20. ABSTRACT (Continue on reverse side if necessary and identify by block number) This report presents maps and schedules produced by the Air Force Refuse-Collection Scheduling Program for residential refuse collection at Fairchild Air Force Base, Washington. The data required for scheduling are discussed briefly. The computer-generated schedule reduced the number of trips from 10 to 8 and the total mileage from 272.6 to 264.4 miles.

PREFACE

This report documents work performed during the period January 1976 through April 1977 by the University of New Mexico under contract F29601-76-C-0015 with DET 1 (CEEDO) HQ ADTC, Air Force Systems Command, Tyndall Air Force Base, Florida 32403. Capt. Robert F. Olfenbuttel managed the program.

This report has been reviewed by the Information Officer and is releasable to the National Technical Information Service (NTIS). At NTIS it will be available to the general public, including foreign nations.

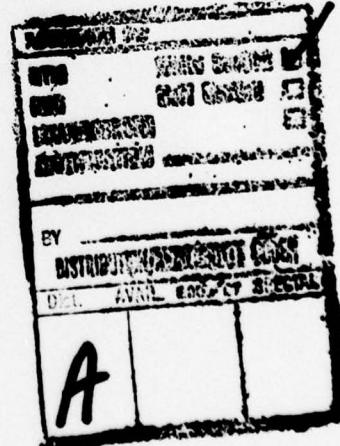

This technical report has been reviewed and is approved for publication.

## SECTION I INTRODUCTION

### BACKGROUND

From 1973 through 1975, a study was conducted at the Civil Engineering Research Facility (CERF) to evaluate the usefulness of the IBM Vehicle Scheduling Program for scheduling refuse collection at Air Force bases. This study indicated that reductions in manpower and total mileage of up to 20 percent could be obtained in some cases. The large amount of human effort required to put the routes produced by the IBM program in a useable form led to the development of the CERF Refuse-Collection Scheduling Program (RCSP). This program produces a printed schedule and maps that can be used, without modification, by the driver of the collection vehicle or in reports.

### OBJECTIVE

The objective of this report was to use RCSP to determine optimum refuse-collection schedules for four Air Force bases. These test bases provide enough variety in refuse-scheduling problems to allow a determination of the program's range of applicability and, ultimately, an evaluation of its potential for use on all Air Force bases.

### SCOPE

This report presents the results obtained when RCSP was used to schedule refuse collection at Fairchild Air Force Base, Washington. The data required for scheduling are described briefly. The original and new schedules are compared. Since the new schedule requires only eight collection trips, while the original required ten, a procedure for verifying and implementing the new schedule is given. The original and the computer-generated routes are presented on maps and as printed schedules.

## SECTION II DATA REQUIREMENTS

The data available for Fairchild Air Force Base include six maps. One map shows the area surrounding the base with the locations of Geiger Heights and Geiger Base marked. Two other maps show enlargements of on-base housing areas, while the remaining maps show enlargements of Geiger Heights and Geiger Base. The original routes within the housing areas are marked on the maps.

In addition to the maps, the following information was provided:

1. unloading time at the landfill is 15 minutes,
2. the speed limit on base is 30 miles per hour outside of housing areas and 15 miles per hour in housing areas,
3. a 10-cubic-yard vehicle services 70 houses,
4. the collection vehicle travels at 5 miles per hour in the housing areas while collecting refuse,
5. the vehicle stops for 1 minute per house, and
6. the vehicle averages 45 miles per hour between off-base housing areas and traveling to the landfill.

Ten routes were indicated on the maps. To obtain computer-generated maps and a schedule for these original routes, information describing the routes was used as input to program PHASE4. The schedule and maps thus obtained are presented in Appendixes A and B. On the first page of material in Appendix A, the sections correspond to the final trips. The section numbers on that page can be found on the route summary on the second page, in the column marked SECTION(S). Thus, section 5 is serviced by trip 1 of route 3. The section numbers are useful to the person running RCSP, but not to the vehicle drivers, so only the pages including and following the route summary would go to operational personnel.

The page of output preceding the route summary in Appendix A indicates that 196 families are serviced by the trip to section 5. This information conflicts with the information that accompanied the maps (one vehicle services only 70 houses), so the smaller number was not used. The original routes showed two trips on Cedar Street between Palm Drive and South Maple Street,

with no indication as to which trip collected the six households on that portion of Cedar Street. If these households are collected by the trip corresponding to route 3, trip 2, instead of route 3, trip 1, then the largest capacity trip services 194 households. If each of the two trip collects one side of Cedar Street, the largest capacity trip would service 193 households. Although the latter is unlikely to be the case, the vehicle capacity was set at 193 households for safety's sake.

RCSP consists of four computer programs: the data-checking program (RCINPT), the section-assignment program (PHASE2), the route-traversing program (PHASE3), and the route-map- and schedule-generating program (PHASE4).

The RCINPT data consist of six records: street names, size of output maps, and four descriptions of input maps. The third record describes the streets connecting Fairchild Air Force Base to Geiger Heights and Geiger Base, without any details of the housing areas. The actual data cards are listed in Appendix C.

Data for PHASE2 consist of only five cards: a title card, the vehicle-capacity card, the time-limits card, and two output-map size cards. These data cards are as follows:

FAIRCHILD AFB  
193.  
.5                15.                4.  
.8                2.8                10.                3.5                5.5                10.                10.  
8.                10.                10.                1.                5.                20.                10.

The required input data to PHASE3 consist of only two cards: a title card and a card giving the node numbers assigned to the landfill and the garage. Twenty-one optional cards were added, each reassigning a street segment to another section. These data cards are as follows:

FAIRCHILD AFB, WA  
1800 726  
22 6  
34 6  
35 5

51	7
52	7
56	7
75	6
57	8
43	8
62	8
61	8
49	8
66	4
64	5
102	3
113	3
116	2
117	2
137	3
139	2
188	1

Segments 34, 116, 117, and 139 were reassigned because the close approximation of street shapes had caused segments of a single street to be assigned to different collection trips. If a coarser shape approximation had been used, these streets would have been shown as single segments, and the problem would not have arisen. The reassignment eliminated the need to use two trucks to service a single street. Segments 22, 102, 113, and 188 were reassigned because they were somewhat remote from the other segments in their sections. The remaining reassessments were made to keep the loads in each trip from exceeding the vehicle capacity. Because each trip comes very close to filling a vehicle, it was often necessary to reassign several segments to remove an overflow condition caused by the reassignment of a single segment.

The three data records for PHASE4 are listed in Appendix D for the original routes and Appendix E for the RCSP routes. The first record consists of a title card, a card giving the unit of refuse measurement, two time-limits cards, and a vehicle-identification card. The third record consists of cards describing the paths in each of the routes. For the final routes, this information normally is passed from program PHASE3 to PHASE4 on disk or tape,

but since a minor change was desired in the final routes, the data were punched onto cards, modified, and included as card input to program PHASE4. The minor change involved replacing travel along Harder Place and Wortman Drive in RCSP route 4, trip 2, by an equally long but more direct route along Malstrom Drive.

### SECTION III

#### EVALUATION OF COMPUTER-GENERATED SCHEDULE

The original refuse-collection schedule for Fairchild Air Force Base required 10 trips to service all of the houses. The total mileage for the 10 trips, as estimated by PHASE4, is 272.6 miles. The computer-generated schedule requires only eight trips and covers a total distance of 264.4 miles. Thus, the computer-generated schedule decreases mileage by 3 percent and number of trips by 20 percent. The computer-generated schedule is given in Appendix F, and the corresponding maps are presented in Appendix G.

## SECTION IV IMPLEMENTATION REQUIREMENTS

RCSP assumes that any two vehicles of the same capacity could service the same number of households. Therefore, the two most important preliminary verifications are that 1) the maximum number of households serviced on one trip has been correctly determined and 2) the vehicle involved is almost always capable of completing its route without overfilling. For Fairchild Air Force Base, the heaviest collection trip is labeled ROUTE3, TRIP1 in the original route summary in Appendix A. The vehicle involved was found capable of servicing 196 households. In the routes produced by RCSP, the longest trip services 192 households, so it need only be verified that at least 192 households are serviced by what is currently the largest-capacity trip. If 196 households are actually serviced, there should be no problem with the vehicle overfilling. If none of the current trips service at least 192 households, corrected route information should be sent to the Civil and Environmental Engineering Development Office so the capacity can be determined accurately and the program rerun. If the trip described as ROUTE3, TRIP1 does service approximately 196 households, then the new schedule in Appendix F and the maps in Appendix G will be suitable for implementation.

If the scheduling is under Air Force control, the new maps and schedules can be given to the person in charge of scheduling. If a contractor is responsible for scheduling and refuse collection, the new maps and schedules may be given to him; the savings in mileage and number of trips should provide incentive for implementation. When the refuse collection contract goes out for open bidding, distribution of the computer-generated schedule may produce lower cost estimates.

APPENDIX A

ORIGINAL ROUTE SCHEDULE

SECTION	TRIP	DISTANCE (MILES)	TIME (MINUTES)	HOUSEHOLDS	CAPACITY (HOUSEHOLDS)	LOAD
