PREFACE

An investigation of the energy usage and the costs associated therewith by various heating devices was conducted by Food Engineering Laboratory, US Army Natick Research and Development Command (NARADCOM) in 1977. The effects on organoleptic factors, color, odor, flavor, texture and appearance, were not considered in that study. A logical follow-on study with eleven meat entrees evaluated the effect of two rates of freezing and five methods of rethermalization on the organoleptic factors cited above. Products were packaged in half-size, rigid foil, steam table pans for rethermalization in a steam cooker, convection oven and standard oven, and in boil-in-the-bag pouches for rethermalization in the microwave oven and in boiling water. A technological panel evaluated the products.

The authors wish to thank Mr. Milton Swanson and Dr. S. E. Wallen for conducting some of the technological evaluations of the meat entrees.

EFFECT OF FREEZING RATE AND METHOD OF RETHERMALIZATION ON THE ORGANOLEPTIC QUALITIES OF ELEVEN MEAT ENTREES

INTRODUCTION

Swift et al studied the efficiency and cost factors involved in rethermalizing frozen food to serving temperature (71°C).¹ Various heating devices (standard and convection ovens and high- and lowpressure steam cookers) were evaluated. Their work did not cover the organoleptic aspects of rethermalized foods. The work reported herein, therefore, is a logical extension of the work reported by Swift and his colleagues.

The boil-in-the-bag concept of heating foods is not new. Food items are commonly found in the supermarket that are heated to serving temperature by merely immersing the sealed bag in boiling water for 15 to 20 minutes.

The advantages of boil-in-the-bag on the civilian market are convenience and labor savings. They are generally priced slightly higher than their plainly packaged counterparts. In large size units, i.e., five pounds, the economic factor of cost of the package is introduced. A 26-cm by 20-cm by 6.5-cm rigid foi 1, half-size steam table pan with lid costs about thirty cents per unit at current prices. The cost of a bag constructed of a single laminate nylon has been estimated at nine cents per bag currently.

¹Swift, J., S. Conca and J.M. Tuomy. Efficiency and cost factors in rethermalizing frozen food in typical dining hall equipment. Natick/TR-78/014. (1978).

In addition to the economic factors, some other advantages

seen for the boil-in-the-bag method of handling foods are: (a) reduction in freezer burn by minimizing contact of the product with air. Foil pans can have the entire surface of the product (520 cm²) exposed to the head space atmosphere; (b) reduction of the surface browning or crusting during reheating which reduces usable yield; (c) reduction of loss of volatile nutrients through escaping steam; and (d) simpler, more foolproof preparation in the dining hall. There is the future possibility of immersion-freezing of the bags which is not feasible with the foil Therefore, if a large proportion of the frozen entrees proposed pan. for production at a facility such as the Central Food Preparation Facility at Fort Lee, VA could be packaged in boil-in-the-bag pouches, a considerable savings in packaging material and costs could be realized. Some improvement in product quality might also result. The savings in required storage freezers could also be substantial.

This report is concerned with the results of an evaluation of eleven meat entrees packed in either boil-in-the-bag pouches or foil pans; frozen at two rates, and rethermalized in one of five ways; i.e., boiling water, steam cooker, microwave oven, convection oven, and standard oven.

MATERIALS AND METHODS

<u>Materials</u>. Nine of the entrees were prepared by following the production guides found in Technical Report TR 74-27 FEL.² Chicken Cacciatore and Roast Beef were prepared using other recipes. The eleven entrees prepared for this study were:

- a. Creamed Ground Beef
- b. Chili Macaroni
- c. Barbecued Beef Cubes
- d. Beef Stew
- e. Swiss Steak with Tomato Sauce
- f. Roast Beef
- g. Chicken Cacciatore
- h. Oven Fried Chicken
- i. Turkey a la King
- j. Pork Chop Suey
- k. Baked Tuna and Noodles

For convenience, these production guides and the recipes for Chicken Cacciatore and Roast Beef are reproduced herein and are contained in Tables Al to All, in the Appendix.

<u>Preparation and Packaging</u>. Each product was prepared in sufficient quantity to provide enough material for 16 five-pound containers. Six of the containers were 26-cm by 20-cm by 6.5-cm rigid

²Helmer, R.L. and H.T. Schlup. Meat entree item production guides developed for use in Ft. Lee interim central food preparation facility. TR 74-27 FEL (FEL-12) March 1975.

foil half-size steam table pans. The aluminum lids were mechanically crimped onto the pans to insure a tight seal. Ten bags constructed from a single laminate nylon film tube were prepared. Each bag was sealed once on the bottom and twice on the top. The purpose for the double seal on the top closure was to account for any product or wrinkles in the seal area. Four of the bags were used for the test. Two bags had thermocouples sealed in them and were connected to a recorder to indicate when the proper temperature for the product was reached. Four bags were used as reserve product in case of breakage or other mishap.

<u>Freezing</u>. Three aluminum pans and five bags of each product were frozen in a conventional freezer operating at -10° C. An equal number of containers were frozen in a blast freezer operating at -29° C. After freezing, all product was stored at -10° C until tested.

<u>Rethermalization</u>. Five methods of rethermalization were evaluated. In each instance, product was rethermalized to an internal temperature of 71° C except roast beef which was rethermalized to an internal temperature of 63° C. Residence times in the various heating devices were adjusted so that product did not remain on the heated serving unit for an excessive time before serving.

a. <u>Standard oven</u>. A Vulcan gas range, Model 17845A, Style 9-66^a was used for the convection oven. Heating times ranged from 1.5 to 2 hours.

7

^aVulcan-Hart Corporation, Baltimore, MD

b. <u>Convection oven</u>. A Blodget oven, Type RE-43^b was used for the convection oven. Heating times ranged from 1.25 to 1.5 hours.

c. <u>Steamer</u>. A Flexseal Speed cooker^C was used to rethermalize product by steam. Approximately one hour was required for heating at 103 kPa.

d. <u>Microwave oven</u>. A Litton Menumaster^d microwave oven was employed for this heating test. Approximately 30 minutes was required to heat samples in the microwave oven. Product packed in bags was used in the microwave oven.

e. <u>Steam kettle</u>. A 40-gallon, 1/2 steam jacketed kettle^e was used to heat the boil-in-the-bag samples. The bags were placed in a wire basket to keep them from floating and to facilitate removal from the water. One hour was the average time to heat product to an internal temperature of 71° C.

<u>Evaluation</u>. Each product was evaluated by a panel of trained food technologists. Products were evaluated for color, odor, flavor, texture, and appearance on a 9-point scale where 9 is excellent, 5 is fair, and 1 is extremely poor.

Analysis of data. The averages of the panel scores were analyzed for significant differences by a standard analysis of variance method.

RESULTS AND DISCUSSION

Examination of the averages of the panel scores presented in Table 1 indicates that the freezing rate and the method of rethermalization had only minor effects on the color of the products. The Analysis of Variance (ANOVA) of the color data confirms this conclusion (Table 2). Some differences were noted by the technologists preparing the products for panel testing. The products rethermalized in foil pans tended to brown at the edges of the pan with a slight oil separation in some of the items. The microwave rethermalized products tended to form brown streaks. These differences were discounted by the panelists or not observed in the individual portions evaluated by the panel.

The average panel scores for odor of the entrees are shown in Table 3. Examination of the scores for Oven Fried Chicken revealed that when the product was frozen in the blast freezer, the odor of the Oven Fried Chicken rethermalized in the convection oven was very slightly preferred over the odor of chicken rethermalized by the four other methods. This was not observed when the Oven Fried Chicken was frozen in the standard freezer. With both methods of freezing, Oven Fried Chicken rethermalized in the standard oven rated lower than chicken rethermalized by the other methods.

Table 4 presents the results of the ANOVA for the ratings of the odor of the eleven entrees. Only the odor of Oven Fried Chicken was significantly affected ($p \ge 0.05$) by the method of rethermalization. No other significant differences were revealed by the ANOVA.

Examination of the panel data for Creamed Ground Beef (Table 5) shows that the product rethermalized in the standard oven was the least preferred. However, the panel gave the product a satisfactory rating. It is likely that a consumers' panel would not detect any differences that could be attributed to the method of rethermalization.

The flavor scores of Roast Beef frozen in the standard freezer was preferred when the item was rethermalized in the boil-in-the-bag pouch or in the convection oven over Roast Beef rethermalized by the other three methods (Table 3). Roast Beef frozen in the blast freezer and rethermalized in the convection oven was preferred over product rethermalized by the other methods (Table 5).

Table 6 shows the results of the ANOVA of the flavor scores of the eleven meat entrees. The method of rethermalization significantly affected the scores for Creamed Ground Beef (p > 0.01) and Roast Beef (p > 0.05).

The method of freezing had no significant effect on the flavor of any of the entrees.

An interaction was noted between the freezing rate and method of rethermalization for Creamed Ground Beef (p > 0.01) and for Baked Tuna and Noodles (p > 0.05). It is probably that the interactions are the result of a synergistic effect in that one or neither of the variables studied have a significant effect but together the effect becomes statistically significant.

The data in Table 7 show that Beef Stew frozen in the standard freezer and rethermalized in the steam cooker or the microwave oven had a texture that was preferred over the texture of the Beef Stew rethermalized in the boil-in-the-bag pouch, the convection oven, or the standard oven. The rate of freezing and the method of rethermalization did not affect the texture of the other entrees significantly.

The freezing rate had a significant effect $(p \gg 0.05)$ on the texture of Beef Stew (Table 8). The data in Table 9 show that for Beef Stew product frozen in the blast freezer and rethermalized in the microwave oven had an appearance that less preferred than Beef Stew rethermalized by the other methods. When Beef Stew was frozen in the standard freezer product rethermalized in the convection oven and in the standard oven received lower scores for appearance than Beef Stew rethermalized by the other methods.

Roast Beef rethermalized in the steam cooker was rated lower by the panel than when rethermalized by the other four methods. Roast Beef frozen in the standard freezer and rethermalized in the boil-in-thebag pouch received a higher average panel score than for the other methods of rethermalization.

Examination of the data in Table 9 shows that Baked Tuna and Noodles frozen in the standard freezer and rethermalized in the steam cooker was preferred less than product rethermalized in the other heating devices. When Baked Tuna and Noodles were frozen in the blast freezer, the product rethermalized in the convection oven rated lower than product rethermalized by the other methods. The highly significant

interaction (p > 0.01) is probably the result of a synergism between the two variables.

Average panel scores (Table 9) show that fast freezing was very slightly preferred to slow freezing. The average panel ratings indicated the product had an acceptable appearance.

The ANOVA (Table 10) for the effect of freezing rate and method of rethermalization on the appearance of the entrees shows that the method of rethermalization significantly affected (p 0.05) the appearance of Beef Stew, Roast Beef, and Baked Tuna and Noodles.

The data in Table 10 shows that the freezing rate significantly affected the appearance of Turkey a la King.

All of the entrees evaluated in this study were acceptable to a technological panel regardless of the freezing rate or the method of rethermalization. Over ninety-seven percent of the average panel scores were 6.0 and above, and over twenty-one percent were 7.0 and above.

CONCLUSIONS

1. The entrees studied in this work can be frozen and rethermalized by the boil-in-the-bag method described herein without serious adverse effect on the acceptability of the products.

2. The rate of freezing has little or no effect on the organoleptic qualities of the entrees.

RECOMMENDATIONS

1. The boil-in-the-bag method should be evaluated in a production situation such as at a Central Food Preparation Facility.

2. The ease of preparation of the boil-in-the-bag should be evaluated against the standard half-size foil pan in a dining hall feeding situation.

This document reports research undertaken at the US Army Natick Research and Development Command and has been assigned No. Natick/ TR-78/024 in the series of reports approved for publication. Table 1. Average panel ratings of the color of eleven meat entrees

APPENDIX

PRODUCTION GUIDES

Table Al. Production Guide for Creamed Ground Beef

L-30

Yield: 100 portions

Each portion: 1 cup (240 ml)

Ingredients	Percentage	Pounds	Grams	Procedure
Beef boneless, ground	30.04	24.00	10896	<pre>l. In a steam kettle of suitable size, brown the ground beef (mixer on slow speed). After browning, drain and discard liquid.</pre>
Celery, ground Pepper, black Soup & gravy base (beef Onion, dehydrated, (chopped)	0.01 0.04) 2.06 1.26	0.01 0.03 1.65 1.01	5 14 749 459	2. Add ground celery, pepper, soup and gravy base, and onions to beef. Mix thoroughly.
Starch, Col-Flo 67 Flour, wheat, pastry Water	2.12 2.35 54.18	1.70 1.88 43.28	772 854 19649	3. While meat is browning, blend starch and flour into half the required water to make a slurry 4. Turn off steam. With mixer on slow speed, pour in slurry. After thorough blending, heat to thicken. (Cook for 20 minutes at 190°F (88°C).
Milk, Nonfat, dry	7.94	6.35	2883	 5. Mix milk with remaining water to rehydrate milk. With heat off and mixer on slow speed blend in milk. Heat to 170°F (77°C) being careful not to scorch. Bring volume to 6.25 gallons (23.28). 6. Weigh 5 lb (2270 g) product into half-size steam table pans or boil-in-the-bag pouches. 7. Cover or seal, label, and freeze.

NOTES: Volume = 6.25 gallons (23.21) 100 portions l Cup = 10 oz (284 g) by wt.

Table A2. Production Guide for Chili Macaroni
