20. ABSTRACT (Continue on reverse side if necessary and identify by block number)

A computer program is developed to compute radiated and reflected sound pressures as a function of angle at a given frequency or as a function of frequency at a given angle for infinite plate structures excited by a point force or by plane acoustic waves. The plate structures have a fluid on one side, and air on the other. To compute radiated and reflected pressures, it is necessary to compute the elastic response function and several characteristic parameters of the structure. The ability to change the way in which these calculations are computed is a major factor in program design.

CONTENTS

FORTRAN Programs for Numerical and Graphical Analysis of Elastic Response, Radiated Sound Pressure, and Reflected Sound Pressure for Plane Plate Structures with Fluid on One Side

OVERVIEW

A computer program package that evaluates the theoretical formulas derived from the Timoshenko-Mindlin thick plate theory, which describe the radiated and reflected acoustic fields[1], is described. It was found that the expressions for the radiation and reflection were the same for each case analyzed, but that the elastic response function was not. The four cases implemented, whose results will be described elsewhere[2] are: a simple plane plate, a two-layer composite plate with a perfectly welded interface, a two-layer-slipping interface-composite plate, and a welded two-layer plate with a constraining layer.

Two programs are discussed in the following pages, the major portion taken up by PLTWAV, the program that does all the computation and file manipulation. Input, output, and algorithms are covered. The other program included here is TRACE, a plotting routine. This was developed so that the data from PLTWAV could be viewed on a CRT or plotter with appropriate scaling. In both cases, all the programs are in FORTRAN 4+, compatible with the Digital Electronics Corporation PDP 11/45 with the system RSX-11D or RSX-11M on the PDP 11/34.

-----

[1] Article to be published in J. Acoust. Soc. Am. by A.J. Rudgers

Note: Manuscript submitted January 18, 1979.

I. PLTWAV OUTPUT

A. GENERAL DESCRIPTION

The program PLTWAV is constructed so that numerical and/or plot output can be obtained. The file WAVDT.DAT;VERSION is created each run to provide a list of input and calculated parameters pertaining to the physical structure. This file is expanded when numerical output is desired. When plot output is desired, eight separate plot files are created in addition to WAVDT.DAT.

B. NUMERICAL OUTPUT

WAVDT.DAT

The file WAVDT.DAT is a formatted file, a new octal version of which is created each run for the purpose of listing input and computed parameters in complex form. When numerical output is desired, this file is appended to include an entire listing of calculated data in a tabulated exponential form. Each column is written using an E12.5 format which yields five (5) significant digits. The columns, which are broken and labeled every ten entries, are as follows:

THETA	The emission angle θ in degrees
FREQ	The frequency f in Hz
ROMEGA	The real part of the electric response function $Re[\Omega]$
IOMEGA	The imaginary part $Im[\Omega]$
MOMEGA	The modulus of the elastic response function Ω
AOMEGA	The angle (phase) of Ω in radians
MREF	The modulus of reflected pressure
AREF	The phase of reflected pressure in radians
MRAD	The modulus of radiated pressure
ARAD	The phase of radiated pressure in radians

ARRAY WAVDT(10)

The information written into WAVDT.DAT comes from two sources. The parameters come from the common section of the program, called PLTWAV.COM, while the calculated data come from the array WAVDT. The array is written to in the subroutine WAVDAT each time the computation loop of PLTWAV is completed. The file WAVDT.DAT has the array WAVDT written into it in the subroutine WRTFIL before the next pass through the computations.

C. PLOT OUTPUT

FILES

When plot output is desired, new octal versions of the following eight unformatted files are created:

IOMEGA.PLT;VERSION
ROMEGA.PLT;VERSION
MOMEGA.PLT;VERSION
AOMEGA.PLT;VERSION
MREF.PLT;VERSION
AREF.PLT;VERSION
MRAD.PLT;VERSION
ARAD.PLT;VERSION.

PLOT FILE CONTENTS

In each case, the plot file contains a heading followed by the data that is implied by the name of the file. The heading is written into the files by the subroutine HEADER, and includes:

IHEAD	Designates real or integer data
XINIT	The first X value
XDELT	The X increment
ITERM	= -1 to say that no further heading follows.

This heading is used by all the plot routines contained by the system used, with the exception of TRACE. Below the heading, the data is written using separate WRITE statements for X and Y. The X axis represents the parameter being searched through, either frequency F or emission angle THETA, while the Y axis takes data from the calculated value that the file name indicates.

II. PLTWAV INPUT

A. DESCRIPTION

Before the user tries to run PLTWAV, several choices need to be made, the first being whether to run interactively or automatically. In either case, the user must also decide what type of output is desired, and the range of the search to be implemented. These are the first data inputs the program needs. All the input that follows defines the physical structure to be analyzed and the information for subsequent runs. A complete run can be found in Appendix A-3.

B. INPUT DATA

The chart that follows lists all the input parameters.

Decision Parameters (=> means "implies")

REFERENCE NUMBER	NAME	UNITS	FORMAT	COMMENTS
-	IAUTO	-	I1	IAUTO designates the running mode IAUTO=1=>automatic =2=>interactive
23	IDAT	-	I1	designates output type IDAT=1=>Numerical =2=>Plot =3=>Both

REFERENCE NUMBER	NAME	UNITS	FORMAT	COMMENTS
24	ITYPE	-	I1	designates physical structure ITYPE=1=>Simple plate =2=>Composite-Welded interface =3=>Composite-Slipping interface =4=>Constrained layer problem
25	ISERCH	-	I1	designates search parameter ISERCH=1=>Emission angle THETA =2=>Frequency F

Emission Angle Search Parameters

1	THMIN	Deg.	F10.0	Minimum angle for search
2	THMAX	Deg.	F10.0	Maximum angle
3	THINC	Deg.	F10.0	Angle increment
4	F	Hz.	F10.0	Frequency

Frequency Search Parameters

5	FMIN	Hz.	F10.0	Minimum frequency for search
6	FMAX	Hz.	F10.0	Maximum frequency
7	FINC	Hz.	F10.0	Frequency increment
8	THETA	Deg.	F10.0	Emission angle θ

Fluid Parameters

9	RO	kg/m^3	F10.0	fluid density
10	C	m/s	F10.0	fluid sound speed

Plate Parameters

11	HPLAT	m	F10.0	Plate thickness
12	ROPLAT	kg/m^3	F10.2	Plate density

REFERENCE NUMBER	NAME	UNITS	FORMAT	COMMENTS
13	EPLAT	N/m^2	2F10.0	Complex Young's modulus of plate
14	GPLAT	N/m^2	2F10.0	Complex Shear modulus of plate
Coating Parameters				
15	HCOAT			same as for plate
16	ROCOAT			
17	ECOAT			
18	GCOAT			
Constrained Layer Parameters				
19	HCONL			same as above
20	ROCONL			
21	ECONL			
22	GCONL			

C. INTERACTIVE INPUT

INPUT DIALOGUE

When IAUTO=2, the input for PLTWAV becomes interactive via dialogue on the terminal. As can be seen from the parameter chart, no special formatting need be done by the user. Any value, be it integer, floating point, or exponential, will be accepted by the F10.0 format. The input sequence, which is in the same order as the data chart, can be seen in Appendix A-3.

EDIT

After the parameters have all been entered utilizing the appropriate subroutines, the routine EDIT is called. This portion of the program has a twofold function. During the first run, EDIT is used to check the input parameters; during subsequent runs, *EDIT* is used to change values to those desired next. Both of these functions are implemented in the same way. If there is a value that is incorrect, or needs to be changed for the next run, the user types the reference number to the left of the parameter name. This causes the name and present value to be displayed. The user will then type in the new value and return. At this point, the entire parameter list will be displayed again and the user will be asked if they are all correct. This sequence can be repeated until all the values are as desired, at which time, a 0 (zero) is entered to return to the main (see Appendix A-3).

END

The last I/O for the run comes at the end of all the computation, when the user is asked if another run is desired. If a '1' is entered, the program will return to EDIT, while a '0' will end PLTWAV (see Appendix A-3).

D. AUTOMATIC INPUT

PLTWAV.DAT

To run in the automatic mode, the user must have previously created the input data file PLTWAV.DAT. This file is constructed so that exactly the same input sequence is used as when running interactively (refer to the data chart). Many runs can be accomplished by use of the reference numbers (ICHANG) and the repeat variable IRPT. The sequence is as follows:

IDAT
ITYPE
ISERCH
THMIN or FMIN
THMAX or FMAX

```
THINC or FINC
F or THETA
RO
C
HPLAT
ROPLAT
EPLAT
GPLAT
HCOAT   )
ROCOAT  )  Used only when there is a coating
ECOAT   )    i.e., ITYPE = 2, 3, or 4
GCOAT   )
HCONL   )
ROCONL  )  Used only when there is a constrained layer
ECONL   )    i.e., ITYPE = 4
GCONL   )
*****
IRPT       The repeat variable
             IRPT=0=>no more runs
                 =1=>another run
ICHANGE    The parameter REFERENCE NUMBER
VALUE      New value of the parameter
ICHANGE
VALUE
  :
  :
ICHANGE=0=>return to main with all the data
IRPT
  :
  :
```

The program will end when IRPT=0; and since ICHANG=0 to return from the last data set, the last two entries in the list will be zero. For example, let PLTWAV.DAT contain the following:

Example

```
3
1
1
0
90
.25
64E3
999.7
1447.24
.05
7782.4
21.6E10,0
8.29E10,0
1
4
32E3
0
0.
```

Then to begin with, both plot and numerical data are desired, so IDAT=3. It is a simple plate so ITYPE=1, and an angle search is to be implemented so ISERCH=1. The search will start at THMIN-0° and end at THMAX=90° with an increment of THINC=.25°, and the calculations will be made at the frequency F=64 kHz. The fluid density is RO=999.7 kg/m³, and the fluid sound speed is C=1447.24 m/sec. The plate thickness is HPLAT=.05m, and it has a density of ROPLAT=7782.4 kg/m³. Young's modulus is real and has a value

E=21.6E10, while the shear modulus is G=8.29E10. A repeat run is desired, so IRPT=1. The reference number 4 is for frequency, so the new frequency is F=32 kHz. There are no further changes, so ICHANG=0, and no more runs so IRPT=0 (see Appendix A-3).

III. TRACE

A. OVERALL

The program TRACE and its associated subroutines form a plotting package for use with the Textronix 4662 Interactive Plotter. Implemented to accept up to five different plot files and plot them with different line types, this package also allows for absolute scaling (linear only) and absolute size control (up to 10 x 15 inches). There is an option that will draw a legend on either side of the plot, but no labeling is performed.

B. OUTPUT

The plot output from TRACE includes five different line types. The curves are traced by means of alternating arcs of light and dark, the arc length being specified by the array DASH in the subroutine SETDSH. Specifications for setting DASH can be found in the subroutine TKDASH (see Appendix B-4).

A legend can also be plotted by TRACE by the use of the subroutine LABEL. The legend can appear on either side of the plot, and at any distance from the top.

C. INPUT

The input for TRACE is interactive via dialogue on the terminal. The user is asked how many curves are to be drawn, what the file specifications are, the scale limits, the label (legend) options, and to check the paper alignment.

LINE TYPE DESIGNATION

The plotter package can handle as many as five different files from any of the memory devices. The user types a number (1-5) when asked, and then types in the entire file specification for each curve. If a particular line type is not desired, a zero (0) is entered as the file specification. For example, if a solid line is not wanted, a zero is entered as the first file name.

SCALING

The user inputs minimum and maximum values for both axes. The scaling is computed on the basis of a 682 x 1023 grid. The entire grid can be as large at 10 x 15 inches and the axis limits can be of any value.

PAPER ALIGNMENT

When the user is asked to align the paper, he is told to enter an ordered pair. This ordered pair should be in terms of the scale, not the grid. Checking the corners seems to be sufficient.

LEGEND

The user is asked to specify the placement of the legend by right or left side, (0 means no legend), and placement below the normal position. The first is accomplished by typing R, L, or 0, while the latter is by typing an integer (0-585). The legend is normally 14 grid units down and 30 grid units inside the limits of the plot.

IV. ALGORITHM DEVELOPMENT

A. EQUATIONS

Begin by noting that what is wanted are radiation and reflection, which are governed by the following:

Pressure radiated:

$$P_{rad} = \cos\theta/[1 + j\Omega\cos\theta],$$

Pressure reflected:

$$P_{ref} = 1\text{-}2/[1 + j\Omega\cos\theta]$$

where there is a different structural response for each physical structure. For a simple plate, the elastic response function Ω is:

$$\Omega = (k_o/\omega^2\rho)\left\{h\rho_s\omega^2 - gh\tilde{k}^2 + \tilde{k}^2(gh)^2/[D\tilde{k}^2 + gh - \rho_s h^3\omega^2/12]\right\}.$$

For a composite plate with welded interface, the elastic response function is:

$$\Omega = (k_o/\omega^2\rho)\left\{\omega^2(h\rho_s + h'\rho'_s) - \tilde{k}^2(g'h' + gh) + \tilde{k}^2h^2[g^2 - (g')^2]/[\tilde{k}^2(D - \beta^2D') + h(g - \beta g') - (\beta\rho_s - \rho_s')\omega^2h^2h'/12]\right\}.$$

For a composite structure with slipping interface:

$$\Omega = (k_o/\omega^2\rho)\left\{\omega^2(h\rho_s + h'\rho'_s) - \tilde{k}^2(gh + g'h') + \tilde{k}^2(gh)^2/[\tilde{k}^2D + gh - \omega^2\rho_s h^3/12] + \tilde{k}^2(g'h')^2/[\tilde{k}^2D' + g'h' - \omega^2\rho_s'h'^3/12]\right\}.$$

For a constrained layer, the result is:

$$\Omega = (k_o/\omega^2\rho)\Big\{\omega^2(h\rho_s + h'\rho'_s + h''\rho''_s) - \tilde{k}^2(gh + g'h')$$

$$+ \tilde{k}^2h^2[g^2 - (g')^2]/[\tilde{k}^2\{D - \beta^2D' + (h/h'')D''\}$$

$$+ h(g - \beta g') - (\beta\rho_s - \rho_s')\omega^2h^2h'/12]\Big\}.$$

To do these computations, several secondary parameters are needed:

$$\kappa = (0.87 + 1.12\nu)/(1 + \nu)$$

$$g = \kappa^2G$$

$$D = Eh^3/[12(1 - \nu^2)]$$

$$\omega^2 = (2\pi f)^2$$

$$\beta = h/h'$$

$$k_o = 2\pi f/c$$

$$\tilde{k} = k_o\sin\theta$$

B. NAME LIST

A name list is required to keep track of the parameters.

Program Name	Generic Name
THETA	θ
THMIN	θmin
THMAX	θmax
THINC	θincrement
F	frequency
FMIN	fmin
FMAX	fmax
FINC	fincrement

Program Name	Generic Name
PI	π
F2	ω^2 (= angular frequency)^2
CX1	1
CX2	2
CXJ	$j = \sqrt{-1}$
C	fluid sound speed c
RO	fluid density ρ
ROPLAT	ρ_s - density of plate
ROCOAT	ρ_s' - coat density
ROCONL	ρ_s'' - constrained layer density
H	h - thickness (general)
HPLAT	h - thickness of plate
HCOAT	h' - coat thickness
HCONL	h" - constrained layer thickness
G	G - shear modulus (general)
GPLAT	G - shear modulus of plate
GCOAT	G' - shear modulus of coat
GCONL	G" - shear modulus of constrained layer
SG	$\kappa^2 G$ modified shear (general)
GP	g - modified shear of plate
GC	g' - modified shear of coat
GL	g" - modified shear of constrained layer
E	E - Young's Modulus (general)
EPLAT	E - Young's Modulus of plate
ECOAT	E' - Young's Modulus of coat
ECONL	E" - Young's Modulus of constrained layer
BETA	β
KO	k_o
K	k
KAPA	κ - (general)

Program Name	Generic Name
KAPAPL	κ - of plate
KAPACO	κ' - of coat
KAPACL	κ'' - of constrained layer
D	D (general) flexural rigidity
DPLAT	D - of plate
DCOAT	D' - of coat
DCONL	D" - of constrained layer
V	ν - (general) Poisson's ratio
VPLAT	ν - of plate
VCOAT	ν' - of coat
VCONL	ν'' - of constrained layer
RAD	P_{rad}
REF	P_{ref}
OMEGA	Ω - elastic response function

C. FORTRAN VERSIONS

With these names, the FORTRAN versions become (in general):

```
RAD = COS(THETA)/[CX1 + CXJ * OMEGA * COS(THETA)]
REF = CX1 - CX2/[CX1 + CXJ * OMEGA * COS(THETA)]
V = [E/(CX2 * G)]  - 1
KAPA = (.87 + 1.12V)/(1 + V)
SG = (KAPA) ** 2 * G
D = E * (H ** 3)/[12 * (1 - V ** 2)]
F2 = (2 * PI * F) ** 2
KO = 2 * PI * F/C
K = KO * SIN(THETA)
```

Wherever possible, constants that need to be complex are specified, such as CMPLX(12.,0.). Each OMEGA is computed in a separate subroutine. The simple plate Ω is computed in OMEGA1, composite with welded interface in OMEGA2, and so on (see Appendix A-7).

RUNNING PLTWAV
- INTERACTIVE -

```
MCR>RUN PLTWAV )

HOW DO YOU WISH TO RUN?

1 AUTOMATICALLY
2 INTERACTIVELY

 TYPE 1 OR 2    2 )

WHAT TYPE OF DATA OUTPUT WOULD YOU LIKE?

 1   NUMERICAL DATA FILES
 2   PLOT FILES
 3   BOTH

 TYPE 1,2, OR 3    2 )

WHAT TYPE OF STRUCTURE DO YOU WANT TO ANALYZE?

 1 SIMPLE PLATE
 2 COMPOSITE WITH WELDED INTERFACE
 3 COMPOSITE WITH SLIPPING INTERFACE
 4 CONSTRAINED LAYER-WELDED INTERFACE

TYPE 1, 2, 3,OR 4    4 )

WHAT TYPE OF SEARCH?

 1 THROUGH EMISSION ANGLE
 2 THROUGH FREQUENCY

TYPE 1 OR 2    1 )
```

Note: 1), All underlined portions are User supplied
2),) means 'RETURN'

```
SOME INFORMATION IS NEEDED.

THE PARAMETERS CAN BE INPUT USING ANY FORMAT.
THE COMPLEX PARAMETERS CAN BE SEPERATED INTO
REAL AND IMAGINARY PARTS BY A COMMA.

PLTWAV COMPILATION

THE COMPILER FOR FORTRAN 4 PLUS ON THE PDP 11/45 WITH THE RSX 11-D SYSTEM IS RUN USING THE 'F4P' COMMAND. THIS OPERATION TAKES THE SOURCE FILE AND CREATES AN OBJECT CODE IMAGE WITH THE SAME NAME. WHAT FOLLOWS IS A FILE CALLED 'PLTWAV.F4P', AND IS THE COMMAND FILE FOR COMPILING ALL OF THE ROUTINES USED BY 'PLTWAV'. TO INDICATE THIS FILE TO THE COMPILER, USE THE COMMAND STRING: '@PLTWAV.F4P' AFTER THE 'F4P' COMMAND HAS CALLED THE COMPILER. FOR EXAMPLE:

```
CONTROL C ⤸
MCR>F4P ⤸
F4P>@PLTWAV.F4P ⤸
F4P>CONTROL Z ⤸TO EXIT
```

```
PLTWAV=PLTWAV/-SP/-RO/TR/CK
TKCLER=TKCLER/-RO/-SP/TR/CK
READ=READ/-RO/-SP/CK/TR
FDAT=FDAT/-RO/-SP/TR/CK
THDAT=THDAT/-RO/-SP/TR/CK
EDIT=EDIT/-RO/-SP/TR/CK
READPL=READPL/-RO/-SP/TR/CK
READCO=READCO/-RO/-SP/TR/CK
READCL=READCL/-RO/-SP/TR/CK
COMP=COMP/-RO/-SP/TR/CK
WAVPLT=WAVPLT/-RO/-SP/TR/CK
HEADER=HEADER/-RO/-SP/TR/CK
OPNFIL=OPNFIL/-RO/-SP/TR/CK
WAVDAT=WAVDAT/-RO/-SP/TR/CK
WRTFIL=WRTFIL/-RO/-SP/TR/CK
OMEGA1=OMEGA1/-RO/-SP/TR/CK
OMEGA2=OMEGA2/-RO/-SP/TR/CK
OMEGA3=OMEGA3/-RO/-SP/TR/CK
OMEGA4=OMEGA4/-RO/-SP/CK/TR
```

2), ⤸ means 'RETURN'

A-5

PLTWAV TASK BUILDING

THE TASK BUILDING OPERATION ON THE RSX 11-D SYSTEM IS USED TO LINK THE OBJECT FILES THAT HAVE BEEN CREATED BY THE COMPILER. THIS ALLOWS THE USER TO OVERLAY THE ROUTINES AS OPPOSED TO THE MORE USUAL BATCH PROCESSING, INCREASING THE SPEED OF THE PROGRAM AND REDUCING ITS MEMORY REQUIREMENTS. WHAT FOLLOWS IS 1) THE COMMAND STRING FOR THE TKB OPPERATION AND 2) THE COMMAND FILE 'PLTWAV.TKB' THAT THE STRING DIRECTS THE TASK BUILDER TO.

```
CONTROL C )
MCR>TKB )
TKB>@PLTWAV.TKB )
TKB>CONTROL Z )TO EXIT

C
      REAL K,KO
```

PLTWAV LISTING

```
C  WRITTEN BY MARTIN D. RING AT THE NRL-USRD.  AUG. 22,1978
C  THIS IS THE MAIN PROGRAM PLTWAV.FTN
C
C THE SUBROUTINES CALLED ARE LISTED HERE:
C
C       READ FOR I/O WHEN THE AUTOMATIC OPTION IS USED
C
C       TKCLER CLEARS THE CRT SCREEN
C
C       FDAT  TAKES INPUT DATA WHEN FREQUENCY IS AN INDEPENDENT
C             VARIABLE
C
C       THDAT WHEN THETA--THE ANGLE OF EMISSION--IS AN IND. VARIABLE
C
C       READCO  INPUT DATA PERTAINING TO THE COATING
C
C       READPL  INPUT DATA PERTAINING TO THE PLATE
C
C       READCL  INPUT DATA PERTAINING TO THE CONSTRAINED LAYER
C
C       EDIT TO CHECK THE INPUT SEQUENCE
C
C       COMP  TO COMPUTE MATERIAL PARAMETERS
C
C       WAVPLT TO OPEN THE PLOT FILES USING HEADER
C
C       OPNFIL TO OPEN THE DATA AND PLOT FILES
C
C       OMEGA1 TO COMPUTE OMEGA FOR SIMPLE PLATE PROBLEMS
C
C       OMEGA2 TO COMPUTE OMEGA FOR WELDED INTERFACE
C
C       OMEGA3 TO COMPUTE OMEGA FOR SLIPPING INTERFACE
C
C       OMEGA4 TO COMPUTE OMEGA FOR CONSTRAINED LAYER
C
C       WAVDAT TO FILL AN ARRAY-WAVDT(10)
C
C       WRTFIL TO WRITE PARTS OF WAVDT INTO FILES
C
C  A LIST OF PARAMETERS AND THEIR NAMES FOLLOWS:
C
C   FREQUENCY. . . . . . . . . . . . . . . . . . . . .F HERTZ
C   FLUID SOUND SPEED. . . . . . . . . . . . . . . . .C METERS/SEC
C   SHEAR MODULUS OF PLATE . . . . . . . . . . . . . .GPLAT NT/SQ METER
C                    COATING . . . . . . . . . . . . .GCOAT
C                    CONSTRAINED LAYER . . . . . . . .GCONL
C   MODIFIED SHEAR MODULUS OF PLATE. . . . . . . . . .GP
C                             COATING. . . . . . . . .GC
C                             CONS. LAYER. . . . . . .GL
C   DENSITY OF FLUID . . . . . . . . . . . . . . . . .RO KG/METER CUBED
C              PLATE . . . . . . . . . . . . . . . . .ROPLAT
C              COATING . . . . . . . . . . . . . . . .ROCOAT
C              CONSTRAINED LAYER . . . . . . . . . . .ROCONL
C   THICKNESS OF PLATE . . . . . . . . . . . . . . . .HPLAT METERS
