewar routines of guard duty, ceremonies, and
details from reveille to taps. The call to arms frequently interrupted daily routines at frontier posts as civilization crept westward. The lifestyle of western campaigns, and the battles in the southwest with Seminole and Creek warriors, made the regular regiments units of fighters. 38

The Regular Army received the bulk of the credit for the successful conduct of the Mexican War because the regular regiments fought the initial battles without assistance from the militia. 39 Before the militia could be a help, legislation was necessary to increase the terms of service. When the legislation did provide for more permanence, volunteer regiments provided the largest proportionate service. 40

Congress acted on legislation affecting the size and organization of the Army eight times from 1846 to 1848. By 1848 the legislators learned some lessons about the militia and the Regular Army. The most important lesson were that state militia regiments had decreased in reliability, proficiency, and responsiveness. State militiamen fought the Revolutionary War with a token contribution of volunteers and a regular establishment which represented a fraction of the total force. In the War of 1812, the percentage of state militiamen decreased and volunteer
participation began to increase. By the Mexican War, participation of volunteers was double that of the regular regiments and six times that of the state militia. In addition, the volunteer regiments resembled the regular regiments more than the state militia regiments. Volunteer regiments had ten companies totalling approximately eleven hundred men to a regiment. The state militia regiments had from two hundred men to two thousand since the state could organize their regiments to fit their own needs. As far as the structure of the regiment, it was about the same as it had been in 1812. Only the aggregate personnel strength changed and the states mounted a larger portion of the total force.

Congress designed the reorganization legislation of August 14, 1848, to bring the Army back to peacetime levels. Congress authorized eight regiments of infantry, four regiments of artillery, two regiments of dragoons, and one regiment of rifles. With the exception of an increase of 147 officers, the Army was smaller by 2,222 men than it had been in 1838.

One of the results of having won the Mexican War was the acquisition of 960,000 square miles of new territory. With this new territory, the Army needed regular regiments everywhere. Initially the 1st, 2d, 3d, and 4th Infantry Regiments moved to Pass Christian,
Louisiana. The 5th Infantry Regiment moved to the Indian territories and constructed forts Gibson, Smith, Washita, and Towson. The 6th Infantry, 7th Infantry, 8th Infantry, and the Mounted Rifle Regiments went to Jefferson Barracks, Missouri. The 1st and 2d Artillery went to Governors Island, New York, the 3d and 4th Artillery went to Fort Monroe, Virginia. There were three companies of the 1st Dragoons, seven companies of the 2d Dragoons, and eight companies of artillery stationed on the Rio Grande. 42 The 3d Dragoons returned to the United States and transferred the bulk of their equipment to the 1st Dragoons. All but two of the light mounted batteries of artillery dismounted, and the Army transferred or sold the mounts. The light artillery was not as cost effective as dragoons or infantry on the frontier against the Indians. Therefore, with the exception of only seven batteries, the Army used artillerymen primarily as infantrymen until the Civil War.

Due to the Army's success in Mexico, Congress made little change in its organization, but the legislators closely watched sectional balance and efforts to keep growing unrest away from the Army could have been strong reason. 42 Whatever the true reason, neither the Congress nor the Army attempted
changes to modernize the organizations or equipment. The Army did not revise General Regulations for the Army, 1847, until 1861, and then Northern and Southern forces rewrote their regulations separately. The organization of the Army and the regiments within changed only once before 1861.

On March 3, 1855, Congress increased the number of infantry regiments to ten. In addition, Congress added two regiments of dragoons and two regiments of cavalry. By far the most important change was the provision that the President could, when he desired, increase any of the companies from the old authorization of forty-two to a strength of seventy-four privates. Authorized strength went to a maximum of 18,318. Enlistment periods changed to five years, officers received extra pay of $20.00 per day and enlisted men received double pay for service outside of the United States.

The Secretary of the Army, in his 1858 report, provided the best summary of Army activities for the decade of 1850 to 1860 that is available. It may be safely asserted that no army of the same size ever before performed, in such a length of time, marches and movements of such extent, surmounting in their progress such formidable obstacles. These regiments have accomplished within the year a march, averaging for each the extraordinary distance of twelve hundred and thirty-four miles. These marches, in the main, have been made through the uninhabited solitudes and sterile deserts which stretch away between the settlements of
the Atlantic and Pacific coasts, upon routes which afforded nothing to facilitate the advance, except only the herbage which the beasts of burden might pluck by the wayside. Every item of supply, from a horseshoe nail to the largest piece of ordnance, has been carried from the depots, along the whole line of those tedious marches, to be ready at the exact moment when necessity might call for them. The country traversed could yield nothing. The labor, foresight, method and care requisite to systematize, and the energy, activity, and persistence to carry out such operations by the different departments, deserve the attention of the country and, in my opinion, its commendation too. No disaster has befallen the army throughout its immense ramifications; and the privations, hardships, toils and dangers to which it has been continually subjected, have been borne without a murmur.

The nation entered the Civil War with the same basic system of regimental organizations inherited from the British modified only by the experiences of war with Britain, Mexico, and the Indian nations. How well the Army applied those modifications is questionable. The US Army Regulations governing army organization and tactics were archaic by anyone's standards and yet only twice during the Civil War were major changes made to incorporate changes in the laws passed by the Congress. The southern forces were no better off when it came to regulation, Colonel William Gilham's, Manual for Confederate Volunteers and Militia, was strikingly similar to the federal regulations.
In 1861, before he called for the first levy, President Lincoln consulted the War Department as to the best organization for new regular regiments as well as volunteer regiments. The Secretary of War turned the matter over to Salmon P. Chase, Secretary of Treasury because he was too busy to handle it. Secretary Chase recommended regiments of three battalions, a French system. Two battalions remained in the field and the third operated a regimental depot to recruit and train replacements. Eight hundred men were in each battalion of the new regiments. This was large enough to withstand attack by cavalry and small enough that when organized in eight companies the battalion could be commanded by one man using voice. The French believed that a regiment was an administrative organization, that it could handle more than one battalion, and that the battalions were the best tactical units.

On May 4, 1861, the War Department published General Orders for the volunteers and the regular additions outlining the plans of organization. Congress only authorized the new additions to the Regular Army to organize in the three battalion regimental structure. At this point the Army had three different regimental organizations in the infantry. The volunteer regiments with 866 to 1,046 officers and
men authorized, the 1st through the 10th Infantry with maximum authorized of 878 officers and men, and the 11th through the 19th with 2,020 to 2,452 officers and men authorized. The General Orders also affected cavalry units, the volunteer cavalry regiments consisted of four, five, or six squadrons of two companies each. The regular cavalry regiments consisted of three battalions. Each cavalry battalion consisted of two squadrons and each squadron consisted of two companies. The aggregates for both volunteer cavalry and regular cavalry regiments were about equal to each other. The General Orders which authorized the organizations for the regiments also directed the formation of brigades with once again a difference between regulars and volunteers, two regiments to a regular brigade, four regiments to a volunteer brigade.51

The organization of the Army under the acts of July 29 and August 3, 1861, included nineteen regiments of infantry, six regiments of cavalry, and five regiments of artillery, with a maximum strength of 44,893 officers and enlisted men.52

On August 10, 1861, in General Orders No. 55, the dragoons, the mounted riflemen, and the cavalry consolidated in the same corps. The units became the 1st through 6th Cavalry.53 Strange as it might seem,
the dragoons and riflemen resisted the changes, they claimed that the changes had a demoralizing effect because with the re-naming of the regiments, the traditions and honors attached to the old regiments would be lost. The dragoons and riflemen also disliked the uniform change, the piping on a cavalry uniform was yellow, the dragoons had worn orange piping and the mounted riflemen green piping. Insignia also changed slightly, but as an economy measure the Army authorized the dragoons and riflemen to keep their old uniforms until they wore out.

After the war had begun Congress made few changes in regimental organization despite the fact that the Army recognized the old regimental organization as unsuitable for tactical formations. Improved firearms forced units to disperse and officers frequently lost control. Once deployed, a one battalion regiment was too big for one man and his staff. This was the leading cause of officer casualties because the only way to maintain control was for the officers to place themselves where all their men could see them. Unfortunately, these actions exposed commanders for enemy sharpshooters. After the Civil War, Major General John H. Schofield said, "The cumbersome regimental organization had only worked in the course of the war because the replacement system was faulty."
What General Schofield meant was that because the strength of the regiments fell rapidly, and there were few replacements, they soon reached a size that a colonel and his staff could handle. Companies had the same problem, the practices of organizing an interior structure of platoons, sections, and squads had not occurred in spite of their appearance in manuals as early as 1850.55

Officers described planning at regimental level as crisis management. The regimental staff designed for administrative operations could not effectively manage both the administration and the tactical planning to maintain operations.

The Army provided recruits for regular regiments after 1861 from two principal depots for the general recruiting service. Recruiters sent the recruits for regular infantry regiments to Fort Columbus, New York. They also sent cavalry recruits to Carlisle Barracks, Pennsylvania. Regimental commanders detailed officers from the regiments to recruit personnel in areas designated by the Adjutant General. Recruiting details sent their recruits in parties to the depots where they received some basic training and were given their basic issue of uniforms and equipment. Depot commanders sent the recruits to their assigned regiments from the depots using Army transportation or a
representative from their assigned regiment picked them up from the depots. In addition, the Adjutant General authorized regiments to recruit locally and conduct training in one of the companies.  

Both the North and the South failed to develop a good system to replace men in volunteer units. When a unit's strength diminished to a prescribed level, the shortage of personnel forced commanders to send men back to their home states on recruiting duty or they had the alternative of consolidating with another unit. In many cases army commanders disbanded regiments when reduced by combat losses. Northern governors preferred to raise new regiments because this gave them political patronage through the appointment of officers. The dilatorious effect of this system is obvious since untrained civilians officered the new regiments rather than persons with combat experience.

A review of the General Orders for the Union Army indicates that except for the 5th regiment of artillery, Congress raised no other regular artillery regiments for the Civil War. Eventually two batteries (term battery accepted in 1861) joined each regular artillery regiment providing a total of sixty batteries in the five regiments. Legislation clearly stated that the additional batteries were only
authorized in time of war. However, upon cessation of hostilities these batteries remained until the reorganization of July 28, 1866.

In the first six months of the Civil War, army commanders attached the artillery by batteries to infantry or cavalry regiments or to brigades. Later when large northern armies organized and deployed, commanders recognized the system as inadequate for either administrative or tactical reasons. With the assumption of command of General McClellan, he wrote organizational principles which placed four batteries in each division removing them from the brigade control. At least one of the four batteries was a regular battery; the other three were volunteer. McClellan designated the captain of the senior regular battery of each division as commander of the division artillery.

By May, 1863, divisions relinquished control of the artillery to army corps. This action resulted in the formation of artillery brigades, commanded by captains and considered equal in firepower to divisions. Army corps commanders assigned artillery at a ratio of three pieces per thousand men. The number of batteries in an artillery brigade varied from four to nine. Again each artillery brigade included at least one regular battery. The artillery regimental
headquarters provided administrative and logistical support but was seldom a tactical influence.

In 1863 the Corp d'Afrique appeared, in 1864 the organization became the U. S. Colored Troops, officered and organized under direct authority of the federal government. Initially, Negro regiments began as state units of battalion size, but with the exception of two Massachusetts regiments, all Negro regiments mustered into Federal service. Four Indian regiments joined the Federal organization in much the same manner.

From its reorganization on August 3, 1861, the Regular Army strength was never more than twenty-six thousand until the reorganization of 1865. In fact, because of the preferences of the recruits for the larger bonuses, and the easy-going atmosphere of the volunteer regiments, the newly authorized three battalion regiments of regulars were never able to recruit enough men to fill all of the battalions.

It was the volunteer regiments that provided the majority of the forces for the northern armies in the Civil War. During the course of the war the Northern Army organized approximately 1,700 regiments of infantry, 272 regiments of cavalry, and 78 regiments of artillery. The Confederacy organized approximately 572 regiments of infantry, 150 regiments of cavalry, and 300 batteries of artillery.
In both the North and South, state militia regiments often were regiments in name only. State militia mobilization organizations poorly trained and inadequately equipped their militia regiments. State militiamen still elected their leaders as they did in the Revolutionary War.

The Civil War gave birth to the "Staging" system of supply. The staging system was simply a system of giving the soldier a basic load of rations, which he was not to eat unless supply trains did not issue the daily rations. Every other day the regimental trains delivered rations. The regimental trains picked up their rations and ammunition from temporary magazines which "Supply Columns" serviced by picking up the supplies from the railhead. If the supply lines became too long, they just added in additional supply columns. Each company detailed men to make up the regimental trains led by the quartermaster officer and quartermaster sergeant. 62

The regiments financed their operations through cash purchase vouchers and bills which they presented to the federal government through paymaster or quartermaster channels. State militia organizations and many state volunteer organizations channeled their bills back to their home states and the home states presented the bills to the federal government for payment.
With the end of the fighting Congress turned to the task of reducing the wartime Union Army to a peacetime force. The reorganization of July 28, 1866, was the highest authorization that Congress approved until the war with Spain in 1898. The reorganization of 1866 was the first of seven that took the Regular Army from an authorized strength approximating fifty-five thousand down to twenty-eight thousand by 1889.

By Act of Congress dated July 28, 1866, Congress increased the Army to forty-five infantry regiments, ten cavalry regiments and five regiments of artillery. All forty-five infantry regiments adopted the single battalion organization. A regimental headquarters and one battalion consisting of ten companies composed each regiment. Army leaders having recognized the value of the three battalion organizations requested a return to the three battalion regimental organization; however, Congress denied their requests. Colored Troops composed the 38th through the 41st Infantry and the 9th and 10th Cavalry Regiments. The 42d through the 45th Infantry Regiments constituted the Veteran Reserve Corps. The Army formed new regiments by the expansion of battalions of the old 11th through 19th regiments that Congress had authorized in 1861.

By the end of 1866 the reorganization was practically complete and the Secretary of War distributed
the regiments among the departments. Twelve batteries composed each artillery regiment, ten were heavy batteries, for seacoast fortification organized in two battalions, and two were light batteries or field artillery batteries. The Secretary of War attached the field artillery batteries to the various departments. By 1870 there were still sixty batteries; however, Congress authorized only five of them for organization and equipment as light artillery, the Army armed and used the other fifty-five as infantry.

Changes in the equipment of the Army had been traditionally slow. The large supply of equipment on hand at the end of the Civil War was sufficient to equip the regiments for a number of years further delaying improvements in equipment.

The soldiers who served during the years immediately after the Civil War were mostly veterans. As time passed, only a few of this group remained. An assortment of immigrants filled their places, farm and city boys who had not found a civilian job. Once he had taken the oath, recruiters sent the recruit to a training station for his introduction to the Army. At Columbus barracks, Ohio, drill instructors drilled the infantry recruit. At Jefferson Barracks, Missouri, the cavalry recruit learned how to groom a horse in the regulation manner in addition to drill. Artillery
recruits trained at David's Island, Virginia. After several weeks drill instructors sent these men to their home regiments.

After the Civil War, recruit depots moved quite frequently. On October 4, 1866, Carlisle Barracks, Pennsylvania, became the principal cavalry depot for collecting and training recruits. In 1870 the Army established the cavalry depot at St. Louis Arsenal, Missouri in the middle of what was then horse country. In 1887 Congress appropriated $200,000 for a school to be located at Fort Riley, Kansas, to train the recruits for cavalry and field artillery. Five years went by before the Army opened the school in 1892, but when it opened complete regimental troops of cavalry and complete field artillery batteries trained there with the recruits. Army regulations required recruits sent to Fort Riley to complete their training before joining a regiment.

On March 3, 1869, Congress reduced the total number of infantry regiments to twenty-five and eliminated the four regiments of the Veteran Reserve Corps. Only the 1st through the 10th regiments escaped the immediate effects of this legislation. The Army formed the remaining fifteen regiments by consolidation and redesignation of what had been thirty-five regiments.
The reduction in the size of the Army in 1869 placed the Army in the same situation that it faced in the period of 1821 to 1835. Within the regiments the size of companies fluctuated. In the midst of an economic depression the number of men authorized in an infantry company dropped in 1876 to as low as thirty-seven. The commanders pointed out that when sickness and desertion occurred, the little companies were too small to do their duty in the Indian country where the Army stationed one hundred eighty out of two hundred fifty of the companies.

One month after the massacre of Custer's troops in June, 1876, Congress again reduced the enlisted strength of the Army. Then in August, 1876, Congress authorized the existing cavalry units to be augmented by twenty-five hundred men. The army commanders considered cavalry the best force for use against the Plains Indians. Because of that belief, the June reductions fell almost entirely on the infantry and the artillery to compensate for the cavalry augmentation.

The state militia organizations that had existed since the colonial period had further degenerated. The volunteer organizations which bore the brunt of the fighting in the Civil War were the real militia behind the regular force. A martial enthusiasm of the
period maintained the volunteer organizations. They also attracted men because the regiments were fraternal groups that appealed to the manly virtues of physical fitness, duty, and discipline. The volunteer regiments attracted many because they thought of the regiments like social clubs whose members enjoyed a local prestige. In 1879 the National Guard Association came into being in St. Louis, Missouri. Between 1881 and 1892 every state revised its military code to provide for a National Guard organization. By 1898 the National Guard Regiments were the principal reserve behind the Regular Army.

The Army fought its last Indian battle of any significance at Wounded Knee Creek, South Dakota, in 1890. The abatement of the Indian problem made it possible to abandon some of the smaller posts and concentrate the units under regimental control. The Army stripped two companies from each infantry regiment of all personnel and used the officers and men to fill out the remaining companies. Fifty infantry companies existed in name only, their records, trophies, and guidons preserved by the regiments headquarters.

While activities to consolidate were in progress, members of the administration and of the Army were again arguing that the ten company single battalion regiment was obsolete. The Secretary of War
and Army generals based the principal arguments on the experience of the United States Army in the Civil War and the experience of European nations. In the Civil War the Army learned that with the increased accuracy of firearms, dispersion necessary to reduce casualties prevented one man from controlling ten companies in battle. Wars in Europe had demonstrated that one-third of a regiment now occupied the same front in battle as an entire regiment once had. If everyone accepted this, legislators could not expect a single leader to direct more than four companies in action. The Army, therefore, requested that Congress authorize a three battalion regimental organization to take effect as soon as possible. The Army repeated its request annually without success until during preparations for war with Spain the request received some attention.

On March 8, 1898, in preparation for war, Congress added two regiments of artillery to the Regular Army organization and reorganized the existing artillery regiments. Following the actions to improve the artillery on April 26, 1898, Congress altered the regimental system permanently by legislation. The Army adopted a three battalion organization for infantry, each regiment composed of two battalions of four companies each, and of two skeleton, or unmanned
companies. Upon declaration of war by the Congress, the President had the authority to authorize the organization of a third battalion, to be composed of the two skeleton companies and two additional companies. This same legislation increased the company of infantry to a maximum strength of 250 enlisted men. The legislation also increased field artillery batteries to a maximum of 173 enlisted men.

On April 22, 1898, Congress passed an act declaring the active land forces to consist of the Regular Army and the Volunteer Army of the United States. This action further apportioned the Volunteer forces to the states and directed that their organizations be directed by the Secretary of War during wartime.

The entry of the United States Army into the Spanish American War marked the beginning of the end to the army of regiments. The conflicts in Cuba, Puerto Rico, and Manila had ended quickly. However, many Americans realized that the victories were attributable more to the incompetence of the enemy than to any special qualities displayed by the Army.

The United States had now become a colonial power because of the war with Spain. The study of war grew in importance and Americans turned to a review of what they had to fight with and the organizations of the Army's forces.
CHAPTER 3

SELF-EXAMINATION AND CHANGE, 1898-1962

The Army's renaissance began with the appointment of a post war investigating commission by President McKinley. The commission, headed by Major General Grenville M. Dodge, brought out the serious need for reform in Army administration, operations, and organization. The findings of the Dodge Commission were especially important in light of the entry of the United States into the role of a politically and militarily prominent force upon the world stage.

From the experiences of the Spanish American War, it was apparent that the best organization for an army was that which serves both the tactical and administrative needs. This philosophy, coupled with the growing deadliness of weapons, determined the direction for improved organization. It was also clear that a Regular Army of regiments could not constitute the whole land defense establishment and that stimulation of the militia was therefore necessary.

Many of the generals and regimental commanders in the Spanish American War were veterans of the Civil
War. Some of these officers recognized that problems which had plagued them in the previous wars still existed. In fact, some problems had grown worse because the tradition rich regimental system had defied change. The problems experienced by the lack of an organization of replacement depots had grown. In addition, the lack of a mobilization depot system or any plans for that type of system was a major problem. They were popular subjects of controversy that would last until the Army finally cast the regiments aside. Even though regimental and higher commanders tried many arrangements, there never was a truly efficient regimental depot system for mobilization or for replacements.

In 1899 President McKinley appointed Elihu Root Secretary of War. Beginning in 1899 Root outlined in a series of masterful reports his proposals for fundamental reform of Army institutions and concepts to achieve that "efficiency" of organization and function required of armies in the modern world.

The reports of the Secretary of War from 1899 to 1901 urged establishment of a general staff and an Army War College to study organization, war plans, improvements in warfare, depot system organization for mobilization, and to develop a means to exercise and train the Army in the movements of large bodies of
troops. Root tasked the Army War College students to design exercises to practice maneuver by brigade, division, and corps under conditions anticipated in executing war plans developed by the proposed college. Secretary Root criticized the promotion system of officers based upon seniority and written examinations. The Secretary recommended centralized army promotion boards and a central list rather than the system of promotion within the regiments. He also urged the development of a system that incorporated the officers' efficiency reports.  

Secretary Root based his proposals partly upon recommendations made by his military advisers and partly upon the views expressed by officers who had studied and written about the problem in the post-Civil War years. Root arranged for publication of an unfinished manuscript by Colonel Emory Upton which advocated a strong, expansible Regular Army as the keystone of an effective military establishment. Root's conclusion was that the true object of the Army in peacetime was "to provide for war." Root immediately began to reorganize the American Army into an instrument of national power capable of meeting the requirements of modern warfare. Root believed the Army could attain this objective by integrating the bureaus of the War Department, the scattered elements of the
Regular Army, the militia, and volunteers, and by developing a peacetime organization which focused higher than the traditional regiments.

On February 2, 1901, Congress authorized an increase in the Regular Army. The Regular Army's authorization now included thirty regiments of infantry and fifteen regiments of cavalry. None of the new regiments had any connection with any previous regiment bearing the same number. Congress also authorized a Philippine Scout and a Puerto Rican regiment.

The General Staff published regulations for the Army of the United States in 1901 to include a comprehensive book of instructions which would insure uniformity in both the regular and volunteer regiments. The regulations were careful throughout to emphasize that the battalion was the fighting subdivision while the regiment exercised administrative control over three battalions. The only fault in the transition was that the American battalion was too small to perform its work. A comparison of the new organization with those in Europe illustrated the problems of the small American battalions.

In 1902, because of improvements in conditions in the Philippines, the Army underwent a slight reduction in force. More important was the implementation
of Secretary Root’s long standing plans to close the company sized posts and enlarge the major installations. Root believed that the larger concentrations were more economical and larger concentrations increased the efficiency of the men and the organizations by permitting closer supervision by higher ranking officers. For years Root had attempted to organize brigades and divisions in peacetime and he saw this as an opportunity.

By 1903 the administration had distributed the regiments of the United States Army with one-third of their total force overseas. In addition to the forces committed in the Philippines, the Army located small detachments in Cuba, Puerto Rico, China, Alaska, and Hawaii.

The United States had maintained troops overseas since 1898. Foreign service continued as a permanent part of Army life. Enlisted men recommended by their commanders in the states served two year minimum overseas tours during peacetime if they remained physically qualified. If they wished to extend they could, but, had to submit a written request. Regiments occasionally moved all or a portion of their unit overseas but when that occurred it was a permanent change of station. Peacetime regiments, or battalions did not rotate stations. Depots at Brooklyn, New York and
Fort McDowell, California handled individual replacements.

In 1903 Congress passed an act which had tremendous impact on Army organization. The Dick Act thoroughly revised the obsolete Militia Act of 1792. It separated the militia into two classes—the Organized Militia, to be known as the National Guard, and the Reserve Militia—and provided that, over a five-year period, the guardsmen would pattern their organization and equipment after that of the Regular Army.

Still, the largest permanent peacetime organization in the Regular Army continued to be the regiment. However, the Army published Field Service Regulations outlining plans for organization of divisions in wartime. By 1910 the General Staff completed plans for three permanent infantry divisions. The plans included mixing both Regular Army and National Guard regiments in the infantry divisions.

In 1907 the Artillery Reorganization Act separated the artillery into two arms, field and coast artillery. The act provided a separate regimental organization for the field artillery, leaving the coast artillery as a corps organized in separate companies. Congress increased the strength of both arms—the field artillery from thirty batteries to six regiments of six
batteries each, the coast artillery from 126 to 170 companies. In addition to the changes in organization, legislation equipped the field artillery with rapid-fire guns. Batteries within the regiment had four guns each. With the new organization of six batteries in each field artillery regiment, three were of light (field) artillery proper, two of mountain or pack (mule) artillery and one of horse artillery. With its new organization and new equipment the field artillery adopted new tactics for employment. In 1911 the Army opened a School of Fire for Field Artillery, at Fort Sill, Oklahoma.10

In February, 1903, the infantry organized an experimental machine gun company. This company, although it went through several changes in organization, became the forerunner of the machine gun companies of infantry regiments in World War I. The Army experimentally added a headquarters detachment of seventeen enlisted men and fifteen mounted scouts to each infantry regiment in 1912. With the machine gun platoon, it made up a regimental detachment the parts of which trained intensively in their specialized duties. By 1915 the headquarters detachment had grown into a provisional headquarters company for each regiment of infantry.11 In the same manner, a machine gun platoon added in 1906 became a machine gun company, while a
third new company, a supply unit, began a period of evaluation.

The size of infantry regiments varied, within the limits imposed by law on the President, according to the duty performed. Regiments in the United States in 1912 had sixty-five enlisted men per company, a regimental total of 870 men. While regiments serving in the Philippines had 150 men in each of their companies totalling 1,836 men in their regiments, those regiments assigned to Hawaii and the Canal Zone had strengths that were half that of Philippine regiments. The Puerto Rican Regiment had 165 men in each of its companies but because that regiment had only two battalions, it had a regimental total of 591 men.

By 1910 the Army of regiments had come a long way from that of the pre-Spanish-American War Army. Congressional legislation had roughly quadrupled the size of the regiments and completely re-equipped them. Many of the officers of the regiments had seen combat in Cuba or the Philippines and had received training in Fort Leavenworth's command and staff school. But essentially it was still the "same old Army," small, isolated, inbred and career oriented service. The Administration kept the regiments widely scattered in small posts which local politicians insisted on retaining, long after their military value had passed.
The term of enlistment was only three years but, the regiments operated on a rigid caste system, in which the enlisted men still addressed their officers in the third person.

Cavalry, comprising one-fifth of the total Regular force, served primarily on the Mexican border until 1916. Two cavalry regiments also served in the Philippines and one was in Hawaii. With this dispersion from 1911 to 1916, the Army still conducted various experiments in cavalry reorganization and employment.

In 1911 the cavalry temporarily reorganized the twelve-troop cavalry regiment into one of six troops by consolidation of the troops in the old organization. Cavalry officers believed that this action would result in a more compact unit and bring all men within the sound of the colonel's voice.

Plans for a more effective organization included better location of the cavalry. Upon their return from overseas, the Administration influenced the stationing of cavalry units at posts established during the Indian Wars, located far from centers of population and supply. Most cavalry posts were small, and were in sections of the country where climatic conditions made year round outdoor work impracticable. As late as 1911 forty-nine posts in twenty-four states and territories were still
in use. Thirty-one posts could not accommodate a full regiment, six could accommodate little more than a regiment, and only one was large enough for a brigade. The average number of companies at a post was nine or about six hundred fifty men.

During these years the Army made some changes in the composition of the cavalry regiments. In 1912 the cavalry added a headquarters detachment and a supply detachment to their regiment. By 1915 the machine gun platoon, added in 1906, and the headquarters and supply detachments had become experimental troops, and the next year they became permanent troops. At the same time, the cavalry abandoned the experimental organization of a six-troop regiment.

Thus, the cavalry regiment of 1916 had a headquarters, a headquarters troop, a supply troop, a machine gun troop, and three squadrons. The three squadrons of the cavalry regiment had four troops each. All regiments had the usual complement of officers but the number of enlisted men varied with the mission of the regiment. For example, the authorized enlisted strength of regiments serving within the continental United States was seventy men in a troop, while Congress authorized regiments in the Philippine Islands one hundred five enlisted men in each lettered troop.
The first attempt by the American Army to actually concentrate a force larger than a regiment in peacetime occurred in 1911. The success of the attempt in 1911 is questionable. The concentration did occur, but elements came from across the nation and left many organizations too under manned to perform their missions. In 1913, with another emergency generated by revolution in Mexico, the Army attempted concentration of a division sized force again and was relatively successful. In fact, the troops remained on the Mexican border in the provisional division organization until August, 1915. With stabilization of political conditions in Mexico the Army gradually withdrew the troops from the border.13

On June 3, 1916, in what was actually the culmination of all such legislation since 1899, Congress approved the National Defense Act.14 The National Defense Act of 1916, for the first time in United States history, provided for the establishment of tactical divisions in a peacetime army. The new Act called for seven infantry divisions and two cavalry divisions.15 The Act authorized infantry divisions to have three infantry brigades of three infantry regiments and one artillery brigade of three field artillery regiments. Infantry divisions also received one regiment of cavalry and one regiment of engineers per
division. The legislation also authorized cavalry divisions to have three cavalry brigades of three cavalry regiments, one regiment of field artillery, and one battalion of mounted engineers.

The Act changed brigades and divisions considerably. However, infantry regiments remained about the same within the three battalion structure, cavalry regiments also retained their twelve lettered troops in three squadrons.

The Defense Act officially accepted the provisional companies, that is the headquarters, supply, and machine gun companies that had existed in the cavalry and infantry regiments. This meant that the Army could now recruit and train personnel especially for these units. Previously the regiments filled the three provisional companies by taking personnel from other companies in the regiment. The Defense Act also increased the strength of the field artillery regiments by the addition of a headquarters and supply company to each regiment.16

Congress authorized five years to meet the requirements of the new Defense Act. But, unfortunately, the Army did not organize one of the tactical divisions authorized before the declaration of war in 1917.

Until World War I, Congress retained the direct responsibility for organization. In World War I, Congress delegated the responsibility for organization of
the expeditionary Army to General John J. Pershing. General Pershing assumed the duties as Commander-in-Chief of the American Expeditionary Forces (A.E.F.) on May 26, 1917. He departed for France immediately and began to establish command and staff procedures before the arrival of the first combat units.

Prior to June, 1917, the Army did not have an American Field Army General Staff organized for war. Pershing selected the best features of the British and French systems and with the selection of Major General James G. Harboard as his chief of staff, Pershing organized the American Expeditionary Forces general staff. General Pershing's next task was to devise his combat organizations.

Observation of the warfare in Europe for three years convinced the Americans that the American Army's tables of organization were obsolete. Pershing called the new divisions "square" divisions because they contained two brigades of two regiments each. Because of the requirements of trench warfare, the aggregate personnel strength of regiments went from 2,302 to 3,720 enlisted men. Pershing organized the infantry regiments with three battalions each. Infantry battalions of the regiments had four companies, each company contained two hundred fifty men. Each regiment
also had a headquarters company, supply company, and machine gun company. 19

The organizational changes occurred because of the advances in weapons technology and because of tactical necessity. Depth was necessary in both offensive and defensive formations. In the offense, regiments attacked in waves. Two battalions abreast frequently led an attack followed by a supporting wave of the third battalion. A regiment or brigade constituted a reserve from elements in the first two waves. The reserve followed the attacking waves until needed. The defense required successive positions in depth. For these formations to be adequate, regiments had to be large.

The machine gun was highest on the list of technical developments which changed organization. Finding the best organization to employ the machine gun took the whole war. In May, 1917, the A.E.F. commander authorized one machine gun company per regiment, by July, 1917, this authorization rose to one machine gun company per battalion. Ultimately, the A.E.F. authorized machine gun battalions for each brigade and division. This allowed brigade and division commanders to attach machine gun units as needed. This policy may be seen as the harbinger of a flexible unit combat structure that flowered in the armored combat commands
of World War II and the infantry divisional reorganizations since the Korean War.

Two other weapons that had an effect on unit organization and tactics were the Stokes mortar and the anti-tank cannon. Regimental commanders ultimately placed those weapons in a weapons platoon of the headquarters company of every infantry regiment. 20

Each division also had a field artillery brigade of three regiments and a trench mortar battery. Two of the three field artillery regiments in a division field artillery brigade had two battalions of 3" or 75mm howitzers organized with three firing batteries, a headquarters company, a supply company and veterinary field support. The third field artillery regiment in the field artillery brigade had 6" or 155mm howitzers. This organization had three battalions of two batteries each. The Army called larger caliber battalions motorized. They used an awkward tractor to pull their heavy weapons. 21

Artillery regiments were also part of the corps artillery and the army artillery. The only difference was the larger number of motorized units, and predominance of larger calibers. Each 6" gun brigade had ammunition train sections composed of four truck companies, two truck companies per regiment. The 6" gun brigade also had a heavy ordnance repair shop. But
the basic patterns of organization for all regiments were identical.

The improved artillery, barbed wire, and elaborate field fortifications that existed before the arrival of the Americans hampered the operations of cavalry regiments. As a result only four regiments of cavalry served with the American Expeditionary Forces. The cavalry regiments that did serve overseas were the 2d, 3d, 6th, and 15th. All four regiments served in remount duty. Though the A.E.F. commander authorized additional cavalry regiments for the war, the additional cavalry regiments reorganized as field artillery regiments before they deployed from the United States. The four regiments that did see service in Europe participated in reconnaissance, patrol, and courier duties in addition to the remount service.

Armor was in use by the British and French since its introduction by the British in September, 1916. On December 22, 1917, the Allied Expeditionary Force commander authorized the A.E.F. Tank Corps. By February 18, 1918, the Armor organized a National Army Tank Service in the United States. By the fall of 1918, American tank units using British and French equipment were in combat. American manufacturers were unable to complete any American tanks in time.
for combat use. American organizations were composed of battalions formed in tank corps. American Army commanders did not organize tank regiments during World War I.

The American force gathered for the war reached a peak strength of 3,685,458 men by the end of 1918. These men came from the Regular Army, the National Guard, and the National Army. The identity of the three different groups was completely lost as the Army absorbed men from all three groups in units together. By June of 1918 Congress changed the designation of all land forces to "United States Army."

The Army replacement system intended for World War I was one of unit rotation. The plan was to bring divisions forward intact after their personnel attended training to prepare them for action. The replacement division would relieve the division on line and the combat worn division would move to the rear for rest, recuperation, and replacement of men and equipment. It just would not work. Of forty divisions sent to Europe the first year of American participation, the A.E.F. placed thirty on line. They then broke up ten divisions for replacements to maintain the strength of committed divisions.
Obviously, the replacement actions of the American Expeditionary Forces resulted in the break up and redesignation of many regiments. The Army only organized sixty-five regular infantry regiments during the entire war. However, the Army organized a total of 297 infantry regiments of all types during the war. When replacement of men in units on line became essential, army commanders could afford little or no regard for personnel integrity or regimental continuity.

An excellent example of the problem was the Massachusetts regiments, descendants of the North, East, and Boston regiments referred to in Chapter 2. The old 2d Infantry remained intact under redesignation as the 104th Infantry. The 101st, 102d and 103d, as well as the 101st Engineer Train, 101st Supply Train, Military Police and parts of the 3d, 4th, and 5th Pioneer Infantry absorbed the other Massachusetts regiments.

It is appropriate to mention that the effects of automatic weapons, gas, and improved artillery had further effects on organization. The dispersion necessary for survival resulted in development of the battalions in such a manner as to increase their independence. In addition, military policy discouraged units
from specific geographical localities to prevent disproportionate losses of personnel as the British and certain American regiments experienced during the war. 25

The square division was a ponderous organization suited to the static war for which General Pershing had created it. With the armistice that ended the war came the end of the era of static mass warfare. The proliferation of improved weaponry and mechanization caused strategists and commanders to consider replacements for the square division and its cumbersome subordinate organizations. 26

Sweeping change has to begin at the top. On June 4, 1920, Congress passed a new National Defense Act. The new Act governed the organization and regulation of the Army until 1950. In effect, the Act acknowledged the need for maintenance of the civilian components and made that a task of the Regular Army. The Act ended the policies of an expansible Army that could not successfully mobilize when peacetime authorizations restricted forces to the size of regiments. It also authorized a maximum officer strength more than triple that of the actual pre-war authorization. And, promotion of officers, except for doctors and chaplains, were henceforth made from a centralized list controlled at Army level. 27
During the decade immediately following World War I, the experiences of the war dominated the Army. With the knowledge that memories of the war would fade, the Army organized infantry, tank and artillery boards to guide and plan developments of organizations and their equipment.

The earliest contribution came from the Infantry Board which revised the Tables of Organization and Equipment (TO&Es) of infantry regiments. The revision amounted to a reduction in size which stemmed from the experiences in war which had repeated that the number of rifles in a regiment was impossible to control. The Infantry Board actions eliminated one rifle company from each battalion and reduced the number of platoons in the remaining companies from four to three. A machine gun company replaced the rifle company thereby placing the heavy machine guns under the control of infantry battalion commanders.

In 1922 four regiments replaced the horses and mules of their field and regimental combat trains with the first army trucks. The trend toward motorization continued slowly with regimental headquarters receiving cars by 1936 and by 1939 nearly all regiments could boast of their mechanical mobility.

Even with its lack of mechanical reliability, the tank was a proven combat weapon. The problem was
to properly employ it. The National Defense Act of 1920 abolished the Tank Corps and assigned the tanks to the infantry. By April of 1922 the Army assigned the tank companies to infantry divisions under infantry control. The result of that action was retardation of the development of armor until its release from infantry control in 1939. 31

Seventeen cavalry regiments were still on the roles after the passage of the National Defense Act. Because only a few cavalry regiments saw action in World War I, tradition and a lack of foresight convinced a few diehards that the trenches of World War I were the exception rather than the rule. The Army used a few light mechanized vehicles in the 1920's. However, it was not until the early 1930's that mechanized cavalry regiments appeared mounted in modifications of the infantry's light tanks. The Administration authorized two cavalry divisions but only one was active. The cavalry division had two brigades of two regiments each. During the period of the late 1920's the cavalry arm lost three regiments and ninety-eight troops, some of which had been in continuous existence since the authorization of the 1st Dragoons. By February, 1928, the number of troops in the cavalry regiments declined from six to
four and the cavalry eliminated all separate machine gun squadrons and troops.\textsuperscript{32}

The tradition attached to a number of old cavalry units was nearly lost because of the many organizational changes which threatened multiple inactivations. However, the Army established a policy of retaining surplus units on Army roles in an inactive status permitting the retention of units for future use. This begins the policy of inactive units which became more common place after World War II. With such a policy regimental traditions were not lost and an effective support of esprit de corps would remain for later mobilization.

The total strength of the Army, the number of active cavalry regiments, and the need to maintain fighting strength in troops governed the strength and composition of cavalry units from 1928 to 1939. During that period cavalry regiments had an approximate average of 690 men. There were seventy-eight men in the headquarters troop; twenty-eight men in the band, four rifle troops with 119 men each, and a machine gun troop with 108 men.\textsuperscript{33}

The Army first organized mechanized cavalry regiments on paper in 1932. The first regiment was similar to a horse regiment with an authorized strength of forty-two officers and 610 enlisted men. The
regiment had a covering squadron, a combat car squadron, a machine gun troop and a headquarters troop. Just like the horse regiment, the combat car squadron had four troops.

In early 1933 the cavalry selected Fort Knox, Kentucky, as the site for test and development of mechanized regiments. In the same year, the 1st Cavalry moved to Knox from Texas, and the process of replacing the horses with combat cars began immediately.

Legislation did not restrict reductions to cavalry, the war had indeed grown to a faded memory and throughout the Army austerity was manifest in troop reduction. The Army compensated for the reduction in manpower with the development and exploitation of firepower. Of sixty-five infantry regiments authorized in 1920 the Army inactivated twenty-six by 1922. By 1938 only thirty-eight infantry regiments remained and fourteen of those thirty-eight had only two active battalions each. All but two regiments had headquarters detachments instead of companies. 34

The divisions which the Army planned to use to form the first line of defense existed only on paper by the decade of the 1930’s. The Army General Staff gave mobilization assignments to both active and inactive regiments that, on paper, organized divisions. The situation of paper divisions remained until 1939. 35
Many field artillery regiments had retained the French 75mm howitzers and 155mm howitzers of World War I. What the field artillery regiments did not retain were the organizations of the war. Three battalion artillery regiments were the first to disappear from active service. The light field artillery regiment of 1935 consisted of two battalions of three batteries each, a regimental headquarters battery, a service battery, a band, and a medical detachment. The artillery regiment's commander of 1935 claimed a tactical role which consisted of the responsibility to assign zones, missions, and position areas. However, the official policy credited tactical organization above battalion to division artillery, corps artillery and general headquarters reserve artillery. All batteries of field artillery, until 1941, had six sections, four gun sections, one caisson section and a maintenance section.  

The austerity of the great depression remained until 1935 when a policy of increased government spending resulted in a slight increase in personnel. Because of the increases in personnel and money, on November 5, 1935, the chief of staff approved a letter which began a series of experiments to reorganize Army organizations.
The objects of the experiments were to develop an infantry division that was smaller, faster and with greater firepower than the square organizations. In addition, by 1935, regimental organization was in such confusion that there were five different types in the United States, while no two overseas regiments were alike. The disparity in regiments made planning and resupply difficult. Coupled with the need for reorganization at division and regiment level was a desire to reorganize the battalion to a complete combat unit which would contain all the elements needed to perform offensive and defensive missions. The battalion was no longer to be dependent on the regiment for attachment of additional firepower, except under unusual circumstances.  

Testing began in 1937 with the 2d Infantry Division as test vehicle. By 1939 the Infantry Board developed a full new set of TO&Es from squad to division. The new triangular organization was put into effect on September 15, 1939.

In the maneuvers of 1940 five divisions field tested the triangular organizations. The results were so satisfactory that the Army triangularized nine divisions before the year was out.

The triangular division was almost one-half the size of the square division. The offensive striking
force of the new division was its three infantry regiments, three 105mm howitzer battalions, and one 155mm howitzer battalion. In support of these units were an engineer, medical, and quartermaster battalion, a reconnaissance troop, a signal company and a military police company.

The triangular organization eliminated the brigades, this placed the infantry regiment in the role of a tactical and administrative unit. Infantry regiments of 1940 had two or three battalions, a cannon company, an anti-tank company and a headquarters and service company. Regiments subdivided the regimental headquarters company into two main parts. The company had a communication platoon and an intelligence and reconnaissance platoon. These platoons provided the augmentation necessary to perform the new tactical role.

The Army completely and permanently eliminated the field artillery regimental headquarters with the reorganization to triangular divisions. The artillery redesignated the field artillery battalions in such a manner that only the lowest numbered battalion retained the original regimental designation. The reorganization substantially increased the support assets of the field artillery battalions to allow them to function independently. This change was taken completely in stride.
facilitated by the fact that artillery regiments had seldom deployed intact. Field artillerymen considered the reorganization as improvement in field artillery since battalions were now more independent and it was much easier to mass their fires. The traditional regiment had been an obstacle to the massing of its battalion's fire with that of other battalions.41

National Guard units did not reorganize until after their entry on federal service after December, 1941.42 However, the triangular structure was basically the organization that all divisions used in World War II.

The reorganization of existing units was nearing completion in March, 1942, when the first change occurred. The new armor division organization eliminated the brigades. The combat of World War II was highly mobile requiring flexible combined arm commands tailored to achieve specific objectives. The Armor Board added two combat command headquarters, that became popularly known as combat commands "A" and "B" to each armor division. These new organizations provided flexibility demanded by armor missions because the division commander could compose any combination of divisional units for as long as he saw fit.43

The infantry divisions actually applied the same corrections except they did not create new
organizations. In the infantry divisions the regimental combat teams (RCTs) became the infantry equivalent of the combat command. An RCT was a grouping of combat units around an infantry regiment in order to accomplish a specific mission. A typical RCT contained a regiment of infantry, a battalion of artillery, a company of combat engineers, a company of tanks, a medical collecting company and a signal detachment. Because of their flexibility the combat teams were valuable organizations.

In 1943 the armor divisions reorganized again. The combat commands eliminated armor regiments completely and armor divisions added a third combat command, the reserve command. Developers of the armor division primarily designed the reserve command to provide a headquarters for reserve elements and to provide control on the march rather than in combat.44 It is important to note that to facilitate the use of combat commands and RCTs the battalions also required internal organizational change. Regiments had to this point provided administrative support for all regimental organizations freeing their battalions of those burdens. By December of 1943 battalions had headquarters companies in place of headquarters detachments and were administratively self-sufficient.45
During 1943 regimental organizations disappeared from the organization of service troops. Army commanders reorganized their truck regiments into self-sufficient separate battalions. Medical regiments, formerly organic to armies, were also broken up into collecting, clearing, and depot companies and attached to subordinate elements where needed. From that point on the basic unit of organization for supply and services became the company. For command and control of several companies division commanders created battalion headquarters and headquarters detachments for divisional units. For several battalions, as found among non-divisional organizations, army commanders created group headquarters. The only noteworthy exceptions were chemical, military police and signal battalions which remained under the control of their parent regiments.

For World War II, the Army organized 317 regiments of various kinds of infantry. There were types of infantry that had never appeared among Army organizations before the war. There were three mountain infantry regiments, twelve glider infantry regiments, and sixteen parachute infantry regiments.

The designation of regiments followed the traditional pattern throughout the war. The Army reserved
numbers above five hundred for parachute infantry regiments. Glider regiments came from any of the numbers below five hundred, a result of an effort to perpetuate earlier regimental histories. The three most unusual regiments, occasionally called hybrids, were the 473rd, 474th, and 475th Infantry Regiments. The Army organized the 473rd Infantry from a consolidation of the veterans of four anti-aircraft battalions. The 474th Infantry contained men from the 1st Special Service Force, the 1st, 3d, and 4th Ranger battalions, and Norwegian-Americans from the 99th Infantry Battalion (separate). The 475th Infantry Regiment formed from the veterans of the 5307th Composite Unit (Provisional), more commonly called "Merrill's Marauders." 48

The Army broke up or eliminated all but six regiments of armor and organized separate battalions from them. Cavalry mechanized completely. Some efforts to retain the horses appeared in the form of horse-mechanized regiments. In those regiments cavalrymen used large vans to transport horses at the pace of mechanized elements. The National Guard regiments provided seven horse-mechanized regiments.

With the activation of the 9th and 10th armored divisions in 1942 the Army redesignated the 2d, 3d, 11th, and 14th cavalry as armored regiments. Shortly
thereafter, the general staff revised the directives to inactivate the cavalry regiments and reactivate them as armored regiments. In 1943 the Army reactivated the cavalry regiments. On April 4, 1946, the Army abolished horse cavalry in the United States Army. In 1951 the Army consolidated the descendants of the four cavalry and the four armored regiments and reorganized them to form four armored cavalry regiments active today.

On June 1, 1945, the Infantry Board published new TO&Es for infantry organizations. The infantry regiment had grown from 3,256 to 3,697 men. Most of the increase occurred in the increase in rifle company strength from 193 to 242 men. The Board also added new weapons when they placed rocket launchers and recoilless rifles in weapons platoons. But, in the 1945 regiments the new TO&Es eliminated the cannon companies. The cannon companies born at the end of World War I ultimately became mounted 90 mm guns, to effect a tank, and as a result were a duplication of armor attachments. The organization of June, 1945, was the last modification of the war. 49

On June 17, 1945, the Army established the general boards to prepare a factual analysis of the
strategy, tactics, and administration employed by the United States forces in the European theater. The general boards recommended additional changes for infantry regiments. The board members felt that the regiment's headquarters was still too weak for a tactical role. They recommended additional communicators, military police, elimination of the anti-tank company, more personnel in service companies and most important assignment of the regiments S-4 to a battalion and that each battalion have its own S-4, supply, and service capability. The board also criticized the reinforcement battalions. Army T&Es authorized reinforcement battalions or replacement cadres assigned to regiments with the intention that they would train and indoctrinate replacements for the regiments and that divisions or regiments would rotate to rear areas for recuperation and replacement. This never occurred and the reinforcement system did not operate to allow time to build up esprit or to contribute to close personal teamwork considered necessary for success in combat. The board members recommended that replacement battalions be organic to divisions. Two wars had proven the futility of attempting to operate regimental replacement battalions.

With the end of World War II came the unfortunate experience of demobilization by the PC system.
The system pleased the public but, its effects on unit integrity, efficiency, and combat capability were catastrophic. The Army completed the process of demobilization in June, 1947.

From the recommendations of the General Boards all the branches changed TOEs in April and October of 1948, and again in April and June, 1949. Armor organizations had already eliminated regiments so they were the least effected. The Armor Board designed armor changes primarily to strengthen battalions. Infantry divisions incorporated many of the recommendations of the general boards. Artillery organizations added thirteen officers, five warrant officers, and over one hundred fifty enlisted men to each battalion. The primary changes in artillery organization were an increase to six section batteries and an increase in battalion staff and service capabilities to heighten administrative self-sufficiency.

The infantry regiments of 1950 grew from 3,697 men to 3,774. Infantry regiments consisted of a headquarters and headquarters company, three battalions (each had their own headquarters companies and heavy weapons companies), a 4.2 inch mortar company (with twelve mortars), a heavy tank company (replaced the old anti-tank company), a medical company, and a service company.
In the Army Organization Act of 1950, Congress designated "Armor" as the branch of armor and cavalry. With the activation in 1950 of the 11th Armored Cavalry Regiment the total number of active regiments of this type was five. The five armored cavalry regiments were the 2d, 3d, 6th, 11th, and 14th; none of them served in the Far East during the Korean War. 56

The infantry regiments of the mid-1950's total forty-six regiments and thirteen separate battalions. Of forty-six infantry regiments, the Army organized eleven as separate organizations. In addition, National Guard regiments brought twelve infantry regiments into the active Army for the Korean War. 57

The Army eliminated the Negro units which had become a part of the Army during the Civil War in the mid-1950's. As of June 30, 1954, no separate Negro units existed on the rolls of army organizations. 58

By 1956 only fifty-four infantry regiments and four armored cavalry regiments remained on active duty. The period following the Korean War to 1956 had been a particularly difficult time as the administration in a re-evaluation of national policy began the era of "massive retaliation."

On February 1, 1955, Headquarters Continental Army Command (CONARC) began studies of a new concept
tailored to the national policies of massive retaliation. The Army Chief of Staff approved the concepts initially titled "Pentana Army" in June, 1956. The two most prominent characteristics of the Pentomic concept are found in its approved name—pentagonal structure and atomic capability. An organization based on five subordinate units replaced the three unit organization of the triangular system. Tactical nuclear weapons became the key weapons system in this new pentomic organization.59

By 1958 all army divisions had reorganized. Gone was any semblance of the three regiment structure and regimental commands. Instead there were five battle groups of a size between battalion and regiment. The requirement for wide dispersion on nuclear battlefields to deny the enemy nuclear targets was a key consideration in adopting an organization with five small combat units, while developments in the field of communications made a broader span of control possible. The Pentomic reorganization eliminated the regimental service companies and medical detachments along with the regimental headquarters. The concept transferred their functions to headquarters and headquarters companies (troops) of the battalions (squadrons).60

The Pentomic organization was a divisional reorganization and as such is not within the scope of
this paper, but like the square and triangular organizations of the past, its effects induced major changes in all units. The single most important change was the permanent elimination of the regiment from the infantry structure. Only armored cavalry regiments would return to that structure in the reorganization of 1963.

The armored divisions combat command organization was easily adaptable to the nuclear battlefield. Because of that, the Reorganization Objective Current Armor Division (ROCAD) and subsequent reorganizations for armor represented little more than the gain of an atomic capability. 61

The Army's commanders and General Staff viewed the Pentomic reorganization as a beginning rather than the end of the Army's adaption to the nuclear environment. Because the potential for limited non-nuclear war was growing, Pentomic organizations were no more than interim measures. By May, 1964, all divisions reorganized again under a newer concept called Reorganization Objective Army Division (ROAD). 62

ROAD, like Pentomic, was primarily a division reorganization. The important point is that under ROAD only the armored cavalry regiments returned to the regimental structure. It is important to note
that the armored cavalry regiment of 1963 was in reality a completely new organization. The total size remained about the same but the addition of aviation and its effects on tactics made it a modern regimental combined arms combat team.

Pentomic reorganization brought with it the most drastic reorganization of Army units since triangularization, or for that matter since the abandonment of Anthony Wayne's Legion in 1796. The Pentomic concept eliminated both regiments and battalions in the infantry arm. Pentomic reorganization raised the question of how to designate the new units. The Army staff solved the problems with the adoption of the Combat Arms Regimental System (CARS). CARS was a plan developed by the Army staff on the model of the British regimental system.63

The Secretary of the Army approved the CARS system on January 24, 1957. The concept is based on the fact that efficiency and morale of fighting men are greatly heightened by pride in their unit. Unit pride often springs from past achievements, traditions, battle records, and battle honors. Since the most significant combat unit in the American Army has been the regiment, the CARS system uses the regiment as its base. In addition, because it is not used as a
tactical organization, it is no longer subject to periodic reorganization. One of the problems incurred in the system was that in truth there are not many historically significant regiments. Under the CARS system, regimental honors and traditions are shared. With CARS, the regiment is not a tactical unit, but a family of units. Each member unit traces its lineage to an element of an historically significant regiment.

Under CARS units may claim two kinds of honors, earned and shared. All the elements of a parent regiment may share the campaign credits and honors of the parent regiment. Units under a parent regiment may also claim their own contributions to the regiment's honors by display of special devices on the streamers of their colors.

With the Army's reorganization under the ROAD concept the designations of battalions became standardized. The official designation for all battalions consisted of the battalion number and the parent regiment. Descriptive terms such as airborne, mechanized, or separate, are placed in parentheses after the numerical designation.

The CARS system maintains regiments on permanent active roles with only the headquarters of the
regiments inactive. At the present time there are sixty-one CARS infantry regiments, fifty-eight field artillery, twenty-two air defense artillery, twenty-nine armor/cavalry and one special forces regiment.\textsuperscript{67}

Under the original plans for CARS, the Army would adopt the system in five phases. The first three were designations in order of the Active Army, the Army Reserve, and the Army National Guard. The fourth phase involved planning for mobilization of additional elements. The fifth phase was to provide a home for the regimental headquarters, a home for all members of the regiment. The original plan envisioned the Army assigning the regimental headquarters to a permanent location where the regiment could display and maintain regimental records, colors, and trophies. The Army Chief of Staff rejected a proposal to implement this last phase in 1960 because of a lack of funds.\textsuperscript{68} To this date the Army has implemented neither of the last two phases. However, without exception, the CARS system has accomplished the first three phases thereby demonstrating its flexibility. Most important, the CARS system has perpetuated the honors and the histories of the regiments.
CHAPTER 4

REGIMENTAL REVIVALISTS AND THE SOCIOLOGISTS

A review of the general history of the regiment was essential to describe the organization, and to relate the facts behind previous periods of reorganization. The regiments have, in fact, withstood numerous reorganizations and quite possibly had another internal reorganization occurred before the acceptance of pentomic organizations, regiments may have survived both Pentomic and ROAD.

The suggestion that the regimental system could have survived is based upon acceptance of the thesis of Colonel Carleton E. Fisher. In December, 1955, with the Army on the threshold of a radical series of reorganizations, Colonel Fisher suggested that the advantages of the regiment need not be lost in creating atomic age infantry units. His theory was that if the Army called the brigades or combat commands regiments and reorganized them to perform as the brigades and combat commands perform, the organization would be just as effective.

Colonel Fisher made a few critical assumptions which changed the nature of the regiment of the early
1950's. First, he recognized the validity of field tests and combat experience and agreed that a regiment should be a headquarters and any number of battalions. Combat experience and field tests had shown that the old regimental system of logistical, administrative, and combat support from regimental companies was inflexible. Because of temporary assignments with wide dispersion caused by the RCTs and combat commands, there was insufficient support assets to meet requirements. Colonel Fisher also agreed that it was necessary to concentrate a portion of the service support in the division support command and to eliminate regimental tank companies in favor of separate tank battalions. In simple terms, Colonel Fisher suggested that the brigade as we know it today, as solely a tactical command, could be called a regiment. The only difference would be the controversy of whether the battalions should be organic to the regiment, or separate organizations attached as needed.

Colonel Fisher used a brief review of regimental history as evidence that the only barriers to his suggestion were a psychological disadvantage and the rigidity of tradition. The psychological disadvantage in 1955, according to Colonel Fisher, was that the retention of the name regiment would in effect
mean the argument for retention of the rigid system. It might also encourage periodic outcries for a return to regimental control of administrative and logistical support companies. In other words, if we retain the regiment there would be nothing psychologically new about the organization. The rigidity of regimental tradition was probably the major reason for departure to a new organization. To retain the regiment many leaders felt that the main question was whether or not the battalions were organic to the regiment. If the battalions were to remain organic to a regiment many thought that flexibility would be lost.

When the transition to Pentomic organization occurred in 1956, there were a number of writers who began to argue with Colonel Fisher's thesis by offering a new series of suggestions. Most popular was that the British regimental system might be the answer to the problem of developing flexibility of organization without losing unit continuity and the traditions associated with the regiments.

Actually the suggestion to adopt a portion of the British regimental system preceded the Pentomic organization by more than a year. Lieutenant Colonel Spencer P. Edwards, Jr. described a number of suggestions in an article which appeared in May, 1955.
Colonel Edwards reminded his readers that the regiment should not be a tactical unit. He did say that it should be a repository of tradition and a headquarters for an indefinite number of battalions. Battalions that are members of a regiment should be administratively, logistically, and combat support self-sufficient to permit their deployment to any division.

Almost all the writers of the period within a year of the Pentomic reorganization had similar suggestions to adopt the British system. There were a few who suggested the retention of the pre-Pentomic regiment. Among them was General (then Colonel) Bruce Palmer, Jr.

In May, 1955, General Palmer recommended a streamlined infantry regiment without alteration of the basic structure. One problem with General Palmer's suggestion was that he relied heavily on deployment of Regimental Combat Teams (RCTs). From his vantage point in 1955, the RCT, rather than the division was the best basic unit of combined arms. General Palmer's ideas also included making the infantry battalion logistically self-sufficient. His ideas were primarily influenced by European experience where the RCTs received their battle test. They had proven themselves in warfare where position defense was impractical because of wide
Another problem with General Palmer's suggestion was that adoption of RCTs would not solve all the problems of reorganization in the mid-1950's. Reorganization had to include a standard combat command system. One of the goals of both Pentomic and ROAD reorganization was to design a standard division organization. The RCT did not appeal to armor enthusiasts nor to mechanized or armored infantry proponents.

During the test and evaluation period a few articles appeared that questioned the existence of esprit de corps in the regiments of the 1950's. Major General H. W. Blakeley condemned rotation and the Army's replacement system for making some of the Army's regiments merely numbers on a roster.

General Blakeley recommended changes in both the replacement system and the adoption of portions of the British regimental system. Many different replacement systems received testing and evaluation between 1950 and 1960. The Army experimented with gyroscope or unit rotation, with and without dependents. The Army also tried variations of individual rotation plans. In most cases the individual plans worked best in conjunction with a division or higher replacement unit. Many individuals did not care for permanent assignment to a regiment especially those
who felt they could be promoted faster if they could be moved to higher rank positions regardless of the organization. Since corps and division headquarters were now permanent peacetime organizations, it was easier to compete for positions of higher rank or responsibility, which were common in higher headquarters, with individual rotation plans. As a result the Army drifted into an individual system to facilitate possibilities for promotions. Gyroscope rotation was also a failure in practice since equipment and facilities could not rotate with the personnel. Mismatched assignments and turbulence from frequent movement caused widespread dissatisfaction.

Because so many writers advocated the British system, it would be advantageous to review that system. The British regimental system is basically the same as described in Chapter 1 except for one major change which occurred in the nineteenth century under the command of Lord Viscount Cardwell. Cardwell designed a system to facilitate the simple objective of supporting peacetime troop rotation between the home islands and the colonies. At the time the British Army adopted Cardwell's plan, it met with vigorous opposition. However, in less than ninety years the system has grown so strong that the whole British nation would unite instantly for its defense.
Cardwell's plan was only a modification of a system with origins reaching back over the ages to the days of medieval knight service and feudal levy. Before the 16th century all land tenure in Britain depended on the tenant's liability for military service. When called by the king to take up arms the local landowner reported for duty with a band of tenant-followers from his lands. The band of men, all sharing similar predilections and prejudices, knew each other and firmly believed that together they formed the best combat team in the king's army.

With the birth of the British standing army in the 17th century, the method of recruiting that had been so successful in the past remained. The king bestowed a Royal Warrant to form a new regiment upon an individual of local prestige and position. The holder of the Royal Warrant, the colonel, went to his own territorial region to fill his regiment's ranks. Even though the officers purchased their commissions from the colonel, the officers were friends, or the sons of friends, who had reputations within the region recruited.

Initially British regiments adopted their colonel's name. In 1757 British regiments received numbers and adopted the name of their home county, where the regiment remained during peacetime. The fact that the
regiments or their battalions often received transfers from one brigade to another in no way affected their individual esprit de corps. Their fealty even today is primarily to their own regimental traditions enforced by the support of the local civilian population.

With Cardwell's modification all infantry regiments had two battalion groups. At least one battalion of selected regiments served in the colonies. Each regiment consists of at least one Regular Army battalion and one or more Territorial Army (National Guard) battalion.

Cavalry regiments, except for the Household Cavalry, were all members of "cavalry of the line," all soldiers enlisted for cavalry joined the cavalry of the line and not a specific regiment. In the first year of the Second World War the British Army merged the cavalry of the line, with the Royal Tank Corps, and formed the Royal Armoured Corps.

Today the Royal Armoured Corps is comprised of regiments that use traditional names. The officers and men of the Armoured Corps receive assignments to home regiments on a more or less permanent basis. Initial armor training is centralized and assignments across regimental lines are common.
Within the British infantry, regiments are now grouped in divisions, such as the Scottish Division, the King's Division, or the Queen's Division. Soldiers enlisted into the divisions receive training and serve with whatever regiment requires them. Every effort is still made to allow officers and enlisted men to stay as long as they desire with their parent regiment.

With the outbreak of war, the Army would expand by mobilizing the Territorial Army and then recruiting a number of new wartime battalions. Battalions serving outside the home territory or in combat with a wartime brigade do not necessarily have to rotate intact. Recruits train in the Depot and Headquarters which for the infantry is permanently located in the home county. When a requirement for replacements occurs, they are sent from the depot or from another battalion of the same regiment.

In the British system the regimental headquarters, commanded by a lieutenant colonel, permanently remains in its home county. The headquarters is responsible for such things as recruiting, induction and demobilization, individual and regimental records, veterans welfare, and regimental customs and procedures. The senior retired officer of the regiment is given the honorary title and position of Colonel of the Regiment, with responsibilities...
of watching over the interests of the regiment. The Colonel of the Regiment selects candidates for commissions, represents his regiment on official and non-official occasions, and prescribes policies on domestic matters.

This system obviously has advantages in that it promises unit integrity, cohesiveness, and a system to maintain history, tradition and esprit de corps. Nonetheless, this system has disadvantages. First, the system would represent a radical change in American Army administration practices. Men cannot be classified simply according to branch of service, grade and specialty. Every assignment and record would have to include the regiment so that troop assignments could be made within regimental units. In the American Army, combat troop duty represents about one-half the possible assignments so another system would be necessary to administer assignments outside those positions. This is not as great a problem in the British Army as it would be in the American Army because of the difference in relative size of the countries.

Britain's total population in 1974 was approximately 56,250,000. Britain's total armed forces were 361,500 (including 9,300 enlisted outside Britain). Of the total British armed force, only 177,000 men serve in approximately 69 regiments and 55 separate
battalions of all types. In the same year, the American Armed Forces numbered 2,252,000 out of a total population of 210,900,000. Of the total American Armed Forces the Army had 801,501 personnel (including 16,000 women). Overseas, the Army deployed more than 300,000 men and women in 1974.

The second greatest disadvantage to American adoption of the system is the increase in the risk of one area suffering heavy losses in wartime. This disadvantage is not denied by the British, they have taken the position that it is a risk of war and must be accepted and that the risk can be minimized by keeping the units small. According to Major Julian Paget, "It is no more of danger nowadays than the possibility of whole cities being wiped out by an atomic attack." However well the British can accept this disadvantage is one thing, we do know the Americans cannot because of American reaction to losses of large numbers from one family and one community which occurred during both world wars. The American Armed Forces have for the past thirty years enforced policies which discouraged units from recruiting solely from specific geographic localities and prohibited multiple members of a family from being assigned to one command unless it is at their request and then the right of sole-survivorship must first be waived.
The third disadvantage lies with the character of the American people who are unlike the British who spend their entire lives close to the same spot where they were born. Americans are prone to move frequently and far away from home. Like the frontiersman of America's early history, modern Americans are far more apt to move if only because they can experience a change even if opportunity is not promised. In short, to live out an army career in the same unit for twenty to thirty years violates the wanderlust of the American psyche.

A fourth disadvantage of the British regimental system is that it has prevented the trial of new ideas. The British have not fully examined centralized selection of men, use of training centers, and the matching of men to jobs based upon intelligence, skills, and aptitudes.

There are many other disadvantages, in fact, the best document including discussions of the major disadvantages is Infantry Bulletin No. 38, published by the British Directorate of Infantry in 1946. It is interesting to note that in reorganization of the British infantry, the British system relied on the decisions regarding the "teeth to tail ratio" for the survival of their system. We find the American
Army in the same position today, greatly concerned with the ratio of combat to support elements.

The majority of American advocates who wished to see the regiment retained also wanted to see the adoption of portions of the British system. Such men as Major General Hamilton H. Howze, Brigadier General Edwin K. Randle, Colonel Elmer Schmierer, Colonel Lyman H. Ripley, Colonel Patrick D. Mulcahy, Lieutenant Colonel Samuel H. Hays, Major F. W. Wunderlich, Major James W. Kerr, Captain Thomas G. McCuniff and Captain Harold J. Meyer all wrote articles for professional periodicals advocating adoption of the British regimental system.

A direct result of the arguments by proponents for the British system was CARS, the Combat Arms Regimental System. Secretary of the Army Wilbur Bruckner approved CARS on January 24, 1957, after it had received more than two years of study.

CARS has admirably proven itself as an effective solution to the Army’s problem of maintaining historical continuity among combat units. The American Army borrowed the plan directly from the British system, however, the American Army planned also to incorporate the concept of the parent regiment as the head of a family of battalions. In addition, the Army
General Staff planned to permanently assign the regimental headquarters to CONUS locations where they would provide facilities to maintain regimental histories, records, perform recruiting, and operate regimental training units. The General Staff planned to assign the responsibility for supervising the activities of the Regular Army regimental headquarters to the Continental Army Command. While the National Guard Bureau would monitor the National Guard regiments.

The regimental headquarters have not received support for a number of reasons. In short, it is an expensive proposition. Because the Army separately designated the Regular Army, the Reserve, and the National Guard units, the concept of a "home regiment" seems unworkable. In the British system all the battalions, Regular, Territorial, and Conscript Army are organic to the home regiment. The CARS proposal in effect created two separate groups of regiments. In a review of American history, we can find evidence that some regiments never had a home. Because they never had homes it would be necessary to select homes for them, another aspect judged neither feasible nor desirable. 12

Early studies recommended that regimental headquarters be established outside the tactical
structure of the Army. The headquarters of all regiments could be assigned to their respective branch and schools centers. The Department of the Army staff concurred in the findings of the study but the Chief of Staff could not implement the plan because school commandants were reluctant to support the activities proposed for the regimental headquarters. In October, 1971, the Chief of Staff directed a re-examination of the feasibility of implementing the assignment of parent regimental headquarters to permanent locations, but the study reaffirmed the weaknesses of the "home regiment" concept, and deferred final judgement until more favorable conditions appear.

The most current suggestions to re-evaluate the regimental system came from Colonel William L. Hauser who studied the contemporary Army and published his findings in a book entitled, America's Army in Crisis. In addition, Captain Richard H. Sinnreich and Colonel George K. Osborn, both faculty members at the United States Military Academy have devised a plan involving the revival of regiments.

Colonel Hauser believes that young men joining the Army should feel that they are becoming part of an elite organization. He feels that the first step in the process would be the revival of the regiments.
Colonel Hauser also believes that identification of soldiers with regiments and their histories rather than with a battalion that is only nominally connected, would compensate for any losses in flexibility for combat organizations. He believes that the Army could profit from the esprit de corps created with slightly different uniforms that could be authorized to distinguish regiments. The Army could be divided into a fighting army and a supporting army and the regiments of the fighting army could concentrate on training for war. Members of the fighting army regiments could take additional pride in their regiment because of its reputation as a combat unit with rigorous standards of discipline.

Captain Sinnreich and Colonel Osborn have provided the most recent plan to revive the regiment, reorganize the Army, and improve the overseas rotation system.

Their plan has three primary mission areas. First, "reactivation of the permanent regiment as the administrative parent of all combat battalions (infantry, armor and field artillery)." Reconstruction of combat arms regiments as active parent organizations with commanders, headquarters, and permanent homes, exactly as the British system but located at multi-regimental depots throughout the United States.
Second, they have recommended periodic rotation of regimental battalions through each of four mission areas—deployed, training, alert, and stand-down in turn, to include overseas deployment. This suggestion is designed to eliminate individual rotation and has merit even though it is not clear how officers will rotate through advanced schooling. There would also be difficulties with assignments outside of the regiments.

Third, the Army command structure would be reorganized to accommodate the first two proposals as well as the three major components of a deployed division, a regimental depot, and a contingency alert force. The proposals have merit, but they certainly are not without disadvantages. Captain Sinnreich and Colonel Osborn recognized that many problems existed as potential barriers to their proposal but the key issue is that no reorganization proposed or undertaken in the past can provide all the answers. Captain Sinnreich and Colonel Osborn represent two more writers who believe that we can and must get more from our organizations and that whatever plan is devised, the history and traditions of the regiments should be maintained.

The United States Marine Corps still maintains its regimental organizations. The Corps has
done this in their own fashion, facilitated by their small size. The Marines impress every recruit with the history and traditions of the Corps. Marine Corps history has always been a mandatory requirement in the training of recruits. The Marine Corps Guide devotes a substantial portion of its pages to the history of the Corps. Histories have been carefully written to credit marines not regiments or divisions with participation in battles at Tripoli, Buena Vista, and the Halls of Montezuma. In addition, they have maintained two or more recruit training centers that provide training on a regional basis rather than at regimental depots. After receiving recruit training marines are assigned to divisions that will further assign personnel where they are needed. Marines may be assigned to any regiment, and no effort is made to establish home regiments. During combat, regiments may deploy intact but combat elements are normally tailored into a marine amphibious unit (MAU) which is built around a battalion landing team. For larger operations the Corps employs a marine amphibious brigade (MAB) which is built around a regimental landing team and an aviation group. These organizations fight with elements of several regiments that accumulate their own honors and histories to share with the parent regiment and the entire Corps.
A great deal can be learned from the suggestions of men who have studied the problems of military organizations from not only the historical point of view, but also from the scientific studies of the sociologists. History, tradition, esprit de corps, honors and pride are important to military units but the social relationships of men in military units are just as important, if not more so.

The earliest internal studies of the Army by sociologists occurred during the Spanish-American War; however, meaningful contributions to army organization did not occur for another fifty years. During World War I a relatively new approach to the use of military personnel received stimulation from social research. Sociologists convinced Army commanders and personnel managers of the advantages and the importance of considering a person's intelligence, skills, and aptitudes in assigning him to a military occupation. For better or for worse during World War II the social research of the previous wars resulted in an elaborate mechanism for matching men's skills to the jobs required. We know now that no organization as large and dispersed as the Army can exist without a standardized personnel selection system.
It was also during World War II that research began into the area of "morale." An excellent summary of this research exists prepared under the guidance of Samuel A. Stouffer and published under the title The American Soldier. Stouffer's observation on "morale" versus organization is:

Thus we are forced to the conclusion that personal motives and relationships are not uniquely determinate for organization in combat... officers and men must be motivated to make the organization work, but not all of them have to be motivated, nor must they all agree on details of social philosophy or be bound by ties of personal friendship in order for a functioning organization to exist. To put it another way, the best single predictor of combat behavior is the simple fact of institutionalized role: knowing that a man is a soldier rather than a civilian. The soldier role is a vehicle for getting a man into the position in which he had to fight or take the institutionally sanctioned consequences.

The point here is that in choosing a form of organization for the Army when "morale" and organization conflict, the organization can still function well. This assumes that the new organization is administratively and tactically as sound as the old organization. Morale was important to the great captains who placed it above many material obstacles and even predicted victory when their forces were in possession of high morale.
An army in action is an example of what may be called a dynamic crowd. Hugh Foster wrote:

"... a dynamic crowd ... [is] an assemblage of men united for common action and inspired by the same ideas and desires."  

Foster did not write a great deal about morale either but he believed that all dynamic crowds possess an essential underlying character which becomes its religion. The religion of a dynamic crowd is best defined with a quotation from an anonymous French psychologist, as "placing all the resources of the spirit, all the submission of the will, all the ardour of fanaticism, at the service of a cause, which then becomes the guide and end of all the ideas and actions of the assemblage."  

To have a religion one must have a soul, a dynamic crowd would have a collective soul. A collective soul is fragile and temporary compared to that of the individuals who are part of the crowd, but, with stimulation, the collective soul can rise to heights impossible for the individual soul to reach. Crowds have been known to commit atrocities from which their component individuals would have recoiled in horror. At other times crowds have shown enthusiasm and devotion, and performed incredible acts of heroism and self-sacrifice which no individual within the crowd could have accomplished alone.
The best recorded acts of heroism of crowds are found in the volumes of military history when groups of soldiers have ignored danger and fought together to gain victory for their cause. Crowds have an overwhelming craving to be led. Leaders can influence crowds by assertion, repetition, and example. Foster says, "Crowds are impressed by coolness, courage, self-confidence, determination, and vigour in utterance and action, and even by personal appearance." What has been said about crowds applies to military organizations. Foster adds, "A mass of soldiers differs from a mob mainly in the habits acquired by discipline, the facilities for action afforded by organization, and the ideal of character which their profession, and their very uniform, suggest to them to live up to . . ."23

Within crowds or military organizations there are subelements which can be called primary groups. The primary group is the individuals immediate circle of associations with common bonds, such as a group of friends, family members, a squad, a section, or buddies. During World War II the crucial contribution of cohesive primary group relations to morale in times of stress impressed sociologists and led to the analysis of group cohesion of the German Wehrmacht.24
The analysis of the Wehrmacht by Edward Shils and Morris Janowitz contained two hypotheses pertinent to this thesis.

First, "it appears that a soldier's ability to resist is a function of the capacity of his immediate primary group to avoid social disintegration."

Second, "the capacity of the primary group to resist disintegration was dependent on the acceptance of political, ideological, and cultural symbols only to the extent that these secondary symbols became directly associated with primary gratifications."

This was expounded in the simplest of terms by Brigadier General S. L. A. Marshall when he said, "I hold it to be one of the simplest truths of war that the thing which enables an infantry soldier to keep going with his weapon is the near presence or the presumed presence of a comrade."

The resistance to primary group disintegration that has been referred to may be no more than group cohesiveness until a point is reached when the group members recognize the proximity of danger. Social cohesion is increased by the proximity of danger and the importance of the group's mission. In theory, as the threat of danger increases, and becomes apparent to the group that the mission is important, the social cohesion of the group will increase.
Janowitz claims that, "this is the great difference between peacetime and wartime military establishments; this is the difference between garrison life and realistic training exercises."27

This is true for the great bulk of the men in the Army. The peacetime modern volunteer Army of today is for most men an eight to five job interrupted by alerts, field duty, and details. There are few urgent military missions in the modern volunteer Army. The most important function of the primary group on alert is to assist the individuals of the group sustain the tensions of maintaining operational readiness. Social cohesion under conditions of extended stress depends almost entirely on the performance of small unit leaders and the availability of rest periods.28 The ability of British soldiers to withstand longer periods of stress in World War II and Korea was not due to the British regimental system. Sociologists attribute the ability of the British soldier to withstand more than twice the stress than American soldiers to the English policy of more frequent rest intervals than prevailed in American units.29

The performance of small unit leaders is another interesting subject. The United States
Marine Corps has made it a standard in the development of the recruit that he be impressed with the idea that he may one day be the leader. Even as a marine private he must prepare himself to assume command. In the Chosen Reservoir Battle in the Korean conflict, there were units of the Seventh Marine Regiment that were so drastically reduced by casualties that non-commissioned officers became commanders and privates led platoons. From the first moment of induction the marine recruit must accept two principal ideas, all marines are infantry men, and all marines are leaders. These are obviously not always truths but they are excellent goals and though they may also produce bravado, there is evidence to suggest that the ideas take hold and assist in the development of leadership.

The Marine Corps has no exclusive claim to the development of small unit leaders by impressing men with a possibility that they might assume command. Some British leaders claimed that the fact that their units could immediately replace leaders, was responsible for the survival of many men who were prisoners of war. During World War II British POWs established elaborate chains of command, insisted on adherence to the Geneva Convention, and maintained someone in the position of command even when efforts were made to
prevent that practice. Often every man in the camp was informed of his position in the chain of command.

To complete a full circle of study it is also important to examine the linkages of primary groups with the larger military and social environment and with the individual. For enlisted men, and some officers, during World War II the scopes of social environment were limited to their own company or their battalion. Whenever the men began to feel battle fatigue and a breakdown occurred in communications to higher commands, a feeling developed that leaders were acting unreasonably. Except for a few officers who maintained contact with the higher headquarters military authority was remote and beyond reach. Since the results of social research on soldiers in Vietnam has begun to appear, a new conception of the primary groups is emerging. Primary groups today are more often two person systems, or buddies. When buddies form a primary group the perspectives of the individual soldiers often go no farther than platoon and company. The battalions of today's Army have the same relationship to the soldier today that the regiment had for the soldier of World War II.

Another important consideration of the individual and the primary group is the matter of a replacement system. Sociologists Robert K. Marton and Alice S.
Kitt believe that the problems associated with the adjustment of individual replacements may have been overstated. They claim that studies which followed men through the replacement stream have all stopped short of his actual integration into a combat unit. Merton and Kitt claim, "Direct observations of this adjustment process indicate that infantry squads can develop informal mechanisms for receiving the replacement."

Though we can learn valuable lessons from reviews of historical precedent, the Army may not assume a permanent configuration because of technological, political and budgetary change, all of which directly influence organization and tactics. Changing technology creates new patterns of combat forcing change in organizations. New organizations often modify organizational behavior and authority in the military establishment. The changes in the organization through innovation are not routine but dynamic.

Change has always occurred. First, there has been a change in organizational authority, a shift from authoritarian domination to greater reliance on manipulation, persuasion, and group consensus. The addition of more field grade officers to regiments and the permanence of the three battalion organizations indicated further delegation of authority and decentralization of command. Second, a narrowing skil
The differential between military and civilian technicians is occurring because of an increase in highly technical specialties in the military. Third, there is a measurable shift in officer recruitment from a relatively high social group to a broader base which are more representative of the American population as a whole. Fourth, the officers, released from the stagnation of the regiment, follow more prescribed career patterns designed to lead to advancement. Fifth, the growth of the Modern Volunteer Army, and its development as a vast managerial enterprise with increased political responsibility, has placed a strain on tradition. Officers refuse to believe that they are just military technicians who lead men and fulfill missions. Enlisted men want to hear the reasons why the mission must be performed.

The future, with its space age technology, promises an even greater measure of dispersion of our organizations on the battlefield with a concurrent growth in battlefield lethality. Some bold predictors have suggested that teams of men could one day roam the battlefield with weaponry capable of massive destruction beyond any conceivable contemporary capability. Those concepts are radically more than what confronts us today but even if we had to face
that situation now, the basic lessons of social research will still have value. Sociologists have said that the most vital characteristics of an organization are: (1) Organizations must be tactically and administratively sound. (2) We must have capable small unit leaders who can maintain social cohesion under conditions of extended stress. (3) We must have an urgent military mission or the capability of managing tension within the primary groups. (4) It is important to consider a person's intelligence, skills, and aptitudes in assigning him or her to a military occupation. (5) Morale is important but only to the extent that it is directly associated to primary gratifications. Sound organizations can be effective without high morale. (6) A soldier's resistance is a function of the capacity of his immediate primary groups cohesion.
CHAPTER 5

SUMMARY AND RECOMMENDATIONS

The regiment was an organization which evolved to provide administration, discipline, and instruction for a number of tactical units. The regiment also provided its subordinate tactical units with logistical support and personnel replacements. The origins of the regiment are closely tied to the close of the Feudal Epoch in 15th century Europe and the appearance of firearms. The early organizations were entirely commercial ventures undertaken by Swiss and German mercenaries, however, they contributed many of the characteristics of permanent professional regiments found in later years. The colonel, the regimental staff, the colors, the regimental depot systems, and the regimental band were all found in the commercial regiments which also developed the tactics adopted by the early permanent regiments.

In the 16th century the French became the first to organize permanent regional regiments but other nations followed rapidly. Sweden's Army of regiments under Gustavus Adolphus was so successful in the Thirty
Years' War that it became the model for organization of all the armies of Europe.

The regiment in the 17th century was an administrative organization. Since the 15th century the battalions of the regiments have been the infantry fighting units. The experiences of the more successful commanders resulted in the formation of a few hundred men into battalions so that each regiment could provide two or three battalions. Because regiments sometimes only formed one battalion, there has been confusion in the terms—battalion and regiment—and even today they are often used indiscriminately.

The early regiments were flexible permanent organizations. The regiments adapted to technological developments which emerged during hundred of years of warfare. The musket, arquebus, and improvements in artillery necessitated modifications but the basic system survived. The British studied the regimental system and adopted it in the mid-17th century. Until 1881 British regiments had ten companies of infantry or dragoons and six companies of cavalry. The British regiments had only one battalion until 1881 and the adoption of Lord Viscount Cardwell's reforms. After 1881 most British regiments had two battalions, one which served in the home territory and a second which
provided a colonial garrison. During wartime the regiment's headquarters remained in its home region while its battalion(s) deployed with a brigade organized for war and commanded by a regimental commander temporarily elevated to brigadier by the king.

Though the British regimental system had faults, it was a proven system permanently established with the leading features of European organization and tactics. English success influenced the Americans to copy the features of the British system when they organized the Continental Army. It was a system that the Americans knew well since many of them had served in British regiments or in the colonial militia regiments in existence in the colonies since 1636.

Though the Americans began the Revolutionary War with the same regimental organization as the British, they modified the system almost immediately. By 1779 with Friedrich Wilhelm von Steuben's guidance the regiments had one, two, or three battalions of two hundred men each to a regiment. Prior to von Steuben's actions to develop uniform standards of training, discipline, and organization Continental regiments were all different since each state had organized its regiments to their own state specifications. Engineer and artillery units served directly under Continental inspection and were not subject to state supervision.
Even though Congress authorized five regiments of artillery, both artillery and engineers deployed by company or smaller sized unit. In addition, as opposed to the British the Continental regiments received their support entirely from their home states. There were no depot systems for recruits or supplies.

After the signing of the peace treaty in 1783, barely seven hundred men remained in the Continental Army. On June 2, 1784, Congress discharged all but eighty men and a few company grade officers thereby completely severing the ties of lineage for all but one unit of the 5th Artillery. Congress reorganized the Army on the following day with an authorization of one regiment with eight infantry and two artillery companies which brought the entire army to a total of seven hundred men.

In 1792 Congress reorganized the Army into the Legion of the United States. The experiment with a legion remained until 1796 when the organization returned to a regimental structure consisting of four regiments and six troops of dragoons.

At the start of the War of 1812 less than seven thousand men filled an authorization of seven infantry regiments, one rifle regiment, one light artillery regiment and a regiment of dragoons. Though
Congress authorized an increase to more than forty-eight regiments of infantry reorganizations by the Congress in 1815 and 1821 reduced the Army to a force of seven thousand men in seven infantry regiments, one rifle regiment and four regiments of artillery. This force was all that remained until the expansion necessitated by the Mexican War.

Following the Mexican War Congress again reduced the Army to a peacetime level of eight infantry regiments, four artillery regiments, two regiments of dragoons and one regiment of rifles. The Army increased only once before the Civil War adding two regiments of infantry, two of cavalry and two of dragoons for a total authorization of eighteen thousand men.

From the Mexican War until its dismissal as an active army organization, there were times that the regiment was not only an administrative organization but it filled the role of a tactical unit. Especially in the Civil War many regiments were maneuvered by their commanders as though they were battalions or large companies.

The expansion of the Union Army for the Civil War was a staggering task but by the war's end Congress reduced the Army to forty-five infantry regiments, ten
cavalry regiments, and five regiments of artillery. The dragoons, reorganized into the Corps of Cavalry in the first year of the war, and cavalry regiments were now uniformly organized with twelve troops in three squadrons. Some infantry regiments had as many as three battalions, with eight companies each, but the reorganization of 1866 temporarily ended the three battalion regiments.

The changes in technology experienced in the Civil War led to more than thirty years of arguments to reorganize the infantry regiments. The European armies all had multiple battalions and even the British Army had changed. Because of ever widening battlefields and increasing dispersion the old regiment was too spread out for one commander to handle in combat. The officers frequently lost control even in companies and a system of internal organization of platoons, sections, and squads did not receive serious attention until after the war.

The major changes of the period following the Civil War included an increase in cavalry regiments at the expense of the infantry and finally on the eve of the Spanish-American War Congress authorized a reorganization of infantry regiments to three battalions each. After the Spanish-American War the Army found its position had drastically altered. Congress charged
the Army with the responsibility of providing men for garrisons in Cuba, Puerto Rico, and the Philippines. In addition, the professionalism of the Army and the capability of its organizations received challenges from the administration and the press.

Life in a regiment to the beginning of the 20th century was a hard existence, often filled with moments of terror, and months of boredom. Regiments moved about the country so often that they rarely formed as a unit. Most of the posts across the country were too small for a regiment, some could only hold a company. The rates of desertion, and court-martial indicate that the often touted high morale of the units was rare. The regiment was an excellent organization for its time but by the turn of the century its time was quickly passing. It is also important to remember that the regiment prior to the Spanish-American War was no larger than one of the battalions of the 1940's and 1950's.

The turn of the century saw Elihu Root appointed as Secretary of War. Secretary Root led a series of movements to reorganize the Army which culminated in attempts to organize peacetime divisions, an Army War College, mobilization planning and a permanent efficient general staff. Congress also required the
Army to provide overseas garrisons. Though overseas garrisons were permanent, the personnel that filled the ranks of the overseas regiments came principally from stateside regiments who detached volunteers, or ordered members to serve two year tours. Depots in New York and California provided support for the overseas regiments eliminating the need for overseas units to train raw recruits or to operate their own resupply system.

Though the Army experimented frequently with peacetime divisions the National Defense Act of 1916 provided the first peacetime authorization for division organization. Though the Act had an effect on the development of the division, the regiments remained about the same within the three battalion structure until the organization of the World War I square divisions.

The static trench warfare of World War I required a regimental organization with a strength nearly double that of the pre-war regiments. The regiments of the square division contained over thirty-seven hundred men in three battalions made up of four companies each. Each company had two hundred fifty men. The regiment also had a headquarters company, a supply company, and a machine gun company. Technological
developments such as the machine gun, improved artillery, gas warfare, barbed wire, and elaborate field fortifications made the horse cavalry regiment obsolete for all but a few missions. Because of its vulnerabilities, horse cavalry began a decline which would not reverse itself until its abolition.

The replacement system of World War I contributed its share of damage to regimental lineage. The critical need for replacements in committed units led to the break up and redesignation of many proud old regiments. In addition, men from the Regular Army, National Guard, and the National Army lost their separate group identities completely as the Army absorbed them into the same units.

Army strategists believed that the square division would find no place in future wars and efforts began immediately to find a division organization to replace it. The infantry regiments led the reorganization in the early 1920's with the elimination of a rifle company from each battalion and reductions to three Platoons in each company. Machine gun companies replaced the eliminated rifle company bringing the machine guns under battalion control. In 1933 the cavalry began development of mechanized cavalry regiments. By 1935 experiments by Army developers were leading to the adoption of triangular divisions.
The period between the world wars could be called the height of the regiments peacetime history. Life in the regiments for the commissioned officers was one of pomp, ceremony, and privilege. The Army, victorious in the great war, received appropriations for quarters, commissaries, theatres, post exchanges, and many other facilities. Enlisted men addressed the officers in the third person but clothing, equipment, quarters, and subsistence had improved to the point that comparisons with previous decades showed great strides forward. The Army also rode out a great depression with advantage over many civilians. In addition, a remedy for the depression took the form of increased government spending to place money into circulation. The Army received its share.

The beginning of World War II found the Army in a traditional pre-war posture but the lessons on mobilization learned from World War I did not go to waste. The Army implemented the triangular organization in all its regular divisions and the National Guard followed suit immediately upon its activation. Armor divisions eliminated the regiments in favor of combat commands. The infantry divisions also applied modifications except they formed regimental combat teams for specific missions by grouping combat elements around infantry regiments. With triangularization
the Army permanently eliminated field artillery regiments and by 1943 the regimental organizations disappeared completely from the service troop organizations. Only the infantry regiment survived the reorganizations during the war. The infantry regiment had grown back up to almost thirty-seven hundred men. An increase in the strength of rifle companies was the most dominant factor but the regiments also added an anti-tank company, military police, additional supply and service personnel, communicators and a number of new weapons developed in the war.

The regiment grew again in the 50's but the adoption of the national policy of "Massive Retaliation" led to reorganization in 1956 to the Pentomic Army. The Pentomic reorganization meant the end of the infantry regiments. Only through the introduction of the Combat Arms Regimental System (CARS) was the Army able to retain the histories and the traditions of all its regiments. CARS proved itself as an effective flexible system when the Army reorganized in 1964 under Reorganization Objective Army Division (ROAD). Under ROAD only five armored cavalry regiments remained in the active Army organization.

Before the Army retired the regiment there were men who wrote in defense of the regimental system
and recommended its retention. It is important to recognize that all of the men who recommended retention of the system and those who later recommended its revival never advocated a return to the pre-World War II system. The advocates of the regimental system primarily urge the adoption of features of the British regimental system. Most believed that the regiment should not be a tactical unit, that battalions should be independent organizations from the standpoint of logistics and combat support to allow them to be attached to combat commands or teams. The primary motives for retaining the system were to retain the histories and traditions of the regiments and use them in development of spirit de corps and morale. Writers added Army rotation policies to the list of reasons to retain the regiment because of the regiments potential for home regiment rotation plans. However, Army experimentation with gyroscope and other rotation plans defeated the arguments for home regiment assignments because tests showed that type of system as either impractical or disliked by American soldiers.

The British regimental system prior to 1891 bears little resemblance to the British system of today. Since 1891 the British organized regiments with multiple battalions using Regular Army, Territorial Army, and conscript personnel. Some
centralized training and assignments between regiments are common. British infantry regiments are grouped in divisions today and infantry soldiers receive assignments to divisions and can serve in any regiment. British regiments have still retained their histories and traditions but during both world wars the British system barely survived. There have been numerous attempts by British leaders to change the system and almost all have been stubbornly rejected. The British have resisted change primarily because the wealth of history and tradition have done a great deal to promote esprit and provide standards of behavior that simplify the task of command. It should be noted that it is not just the British regiment and its history that are responsible for the high morale of British regiments. British policies require more frequent rest in combat, the relatively small size of the Army helps, "hometown" duty assignment is an asset and many other small things that have little to do with the sort of organization provide the lion's share of support for esprit de corps and morale.

Many features of the British regimental system that encourage its longevity are not advantageous for the American Army. Americans seem to enjoy the opportunities of mobility within the Army. The American Army since World War II has assigned men to
military occupational specialties according to their intelligence, skills, and aptitudes. The British are forced to take men from their assigned recruiting area and make assignments wherever vacancies occur.

Sociologists are playing an ever increasing role in the study of Army organizations and personnel. Sociologists have claimed that an administratively and tactically sound organization is more important than personal motives and relationships, or simply the organization is more important than morale. However, if we can have both a sound organization and morale the Army would enjoy a considerable advantage.

In the United States Marine Corps morale is achieved in a unique way. Marines hang their history on their Corps, little of it is lavished on individuals. Even though the Corps has had its individual heroes, it seems as though they have shared in glory which has primarily been bestowed on the Corps.

Combat Arms Regimental System (CARS) has done an outstanding job of preserving the regiment as a vehicle for Army history and traditions. The regiments live in CARS and even though the headquarters is inactive there is something to build on and now there is a meaningful system of designating units.

Perhaps the key to increasing morale and achievement in today's organizations lies in developing small
unit leaders, men who can influence the mass of soldiers that can be termed dynamic crowds. Those men must understand what impresses or motivates military organizations. The small unit leader has taken the place of the regimental commander as the crucial individual in the management of stress and the development of high individual morale. This is because the primary groups, those groups most important to the individual soldier, have dwindled to buddy relationships. Outside of their primary groups, under the danger of combat or the tension of maintaining operational readiness in peacetime, the soldier not only finds it difficult or impossible to develop a close relationship but outside of one or two superior groupings he may find that he no longer trusts the organization.  

The principal functions of the primary group are to resist in combat, to accomplish the urgent military missions of combat, to provide a mechanism to sustain stress in periods of peacetime and to avoid social disintegration. Consequently, the role of the small unit leader becomes the most critical key to the question of the value of the regiment. The individual soldier would benefit more from attempts to develop esprit and morale by development
of small unit leaders than by the revival of the regiment. Studies of the individual and the replacement system add additional support. Observations of infantry squads have shown that they can develop systems to receive new replacements, something the early American regiments found difficult.

From the preceding chapters we are reminded that several hundred years have elapsed since the invention of gunpowder until this substance forced a drastic change on organization. With the invention of nuclear weapons we have observed approximately the same degree of change in a ten year period that occurred in roughly the equivalent of what was done in five hundred years with gunpowder. The changes in organization that occurred from the triangular organizations to ROAD were urgently needed to maintain a viable defense and a capability for retaliation. General Hans von Seeckt said, "In army organization, it is dangerous to mistake a momentary condition for a permanent one, and to overlook the fact that an army organization is a living organism which in form and spirit must keep step with the times." ² Major General Charles V. Bromley said, "The Art of War constantly changes. To adopt a hard, fast, and unyielding belief in the efficiency of a given type organization,
a tried tactic, or an existing piece of equipment is
dangerous." Colonel Clifford Walton, of the British
Army said, "Every trifle, every tag or ribbon that
tradition may have associated with the former glories
of a regiment should be retained, so long as its re-
tention does not interfere with efficiency."

We cannot return to the regimental system of
the early 1950's because we have learned that bat-
talions must be self-sufficient, logistically, and
in combat support. In addition, we know that the
communications of the regiment of the early 1950's
was inadequate. And we have learned that the regi-
ment did in fact lack flexibility. The rising costs
of maintaining the Army shows that we cannot afford
the luxury of an administrative headquarters, or the
addition of another level of command. The possibility
of tactical nuclear warfare does in fact require that
organizations be made up of a mix of individuals from
differing geographic origins to prevent dispropor-
tionate losses to specific areas. The change in wea-
pons technology alone would have forced another or-
ganizational change had the basic system remained.

From the preceding comments it is obvious that
as a system of organization, the regimental system is
obsolete and little remains of it that the modern Army
could make use of. There are some things that exist
from that system that are useful such as the history and tradition. However, some traditions widened the gulf between the Army and its soldiers. In the past few decades hundreds of harmful "traditions" have disappeared. In 1957 the Army officers and enlisted men began to wear "Army Green." In the past it had been tradition for the officers to wear a distinguishing uniform. However, it was recognized that the practice began to breed hostility especially in light of growing movements toward individual rights. The practice of enlisted men addressing officers in the third person was also a tradition which only served to further insulate the officers from the enlisted men.

There are many things that we may have believed about the regiments that were not true. It was not always possible to choose the regiment that you wished to serve with. Not everyone enjoyed a familial atmosphere in their regiments. Unit rotation systems to some individuals meant stagnation, no chance for advancement, or opportunity to change occupation. Regiments did not have permanent homes. They may have had permanent headquarters locations, or a post or base which they called permanent or home because their families resided there or because they returned there frequently.
Over the entire span of American history from 1775 to 1957 the regiments did not even enjoy consolidation into regimental formation until 1930, except in wartime.

The strongest recommendation that can be made from this paper is to treat regimental history and traditions as Army history and Army tradition. The modern Army has begun to copy the techniques of the Marine Corps rather successfully. Soldiers magazine is a classic example. Soldiers, like Leatherneck or The Marine Corps Gazette, is designed for a mass audience of soldiers not addressing one element. Army recruiters and personnel offices are also moving in the same direction. Unit of choice options should have been dropped long ago. They are being discontinued now and advertising is using the Army at large as an organization. Personnel offices operate on an area basis with unit Personnel Services NCO's. This is efficient and it fits the way the soldier thinks. The soldier sees the Army as a green machine, when he can identify with it and feels he is a part of it and most importantly when he is familiar with the way it works, its history, and its benefits, he begins to find its benevolence. Only if it remains as another stranger or as a hostile element will he refuse to associate with it.
Honorary organizations, symbolic headquarters, the use of volunteers and all the other proposals to squeeze a little more out of CARS are fruitless exercises in futility. Honorary regimental organizations exist all over the United States. Every issue of the *Army Times* contains notice of meetings, reunions, and information on current association officers. These notices are designed to appeal only to former members. Someday each notice for a regimental reunion will appear for the last time. The same thing could happen to any regimental association, because it is forced to compete for the soldiers attention with the Association of the United States Army, the Non-Commissioned Officers Association, the division association, post associations, and veterans associations.

Thus, the regiment should not be revived as an active Army organization. Additional study should be done in the fields of social research and cost effectiveness. A comparison should be made between the cost of a similar organization in the American Army. There is reason to suspect that even though pay is comparatively lower for the British soldiers, the cost of training and maintenance of the soldiers may be proportionately higher. In doing the suggested studies primary effort should be placed on the identification of specific factors of British or American systems that develop esprit de corps and morale.
Any actions toward development of the small unit leader are positive steps in the right direction. The Non-Commissioned Officers Education System (NCOES) is an outstanding example of the type of NCO development essential to the development of an administratively, and tactically sound organization with esprit and high morale.

Present Army histories are a barrier to an effective implementation of the advanced phases of CARS. As Mark M. Boatner discovered while researching Military Customs and Traditions:

I am unable to provide several pages of interesting U. S. regimental traditions. They are not available from official Army historical sources. There is no point in digging them out of old military history books. The only legitimate source is the regiments themselves—nothing can really be called a regimental tradition if it is not well known to the men serving in that regiment today.

Army historical efforts are improving but a great deal remains to be done to include the soldiers in the Army's histories. It is difficult to find excerpts from history which relate the life of the enlisted man on the frontier or in the battlefields of Korea. Gaps exist in the history of the soldier throughout our Army history even though tons of writing have been done on our leaders.
Phase V of the CARS plans called for assignment of parent regimental headquarters to permanent locations and performance of support functions by those headquarters. The type of support functions envisioned were maintenance of regimental history, traditions, and a set of records of members of the regiment. In addition, the regimental headquarters would conduct regimental recruiting, supervise reserve personnel, and operate regimental training units. It would be needless repetition to examine each of these points. It should be sufficient to say that the phase is impractical and not in keeping with the times. Finding ourselves in "future shock" as described by Mr. Alvin Toffler, we cannot afford to encumber ourselves with administrative requirement that we can avoid especially when their value is not clear. All the regimental headquarters should be assigned enmass to their respective branch and school centers. At the centers the colors and trophies can be displayed in center museums. Most center museums have a "Hall of Flags" which provide an excellent setting for the regimental colors. The colors of the infantry would be assigned to Fort Benning, Georgia, the armor and cavalry to Fort Knox, Kentucky, the artillery to Fort Sill, Oklahoma, the air defense artillery to Fort Bliss, Texas, the signal units to Fort
Gordon, Georgia, and airborne and special forces regimental colors can be housed in the museums at Fort Bragg, North Carolina.

It is believed that the assignment of the regimental headquarters to centers with their colors is entirely appropriate. It is at the centers and schools that the bulk of new officers and enlisted men receive their basic training and their initiation into Army organizations.

The regiments of the United States Army provided the nation with a rich heritage of proud traditions and stirring history. It is altogether fitting that every scrap of evidence of that history be retained within the capability provided by CARS. It is entirely proper to treat the inactive regiments as units that have been replaced by organizations that are better prepared to fight on modern battlefields. Finally, modern Army organizations have demonstrated an ability to cope with peacetime and wartime stresses that can be expanded with the development of small unit leaders.
CHAPTER 1

Webster's Seventh New Collegiate Dictionary defines regiment as: 1. governmental rule; and 2. a military unit consisting of a variable number of battalions or other units. Charles James, Military Dictionary, 3d ed., London; T. Egerton Military Library, 1810, pp. REG REG provides the earliest definition available. "A term applied to any body of troops, which if cavalry, consists of one or more squadrons, commanded by a colonel; and, if infantry, of one or more battalions, each commanded in the same manner. The squadrons in cavalry regiments are divided, sometimes into six, and sometimes into nine troops. The battalions of British infantry are generally divided into ten companies, two of which are called the flanks; one on the right consisting of grenadiers and another on the left formed of light troops. There is not, however, any established rule on this head; as both cavalry and infantry regiments differ according to the exigencies of service in time of war, or the principles of economy in time of peace..." James continues on but really does not pin it down. William Duane, Military Dictionary, Philadelphia, 1810, pp. 542-83. Duane may have compiled one of the earliest, if not the first, American edition of a military dictionary. However, there is some possibility that he may have borrowed from the James dictionary since they differ only slightly. Army Regulation 310-25, Dictionary of United States Army Terms, Headquarters Department of the Army, Washington, D.C., June, 1972, "regiment—administrative and tactical unit, on a command level below a division or brigade and above a battalion, the entire organization of which is prescribed by table of organization. The commanding officer of a regiment is usually a colonel," p. 438. The regiment has often been compared with the brigade as an equivalent organization. Initially the
brigade evolved to provide the tactical organization that the regiment could not provide without a great deal of modification. When the brigade became a unit of the American Army it was to provide a tactical formation of two or three regiments. The formation of brigades was only permitted in wartime and was to group units of similar type or with a similar mission. This action provided for a massing of a number of regiments combat power. The combat power of a regiment was tactically its battalions. The regiments were at different levels of strength from 430 to 1,000 men that were neither large enough to fight independently nor standard enough to be placed against opposing regimental forces with any assurance of achieving parity in strength. Brigading became one option which remained.

2. AR310-25, Dictionary, "battalion - unit composed of a headquarters and two or more companies or batteries. It may be part of a regiment and be charged with only tactical functions, or it may be charged with both administrative and tactical functions," p. 82; "division - a major administrative and tactical unit/formation which combines in itself the necessary arms and services required for sustained combat, larger than a regiment/brigade and smaller than a corps," p. 188.

3. The statement that the regiment was an administrative unit can be supported in many ways, the etymology of the word is from the French Regie, Management, and the Latin regere, to govern. Today etymologists trace the word regimen from the French regime, which signifies system, regiment, administration, and which again can be traced to the Latin regere. Consideration must also be given definitions within American Army Regulations. In the Army Regulations of 1889, Article XXXI, the regiment is composed of one or more battalions, each containing a designated number of companies. It is formed for purposes of administration, discipline, and instruction. This definition can be found valid until December 15, 1924, AR235-5, REGIMENTS, para 1a, "The regiment is both an administrative and a tactical unit." Para. 1b, "In the Infantry, Cavalry, Field Artillery, Coast Artillery, Engineers, and Chemical Warfare Service the regiment is an administrative unit." There was no other type of regiment in the Army at that time other than those listed in para. 1b. See Hubert Foster, Organization, London: Hugh Rees, Ltd., 1913, p. 172.

7. Dupuy, Encyclopedia, p. 427. The French Army consisted of fifteen "compagnies d'ordonnance," of about six hundred men each. "Compagnies d'ordonnance," are companies of armed men. This is the period of the beginning of experiment in the reorganization of armies. Tactics are tested for the use of gunfire. The massive formations of men in phalanx and square begin to disappear.

8. Commercial basis - A profit making operation with investors somewhat like a small stock company. The Italians called the companies "Condottieri."

10. The German Reiter (or Ritter) were the first "modern" cavalry. They were organized like the Landsknechtes and at about the same time.

11. When a man committed a crime which disgraced his regiment, the complaint was brought to the ensigns, who thrust their colors point downward into the ground, vowing that they would not be carried by the regiment again until expiration of
the dishonor. The result of this action was that the men of the companies investigated each case themselves, without the intervention of officers. If the men found the culprit guilty and he received appropriate punishment for his actions, the ensigns could again carry the colors. The colonel waved the colors over the head of a man who had paid for his crime and, after this action, the men of the regiment considered the infamy removed.

12. Maniple: A subdivision of the Roman legion consisting of either one hundred twenty or sixty men.

13. Cohort: One of ten divisions of an ancient Roman legion.

14. T. J. Edwards, Standards, Guidons and Colours of the Commonwealth Forces, Aldershot, England: Gale & Polden, Ltd., 1953, pp. 1-6. Historians have argued that this may be the origin of the regimental commander's insignia, the eagles of the colonel.

16. Dupuy, Encyclopedia, p. 458. John Fortescue, The Empire and The Army, London: Cassell & Co., 1928, p. 12, Footnote 1. A "cabo de colonela" (head of the column) commanded the Columna, a title which has been said to be the origin of the word colonel.

17. Montross, History, p. 212. Congress authorized five regiments of artillery by the end of the war. However, the fifth was primarily an armorer and artificer regiment.

20. From the fifteenth century onwards the battalion was always the fighting unit of infantry. In the early sixteenth century when in some countries the commercial company was only a large administrative unit, the battaglia were its tactical
subdivisions, and formed small units fighting separately. Hence, for a short period of time, battaglione, "the great battaglia," was the name given to a large fighting unit and often consisted of a mass of men comprising several regiments. The experience of the more successful leaders pointed eventually to forming a battalion of a few hundred men, so that two or three could be furnished by a regiment. Instead of forming a huge battalion of several regiments. The fact that sometimes the regiment formed only one battalion accounts for the constant confusion between the two terms, and their indiscriminate use even today.

21. Each battalion consisted of four companies of one hundred fifty men, seventy-five musketeers and fifty-nine pikemen with officers and non-commissioned officers holding the remaining sixteen positions. In Gustavus' Army the men referred to the battalion by the Italian name battaglia.

22. Montross, History, pp. 268-273. See Foster, Organization, pp. 176-189. Both Gustavus Adolphus and Maurice of Nassau formed their armies for battle in what they referred to as Swiss fashion. The formation was with three lines called van, battle, and rear. Each of the lines constituted a brigade, a new and infinite unit composed of several regiments totalling any number of men. This was the first introduction of the term brigade which was derived from the Italian briga, French brigue (a quarrel), and meant "a band of opposing combatants."

26. In the French Army from 1684 to 1850, the French confined the term of regiment to the cavalry and artillery. The infantry used the term half-brigade. James, Dictionary, p. REG REG.

28. Barnett, *British Army*, pp. 84-88. Cromwell's cavalry, called "Ironsides," provided a decisive edge at the Battle of Marston Moor, July, 1644. Cromwell attacked Rupert's Royalist Forces late in the day. Rupert believed that the day's fighting had ended and called for his supper. Cromwell's forces fought for an hour until Rupert and his men withdrew on the run. After Cromwell recognized the victory on his flank he rallied his men and attacked the opposite flank which was under the protection of Royalist Cavalry commanded by Lord George Goring. Cromwell's forces scattered Goring's cavalry and deprived of the protection of cavalry the Royalist forces were rapidly mowed down. With the defeat of the Royalists at Marston Moor the Royalists lost an entire Army and the north of England.

32. Britain found herself needing protection for colonists from Indians, for the internal defense of her people, and for troops to back her treaties and alliances. In 1685, Monmouth's rebellion occurred and because of it the addition of nineteen regiments to the British Army. Of these new units six were dragoons, two hussars, nine foot and two regiments returned from foreign service. Barnett, *British Army*, pp. 113-116. In these passages Barnett has given us two things, first, an explanation of how the British regiments trace their lineages, and second, a comparison of the same problem we have in the Combat Arms Regimental System (CARS). See R. R. Lamison & John W. Wike, *Combat Arms Regimental System, Army Information Digest*, September, 1964, 19 (No. 9), pp. 16-39 and *Outlines of History of Regiments United States Army*, Statistics Branch, General Staff, War Department, Washington, D.C.: May 1, 1921.
33. Fortescue, British History, p. 31. Except for the change brought about by invention, the British Army was to remain about the same for the next two hundred years. Actually it was not an Army because three national establishments composed the British system. They were the establishments of England, Scotland and Ireland. In 1707, England and Scotland united, and, by 1391, all three had united. In addition, the regiments were the largest peacetime organizations, surprising in consideration of the fact that since the British regiment was not a tactical unit the British battalions became the largest peacetime tactical units.

34. The practice of naming the regiments after their commander remained until 1757. After 1757 all regiments received numbers. In addition, the regiments also adopted the name of the home county or region. The French used the province for the regiments name.

35. Walter Millis, Arms and Men, New York: New American Library, 1956, p. 15. Fortescue, British History pp. 31-33, 36. Barnett, British Army, p. 136. It is interesting to note that until the end of the eighteenth century it was a duty of the Army to man the fleet.

CHAPTER 2

1. Russell F. Weigley, History of the United States Army, New York: Macmillan Co., 1967, p. xi. Weigley's philosophy is that in a historical study, in order to trace the regiment in the United States Army, it is essential to examine two armies, a regular army of professional soldiers, and a citizen army of reserves of militiamen.

2. It was common practice to include men with military experience in every colonial company.
In December, 1636, an act was passed which organized the trained bands into regiments.

First Reg. - Suffolk Reg./1 mounted co. & 15 foot cos.
Sec. Reg. - Middlesex Reg./1 mounted co. & 15 foot cos.
Third Reg. - Essex Reg./1 mounted co. & 13 foot cos.

In 1643, the Sergeant-Major became regiment commander. Sergeant Major reported to the Sergeant-Major-General. The principal staff officer was the Surveyor-General of Arms, custodian of the colony's supply of ordnance, arms, and ammunition. There are two units today, the 182d Infantry Regiment and the 101st Engineer Battalion, that trace their lineage to the North and East Boston regiments both of which are descendants of the Suffolk Regiment.

2. Weigley, History, p. 3.
4. Weigley, History, p. 28. Initially the British regiments were shattered; but, eventually they developed tactics successful enough to defeat the French and to make a decent showing against the Indians. Hubert Foster, Organization, London, England: Hugh Rees, Ltd., 1913, pp. 137, 212-213. The British considered the organization of the American Army to be along completely original lines. British and American regimental commanders both had their own companies within their regiments until 1803 when the British regimental commanders relinquished control of their own companies and generally remained with the regimental headquarters. By 1809, British regimental commanders no longer deployed to combat zones with their regiments, instead they deployed their battalions under command of majors and remained with the Headquarters and Depot to supervise the recruiting, training, and administration. Some British regimental commanders did go to the combat zone, but not as regimental commanders. Some regimental commanders who displayed exceptional ability were made brigade commanders during the period of hostilities. Within a combat zone the British chain of command after 1809 went from company to battalion to brigade and
then to division. The Americans maintained a commanding division and for the regimental commander only until the reorganization of 1774. The American Army regimental commander commanded the regiment through battalion commanders who were majors. When American regiments had only one battalion the command was often split with the colonel in command of a portion of the regiment and a lieutenant colonel or major commanding another portion to accomplish more than one mission. American wartime organizations also retained the regiment within the chain of command as another level between battalion and brigade.

10. It is admitted that 38 regiments may not be precise; however, sometime in 1775, I believe that was correct. United States Department of the Army Lineage Series, Infantry, (Part I), Washington D.C.: U. S. Government Printing Office, 1972, pp. 4-5. "By December, 1775, there were forty-nine infantry battalions (or regiments for the two terms were virtually synonymous) and several unattached companies in the establishment... The legislators set the size of the army around Boston at 20,372 officers and men, to be organized into twenty-seven regiments and some separate companies. In this scheme New England, which had supplied forty-two in 1775, provided twenty-six Continental regiments in 1776. These twenty-six were numbered from the 2d through the 27th. They were designated Continental infantry in an attempt to transfer the men's loyalty from the states to the Congress." Weigley, History, p. 62. "The Continental Army of 1775 comprised thirty-eight regiments of greatly varying size... The key tactical unit was the battalion, which was usually the same body of men as a regiment, "regiment" being another term denoting an administrative unit, while "battalion" was the tactical term."

11. There is an exception, regiments of artillery retained their Continental numbers. Artillery required the type of technical training and experience that required its maintenance in peacetime. It also required equipment that was difficult for a state militia organization to maintain.

13. Files were formations of two men, one in the front rank and one in the rear rank. The two men learned to fight together and were the origin of the squad or more correctly the fire teams of today. A battalion of infantry would total three hundred twenty men, which is a good reason for many arguments that the regiments were no more than battalions and the terms should be used synonymously. Do not accept that argument too willingly; to accept that point makes too many other organizational mysteries unfathomable. A battalion of artillery was something else again. From 1775 and Col. Richard Gridley's artillery regiment there were ten to thirty-two companies in a regiment. Each regiment should have had four battalions and each battalion had two to ten companies. Most often battalions were of three companies of artillery and one company of artificers. The term corps was frequently used because I feel it just meant body or organization for lack of the knowledge of a correct organization. Legislators were not always versed in Army terminology, they still are not. Battalions and corps were occasionally used synonymously, as were regiment and battalion. See William E. Birkhimer, *Historical Sketch of the Artillery U.S. Army*, Washington, D.C.: James J. Chapman, 1884, pp. 1-3. Foster, *Organization*, pp. 19-22.

14. Congress set the size of the tactical battalions at one hundred sixty files in 1776. This size was for battalions of infantry or as incorrectly referred to occasionally, regiments. Regiments of artillery were measured by the number of companies from eight to twelve, this number varied, the number of mattresses also varied, changing the aggregate. In the reorganization of 1776, Congress prescribed the Army as eighty-eight infantry regiments of 728 officers and men each. The infantry regiments organized into eight companies, each company consisting of four officers, eight non-commissioned officers, two "drums and fifes," and seventy-six privates.

15. The administrative unit was the regimental base (the headquarters and staff) and the battalion(s). Weigley, *History*, p. 62.

17. Birkhimer, Artillery, pp. 6-7. There were, in fact, five regiments of artillery authorized; however, the 5th was a regiment (battalion) of artificers. This authority came from George Washington on December 12, 1776, after he had received from Congress power to "order and direct all things relative to the department and operations of war." The 5th Regiment, being an artificer battalion was made subordinate to the "Department of the Commissary-General of Military Stores." In 1780, Congress reorganized the artillery to ten companies per regiment with a total authorized strength of 2,646 men.

18. The Congressmen argued that a standing force posed danger. To establish a standing Army would be to accept a European import that had been designed in the first place to buttress monarchy. Even if American circumstances minimized likelihood of despotism, creation of the instrument some Congressmen believed was the first step to a more centralized and more powerful government than was wise. The memory of the betrayal of the British monarchy by Cromwell in 1650 was not forgotten.

20. In 1791 this unit was formally designated the 1st Infantry. The First American Regiment from 1784 to 1 January, 1792 had for its commander Josiah Harmar of Pennsylvania. From 1784 to 1787 Harmar's regiment contained eight companies of infantry and two of artillery. This unit was redesignated 3d Infantry in 1815.

22. On the North American Continent from December, 1636 to March 3, 1855, "horse" troopers were called dragoons. The traditional light dragoon soldier was trained and equipped to fight mounted or dismounted, to perform screening and reconnaissance, and to act as a scout or messenger. When the American Revolution ended in 1783, Congress ordered the discharge of the remaining fragments of the continental Dragoons. They had never surpassed
four regiments of approximate size for the entire effort. During the next fifty years mounted organizations existed in the Regular Army only for brief periods. A squadron of dragoons added in 1792 disbanded before completion of the organization. In 1796, the Army returned to a regimental-type organization and the mounted portion was organized to two companies. In 1800, the two old companies dismounted and two years later they disbanded.

23. In 1870, Major General William T. Sherman stated that, "the reason why the Army abandoned the legions is that it was a fine tactical unit but the modern regiment was better adopted to administration." Walter Millis, American Military Thought, New York: The Bobbs-Merrill Co., 1956, p. 163.

25. In 1799, because of the threat of war with France, the authorizations went way up. However, only the 1st and the 4th Regiments got to the required strength. A total of 3,400 men enlisted for the 5th through 16th Regiments, but none for the others. By 1800, the crisis ended and a new administration that feared a standing Army rapidly reversed the buildup and cut the infantry back to two regiments.

26. Heitman, Historical Register, p. 579. A paper army, the actual strength on January 29, 1810, was 6,488.

28. Heitman, Historical Register, pp. 572-573. The Engineer Corps included twenty-two engineer officers and one hundred thirteen enlisted men. For the first time two hundred fifty cadets with direct authorization to the academy appears.

29. In the first six months of the war there were three different-sized regular infantry regiments. The 1st and 2d Regiments had ten companies, each with seventy-six privates. The 3d through the 7th Regiments had two more officers each and seventy-eight
privates in each company. The 8th through 11th had eighteen companies arranged in two battalions per regiment.

31. Ganoe, History, p. 159. Heitman, Historical Register, pp. 578-579. Army Lineage Series, Infantry, pp. 14-15. Weigley, History, pp. 139-140. There were eight military districts but not enough of the Army remained or had ever been completely filled and organized to fill out eight regiments so only seven were immediately filled. Birkhimer, Artillery, pp. 44-45 says there were nine military departments, five in the north, four in the south. See Ganoe, History, pp. 162-163 for best description of artillery posting.

33. General Regulations for the Army or Military Institutes, 1821, Philadelphia, Pa.: M. Carey & Sons, 1821, Article 44.

34. The Army had been able to maintain peace on the frontier by demonstrating the presence of its forces rather than by fighting. With the reduction in strength the Army's forces spent most of their time in garrison constructing barracks and farming. They were not able to maintain patrols and the Indians could rapidly judge the weakness. See Francis P. Prucha, Broadax and Bayonet, Lincoln Nebraska: University of Nebraska, 1953.

36. Millis, Arms and Men, pp. 48-50.

39. The following force which represents approximately one-half of the entire Regular Army was the force which fought the bulk of the Mexican War and was the initial force accompanying Taylor.

Aggregate 4,049

41. Heitman, Historical Register, pp. 590-595. There were five acts of reorganization for the Regular Army, two in May-June, 1847, two in February-March, 1847, and one on August 14, 1848.

42. Ganoe, History, pp. 228-229.

43. Weigley, History, p. 189. Fayette Robinson, An Account of the Organization of the Army of the United States, Philadelphia, Pa.: E. H. Butler & Co., 1848, pp. 28-29. Robinson wrote that each regiment should consist of two battalions, each battalion of two grand divisions, and each grand division of two companies. This was his opinion, but it generally reflected the thinking of the times that the regiment should have two or more battalions and that companies should also have a refined infrastructure of Platoons, sections, half-sections (squads), and two files (four men fire teams).

44. Regulations for the Northern "Volunteer" Army were revised on May 1, 1861 and published for the benefit of all northern components. The regulations for the CS Army were written by William Gilham, under the title of Manual of Instruction for the Volunteers and Militia of the Confederate States. Gilham was a colonel of volunteers, instructor of tactics, and Commandant of Cadets, Virginia Military Institute. Gilham wrote his manual and completed it by December, 1860.

46. In 1855, service outside of the United States was west of the frontier, except for California and Texas.

47. Secretary of War Report, 1858, an enclosure, dated December 6, 1858, pp. i-iv.

49. Army Lineage Series, Infantry, p. 24. Extract from the Report of the Secretary of War, 1861, December 1, 1861, p. 22. "The organization of the increased force, it will be noticed, is different from that of the old Army. This question was fully considered by officers of the Army connected with this department, and, after much deliberation, it was concluded to adopt the French regimental system of three battalions to a regiment. Each battalion is commanded by a major, with a colonel, and lieutenant colonel for the general command of the regiment. This, it is believed, is the best organization now existing. The number of field officers is less than under the old system, and, therefore, much less expensive. Whether this organization may not advantageously be extended to the old Army, after the passage of a law providing for a retired list, is a question which may properly engage the attention of Congress."

50. The leaders in authority did not believe that there was time to bother with reorganizing units that were already formed, especially since so many units still remained to be organized. In addition, the old one battalion regiments were a part of tradition that could not be discarded. Finally, the newer three battalion organizations were larger than the old one battalion regiments and the change would have required additional personnel.

During the Civil War, some cavalry companies began to call themselves troops. For many years the smallest unit for administrative purposes in the cavalry was officially the company. The word troop had first officially been used in an act of 17 July, 1862, which prescribed the organization of a "company or troop." The next step came when the revised regulations of 1873 omitted company. Yet for almost ten more years the U. S. Army had cavalry companies. By 1881 many units were using the newer term, and in 1883 all were directed to use it. Still later, however, it was not unusual for both terms to be used in the same regiment.

In forwarding recruits, the party was placed under charge of one of the recruits. A member of the recruiting party was not sent with recruits. In the absence of special instructions, recruits were enlisted for the regiment only, and forwarded to regimental headquarters for assignment to companies.

The object of regimental recruiting was to give the different regiments opportunity to obtain their own recruits by sending out traveling recruiting parties, consisting of their own officers and men. The system produced good results, as it was conducted by officers and men immediately interested in the quality of recruits accepted. It reached rural districts, not easily reached by general service recruiting parties, and thus afforded opportunities for ascertaining more accurately the antecedents, character, and age of applicants, and, when properly conducted, was attended with a minimum of cost. It afforded opportunity of spreading information, and of correcting erroneous impressions concerning the duties and obligations, rights and privileges of a soldier, and attracted to the Army young men who otherwise would have been lost to it.

In an Army exceeding 10,000 men attaching batteries to regiments or brigades sacrificed the concentration which made artillery-fire formidable. Brigade
commanders could not or would not give both their regiments and batteries proper supervision. Neither did they understand artillery resupply, who was responsible for resupply or through what channels it came.

59. From 1861 to May, 1863, army commanders assigned their artillery at a ratio of 2.5 pieces per 1,000 men.

62. The Army did not eliminate the need for these details until the Act of 1912 established an enlisted branch of the quartermaster corps which enabled the assignment of a service company to each regiment.

63. In April, 1863, the Army established the Invalid Corps as an organization of men who had become physically unfit for combat. In March, 1864, this organization became the Veteran Reserve Corps, its function was to perform duty that would release men for frontline service, such as guard duty, nursing, and cooking.

65. In the years that followed, the school changed names several times, in 1907 becoming the Mounted Service School; in 1919, the Cavalry School; on 1 November, 1946, the Ground General School; and in 1950, the Army General School. The school was discontinued in May, 1955.

66. A regiment of cavalry consisted of twelve companies formed into three squadrons of four companies each. Besides the commanding officer who was a colonel, the regimental staff included seven officers, six enlisted men, a surgeon, and two assistant surgeons. Each company was authorized three officers, fifteen non-commissioned officers, and fifty-five privates. A civilian
veterinarian accompanied the regiment although he was not included in the table of organization. The 9th and 10th Cavalry were composed of Negro enlisted men and white officers. Their organization differed from the others in that each has an assigned chaplain whose duties included instructing the enlisted men in fundamental school subjects. At that time and until 1901, chaplains were normally assigned to Army posts.

67. By the act of March 3, 1898, the artillery arm was increased by two regiments, the additional organizations to be composed of twelve batteries each, two of which in each regiment to be organized, in the discretion of the President, as field artillery. These regiments were designated in orders as the Sixth and Seventh, respectively; the headquarters of the Sixth established at Port McHenry, Md., and those of the Seventh at Fort Slocum, New York; the nucleus of each battery to be formed by the detail of fifteen enlisted men obtained by transfer from existing batteries, other than those on the Pacific coast, and regulated by the proper department commanders. Under General Orders, No. 21, dated April 20, 1898, the equipment of each battery of light artillery was directed to include six guns and caissons, one combined forge and battery wagon, and one hundred horses.

CHAPTER 5

Native Filipinos were organized into companies in September, 1899. However, they were initially paid as civilian employees of the Quartermaster. On October 1, 1901, legislation authorized fifty companies. The officers were from the Regular Army except for the 1st and 2d lieutenants who an Army board selected from the most qualified natives. Congress authorized Filipino battalions in 1904. After World War I these battalions, most of which had been parts of provisional regiments during the war, were grouped into regiments and given proper designations. The regiments were the 43d, 45th, 57th, and 62d Infantry (Philippine Scouts).

The French, Austrian, and Prussian infantries both used regiments of three battalions, but the battalions were far larger. The Prussians had a thousand enlisted men in their battalions. The French had seven hundred men in theirs while the American battalions seldom had more than 426. Russian regiments in the same period had four battalions to a regiment. Each Russian battalion had one thousand men. David R. Jones, The Imperial Russian Life Guards Grenadier Regiment, 1906-1917: The Disintegration of an Elite Unit, Military Affairs, October, 1969, 33, pp. 289-302. Hubert Foster, Organization, London: Hugh Rees, Ltd., 1913, pp. 138-143.

Matloff, History, p. 351. The Dick Act accomplished the alignment of the National Guard and the Regular Army by providing federal funds. In addition, the Act prescribed drill at least once a month.
supplemented with short annual training periods. The Act also authorized detailing of regular officers to guard units and joint maneuvers. Limitations on the call-up and control of guard units severely restricted its effectiveness. Legislation in 1908 and 1914 reduced the restrictions and increased the power of the President to prescribe the length of federal service, and appoint officers of the guard when the guard was on federal service.

11. Prior to 1915, headquarters companies did not exist in any of the regiments. A small staff and an administrative detachment handled administration.

12. Legislation authorized all regiments by 1916 a colonel, a lieutenant colonel, three majors, fifteen captains, sixteen first lieutenants, and sixteen second lieutenants.

15. The National Defense Act of June 3, 1916 authorized a Regular Army of 220,000 officers and men. Congress authorized the National Guard 450,000 officers and men. The Regular Army now had authorization for twenty-five regiments of cavalry, sixty-four regiments of infantry, and twenty-one field artillery regiments.

17. United States Army in the World War, 1917-1919, Washington, D.C.: Historical Division, Department of the Army, 1948. This document gives the best
available explanation of the organization of Pershing's forces.

18. Pershing chose to organize the square divisions because the existing divisions were only on paper and the Army had not had an opportunity to test them. Army planners did not design the existing organization for a division for the trench warfare of Europe. Pershing felt that the division designed in 1916 was too large and unwieldy.

20. Army Lineage Series, Infantry, p. 43. Matloff, History, p. 374. This platoon ultimately became the cannon company of the regiment. The cannon company eventually developed into an anti-tank company and for a short time in World War II, it actually had a 105mm howitzer. It was called a howitzer company in the TO&Es of World War II.

22. Remount duty was the operation of a depot for horses where they were broken or trained for harness. Remount stations also provided an exchange service for wounded, or tired animals, for fresh mounts. The US Army received approximately 4,000 horses per month from the French. The A.E.F. used 250,000 horses from May, 1917 to November, 1918.

23. The National Army was the designation of the force raised by conscription.

24. Pioneer infantry regiments resembled infantry only in size. Pioneer infantry regiments contained 3,551 men. The unit was primarily a labor regiment used to repair bridges, repair roads, and construct fortifications. The Army organized a total of thirty-seven pioneer infantry regiments during World War II.

28. Army Lineage Series, Infantry, p. 49. G. B. McReynolds, The Field Artillery Board, The Field Artillery Journal, July, 1942, 32(No. 7), p. 505. The Field Artillery Board was the first board. It was created by the Adjutant’s Office, General Order No. 60, Washington, D.C.: HQ, Department of the Army, June 25, 1902. The fact is that in 1902 its purpose was not as a steering agency for development and proposal but, it was to advise the faculty of the School of Application for Cavalry and Field Artillery at Fort Riley, Kansas, on light field artillery matters. It was also responsible to the Commanding General of the Army through the Adjutant General for information and recommendations.

31. Army Lineage Series, Armor-Cavalry, p. 48. The impact of placing the tanks under infantry control was such that there was a great deal of theoretical but almost no tangible progress in tank production or in tank tactics in the United States Army. Production was limited to a few hand tooled test models, only thirty-five of which were built between 1920 and 1935. Regarding the use of tanks with the infantry, the official doctrine of 1939 was a repeat of the doctrine of 1922. It was stated that, "As a rule, tanks are employed to assist the advance of infantry foot troops, either preceding or accompanying the infantry assault echelon."

32. Army Lineage Series, Armor-Cavalry, p. 53. The reorganization under the 1926 National Defense Act reduced the regiments to six troops, a headquarters and headquarters troop, and a service troop.

33. Army Lineage Series, Armor-Cavalry, p. 54.

34. Army Lineage Series, Infantry, p. 49.

35. Jacobs, Soldiers, p. 26. Each regiment had two TOSMs one for peacetime and one in the event of a war.

Army Lineage Series, Infantry, pp. 53-54, 53.

Army Lineage Series, Infantry, p. 56.

Pizer, U.S. Army, pp. 35-36.

Notes for Field Artillery: Tactics, The Field Artillery Journal, November-December, 1940, 30 (No. 6), p. 436. Artillery massed late in World War I by placing the control of battalions and batteries under groups or brigades who massed the fires. The Artillery Groups and Artillery Brigades did not exist in peacetime. Initially upon organization of artillery regiments in France with French weapons division artillery and corps artillery controlled massing but, it was merely an attempt to place fires close to the target since the common grid and transfer were invented much later by Col. Surmelall.

Jacobs, Soldiers, p. 27.

Army Lineage Series, Armor-Cavalry, p. 60.

Army Lineage Series, Armor-Cavalry, p. 56.

Young, Almanac, p. 231.

Army Lineage Series, Armor-Cavalry, p. 59. Armored infantry regiments later became the mechanized infantry. However, during World War II all but two armored infantry regiments broke up to form separate armored infantry battalions during the war.

Army Lineage Series, Infantry, p. 70. The demobilization on the basis of an individual point system had no
relationship whatsoever to the size of the Army in the future. The point system was a method of assigning points for decorations, time spent in combat, time in service, and points for other variables such as marital status or wounds. The men with the highest score were discharged first regardless of grade or military occupational specialty.

58. Army Lineage Series, Infantry, p. 86.

59. Army Lineage Series, Infantry, p. 39. TO&Es entitled "Reorganization of the Airborne Division (ROTCAD)," and "Reorganization of the Current Armored Division (ROCAD)," and "Reorganization of the Current Infantry Division (ROCID)," were published on August 10, December 1, and December 20, 1956, respectively. By June, 1959, all fifteen active Regular Army divisions had been reorganized under these tables, and by June, 1959, all but one of the thirty-seven divisions in the reserve components had adopted the organizations. The ROTAD tables were superseded by the final TO&Es for Pentomic airborne units on June 31, 1958. However, the final S-series TO&Es for elements of infantry and armored divisions were not published until February 1, and May 1, 1960.

61. The combat command provided the means of exercising control over the tactical units in the armor division. The combat command also gave the armored division commander a vital link for coordinating and maneuvering his combat elements. The combat command concept made for the kind of flexibility that is necessary on a modern battlefield without sacrificing the control necessary to prevent the deterioration of combat operation into an uncoordinated mass of little fire fights. The combat command system was a result of the elimination of the brigade and an attempt to impose a tactical role on an administrative organization. The regiment simply could not handle the job with sufficient degree of flexibility.

62. In truth, the pentomic division had proven that it did not have sufficient conventional holding power and needed more men and equipment to be capable of sustained combat. It also upset the balance of officer grade requirements and was a threat to the development of the junior field grade officers because of the shortage of positions for lieutenant colonels. In 1961, the Army revised the divisional structure to provide a better balance between the mobility and the firepower of the battalion sized organization. In addition, flexibility was built into the entire division structure. Under the Reorganization Objective Army Division (ROAD) concept the Army began in 1962 to form four types of divisions. Infantry, armor, airborne, and mechanized divisions formed and each had a common base and three brigade headquarters.

63. Army Lineage Series, Infantry, p. 96.

CHAPTER 4

9. D. N. Wikmerley, The Reorganization of the Infantry, Infantry Bulletin No. 38, London: British Directorate of Infantry, September, 1945. This bulletin is quite lengthy. The important part of the bulletin is contained in Appendix A which is an address by Major General D. N. Wikmerley to the School of Infantry. It has more than 18 pages with numerous charts and statistics in an annex that is also a part of the bulletin. It contains a consolidated report and critical analysis of the problems the British have had with their system.
10. "Teeth to tail ratio" is the same as the American phrase "tooth to tail" which means the ratio of combat troops to support troops.

12. There are about 172 Regular Army regiments retained under CARS. The Army National Guard Regiments total about 225. In all 397 CARS regiments in 4 basic branches. Think of the costs involved if all regiments had separate homes. Even if all regiments are assigned to the branch centers and schools, the cost to the center and school commands just for routine mail will be staggering. Assume that all personnel are assigned to home regiments and assignments within parent regiments becomes a consideration in personnel actions. Under present Army missions and personnel systems the lack of flexibility and the malutilization of personnel and facilities that would result would produce a highly undesirable situation. If the regimental headquarters remains under Department of the Army control with some centralization it may be feasible to find a workable solution. To attempt to use civilian communities or present and former forts, posts, camps or stations would in all probability result in 300 or more regimental headquarters/homes and the need for some form of centralized command with funds. At the present time none of these proposals are financially feasible.

16. Stand-down is a mission area that is designed as a provision for individual administrative requirements such as education, special training, major preventive medical care, and time-off.

30. A contrast in operations may be found in reading the official and private accounts of the 1st Marine Division operations in the Chosin Reservoir and in the masters thesis of Robert M. Coombs, Changjin (Chosin) Reservoir, Korea, 1950: A Case Study of United States Army Tactics and Doctrine for Encircled Forces, (N-19052.186-3) Fort Leavenworth, Kansas: United States Army Command and General Staff College, 1975. The major points are the effects of the losses of key leaders, p. 61.
