PREFACE

The Automation and Computer Technology Dictionary is the fifth in a series of Chinese-English technical dictionaries. The purpose of the series is to provide rapid reference tools for translators, abstractors, and research analysts concerned with scientific and technical materials from Mainland China. This dictionary will be published in two volumes, containing about 40,000 terms selected from the latest edition of the English-Chinese Glossary of Computer Technology (YING-HAN-JI-SUAN-JI-SHU-CI-HUI (STC 5391/3352/6060/4615/2111/5890/6101/0565)), Peking, 1977; and the English-Chinese Glossary of Automation and Detection Instruments (YING-HAN-ZI-DONG-XUE-JI-JIAN-CE-YI-BIAO-CI-HUI (STC 5391/3352/5261/0520/1331/0644/2914/3261/0308/5903/6101/0565)), Peking, 1974.

The terms included relate not only to overall design of computer systems, logic design, computer-aided design, storage, data processing, software, machine translation, automation design, automatic control, servosystems, kinematics, remote control, analog machines, simulators, engineering cybernetics, detection instruments, etc., but also incorporate vocabulary from the basic sciences and the auxiliary technologies closely associated with automation and computer science, such as microelectronics, integrated circuit, semiconductors, computational mathematics, chemistry, etc.

The special features of this dictionary include an abridged STC index in each volume covering the terms presented in that volume; conformity with Mainland China practice in regard to (1) terminology, (2) style of the Chinese characters, and (3) complete alphabetical look-up by means of the "pinyin" spelling. Characters in some of the terms have been regrouped for optimum charity and suitability for computer processing.

Following this preface is an errata sheet correcting and updating previously published dictionaries.

ARRANGEMENT OF CHINESE ENTRIES

The Chinese written language is undergoing an evolution toward simpler forms, i.e., individual characters with reduced numbers of strokes. This process is in effect eroding the traditional classification of a character by its radical with a fixed number and the residual stroke count. As a result Chinese-English dictionaries published in Mainland China and elsewhere are resorting to a system of alphabetic lookup. The basis of this system is the "pinyin" spelling of Modern Standard Chinese as established in Mainland China. In the "pinyin" system, it is a practice that when 的 is used as a possessive particle it is romanized as "d", such as xuanzed (选择的), xuanzhuand (旋转的), etc.; whereas 的 is used other than a particle, it is romanized as "di", such as mudi (目的), zidong xundi (自动寻的), etc. With a standardized spelling, a Chinese dictionary now resembles more nearly one of an alphabetic language.

In the dictionaries of this series, the Chinese entries are ordered in accordance with the transcription of the first character of the term. Homophones are arranged in order by syllable, tones 1 to 4, total stroke count, radical, and residual strokes. Succeeding syllables of an entry are in alphabetic order and where homophones in second place occur the one with the lower stroke count precedes.

A character index is provided for users less familiar with the pinyin spelling. It is a "total stroke" index with a visual radical column, the purpose of which is to eliminate tedious and time-consuming radical identification and subsequent counting of residual strokes before locating the desired character. A character located in the INDEX refers the reader to the page where terms beginning with this character are listed.

It is confidently expected that the presentation of Chinese technical terminology in an alphabetic lookup system will reduce access time for Chinese dictionaries to that of any other alphabetic language.
