#### 18. SUPPLEMENTARY NOTES

The findings in this report are not to be construed as an official Department of the Army position unless so designated by other authorized documents.

#### 19. KEY WORDS (Continue on reverse side if necessary and identify by block number)

Clinical Investigations, all medical specialties

Investigational protocols

Publications, Presentations (at national, international, and regional science meetings)

Detail Summary Sheets to include status and key words. (cont. on reverse side)

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) Subject report identifies the research activities conducted by Brooke Army Medical Center investigators through protocols approved by the Clinical Investigation Committee, the Human Use Committee, and the Laboratory Animal Use Committee and registered with the Department of Clinical Investigations during Fiscal Year 1981. Report also includes known presentations and publications by the Brooke Army Medical Center staff. The research protocols described were conducted under the provisions of AR 40-38, as amended, Clinical (continued on reverse side)

#### Block 20. Abstract

Investigation Program; AR 40-7, Use of Investigational Drugs in Humans; USAMRDC 70-25, Use of Volunteers as Subjects of Research; HSC Reg 40-23, Management of Clinical Investigation Protocols and Reports; and BAMC Memo 40-98, Department of Clinical Investigation, to insure the medical well-being, preservation of rights and dignity of human subjects who participated in these investigational studies. Research studies involving the use of laboratory animals were conducted under the provisions of AR 70-18, Laboratory Animals, Procurement, Transportation, Use, Care, and Public Affairs.

#### FOREWORD

"When  $\underline{I}$  use a word," Humpty Dumpty said, in rather a scornful tone, "it means just what I choose it to mean - neither more nor less."

"The question is," said Alice, "Whether you can make words mean so many different things."

"The question is," said Humpty Dumpty, "Which is to be master - that's all." (Carroll, L. Through the Looking Glass, 1871)

Although we are confronted at times with "distinctions" (meaning "whose budget?") between clinical investigation and medical research, it is of more importance to clearly define the <u>lack</u> of difference between high quality patient care and active clinical investigation. Despite recognition of this concept by medical organizations and hospital accreditation groups (eg., JCAH), the general public and the bureaucracy controlling the purse strings often perceives research as unnecessary, a diversion of time from patient care, and an acceptable area from which to trim the budget. It is easy looking backwards to justify the time and money spent by clinical investigators such as Walter Reed, Roger Brooke, and William Beaumont. Their medical research produced the best patient care, not only for the subjects of their investigations, but for society as a whole. It is more difficult to look forward.

"The political ambience of our time compels the scientific community to seek firm grounds for receiving a share of public resources. It might be far more realistic, however, as well as useful, for all parties to agree that, after all, we really can't measure these things with any precision and that the most difficult segment to measure, basic research, isn't so expensive that we can't afford to run on the principle that it should be kept reasonably plump." (Greenberg, D.S. Washington report. N. Engl. J. Med. 301:1456, 1979)

It thus becomes our responsibility to become master of the words "clinical investigation" and to assure their meaning is clearly understood as being synonymous with continuous improvement in the quality of patient care. Clinicians must assume active roles in formulating policies regulating research and educating those in control of financial resources as well as the general public. Often the public's perception of benefit to the patient and society overshadows the scientific merit or medical importance of any clinical investigation. With the current emphasis on patients assuming greater responsibility for decisions regarding their health care, it is imperative that the positive contributions of medical research to improved quality of care be made clear to patients and society.

BAMC has been fortunate in having a command leadership that is outstanding in its support of clinical investigations. There has been a growth in the number of active protocols (as well as their quality), the number of publications and presentations, the Department of Clinical Investigation staff available to support research, and facilities, especially the new Laboratory Animal Research and Training Center. The real credit for the work presented in this volume belongs to the clinical investigators (from principal investigators to laboratory technicians) who have devoted their time and talents to increasing medical knowledge and quality of care. Equally important are the patient volunteers who freely consented, sometimes without direct benefit to themselves, to participate in gathering new knowledge and providing a base for improved patient care.

#### UNIT SUMMARY - FISCAL YEAR 1981

#### A. Objectives

The objectives of the Department of Clinical Investigation are as follows:

- 1. To achieve continuous improvement in the quality of patient care.
- 2. To assist in the professional growth and development of the house staff by providing guidance and support in clinical research.
- 3. To provide a milieu conducive to retention of competent staff personnel and recruitment of new personnel.
- 4. To provide a review body for research proposals by investigators currently assigned to MEDDAC Units in an effort to promote an interest in Army medicine and retention in the Army Medical Corps.
- 5. To maintain an atmosphere of inquiry consistent with the dynamic nature of the health sciences.
- 6. To maintain a high professional standard and accreditation of advanced health programs.
- 7. To assure the highest level of professional standards in the conduct of human research.

#### B. Technical Approach

All research, investigational, and training activities within the Department of Clinical Investigation are conducted under the guidance of AR 40-7, AR 40-38, AR 70-25, AR 70-18 and HSC Reg 40-23. Careful monitoring of all approved protocols is conducted in order to assure strict compliance with the applicable regulations.

#### F. Problems

Most of our problem areas remain the same though there has been some encouraging progress in some areas. Our biggest problem continues to be adequate laboratory and administrative space. At the time the department moved into its present facilities, there were five assigned personnel occupying approximately 1850 square feet of space to work on 12 in-house protocols. At the present time, there are 23 assigned personnel working on 50 protocols in the same 1850 square feet. The addition of more equipment during the year has cut down on available work space.

Our desperate need for an animal facility was lessened somewhat by obtaining an old barracks-type building that was scheduled for destruction. Although it does not meet AALAC standards, it gives the department some capability for animal housing and operating room facilities. Our animal facility and space problems can be effectively resolved only with the completion of a major construction project for a separate building originally scheduled for 1984 but currently scheduled for 1987.

A total of 28 requirements have been approved for the Department and 22 authorizations have been allocated which has improved our personnel problems somewhat. Our principal remaining difficulty in personnel is in identifying and obtaining qualified military personnel. Severe shortages in Med Lab Specialists (92B), Biological Research Assistants (01H), Animal care Specialists (91T) and Veterinarians have taken their toll in keeping many of our positions empty.

### TABLE OF CONTENTS

Cost:	OMA Cost: \$1808	Review Results: Continue		

Objective: To Determine the serum opsonizing activity in selected patients in response to a polyvalent pneumococcal vaccine.

Technical Approach: Pre- and postimmunization sera were obtained from patients indergoing immunization against Streptococcus pneumoniae using polyvalent oneumococcal vaccine (Pneumovax MSD). These sera are being tested for opsonic activity directed against a number of serotypes of Streptococcus pneumoniae as well as other streptococcal species. A highly sensitive chemiluminescent assay has been developed for quantification of neutrophil (PMNL) leukocyte O<sub>2</sub>-redox actabolism, and this technique is being applied to the quantification of the large of opsonification for these sera.

Progress: Preliminary testing of selected pre- and postimmunization sera has been carried out. At present, the major difficulty is the preparation, stabilization, and quantification of the type-specific streptococcal antigen so as to insure uniformity of measurements.

In the course of investigation, important observations have been made with regard to interaction of streptococcal metabolic products, such as  $\rm H_2O_2$  and lactic acid, with PMNL myeloperoxidase. These observations have led to a collaborative study with Drs P. G. Quie and E. L. Mills of the Department of Pediatrics of the University of Minnesota. The results of this research have been published in the Journal of Infectious Disease 144:344-348, 1981.

Objective: to research	and develop a ra	pid, objec	tive, and qua	ntitative	
approach to the assessm	ment of phagocyte	activity in	n microliter	quantities of	
whole blood by introduc	tion of high quan	tum yield o	oxidizable su	hstrace and	
use of photomultiplicat	ion techniques to	quantitate	e chemilumine	scence (lumin-	
uscence resulting from	chemical reaction	).			

Tachnical Approach: The use of two difficure high quantum yield, oxidizable substrates for quantification of phagocyte 0,-redox activity in whole blood has been achieved. Both luminol, 5-amino-2,3-dihydro-1,4-phtbalazinedione, and toolgenin, 10,10'-dimethly-9,9'-blackidokam dimitrate, have been employed at this manner. Other substrates are also a der investigation. A technique beautiful of serum opsonic capacity, based on the rate of activation of the redox metabolism has also been established using chemilumigenic probes.

control of continuous and nondestructive assessment of oxygenation activity of MNL and conceptes. The results of differential probing, using probes adifferent physical characteristics and chemical reactivities, indicate that the oxygenation responses of MNL and money yes differ with regard to the type of stimulus employed. The technique allos measurement of PMNL and money the function in submicroliter quantities of whole blood.

With regard to the study of opsonification, important observations have been made on the roles of alternative and classical pathway complement, IgG and JeM in the mechanisms of bacterial opsonification. Furthermore, the chemicamigenic probe approach shows promise as a method for detection of circulating immune complexes.

Objective: To purify g				
tional subpopulations a				
evelle GMP after incuba	tion of the purit	fied cells	with the mito	gens for ' a co
8 Cc 1s.				

To mutual Approach: Guinea pig lymph node cells are separated into seven that it as using discontinuous gradients of 40-75% Percoll. The purified cells are exposed to various lectins and at different time periods the cells are lyst d with a precipitating reagent and the cyclic nucleotides extracted. The entry are purified by HPLC and measured by radioimmunoassay. Cyclic AMP and wells GMP levels are then correlated with the mitogenicity of the lectin, the time of incubation and the cell type. Cell populations are characterized by sright's stain and observation under a microscope for morphology and by functional immunoglobulin technique for T and B cell identification.

the projects: No significant progress was made on the project due to the lack of a high pressure liquid chromatograph. A high pressure liquid chromatograph and been obtained, and the development of a purification technique and analysis of samples can now proceed.

A unununtive MEDCASE	Est Accumulative	Periodic				
Cost:	OMA Cost: \$7,000	Review Results: Continue				
Thiertive: To investigate the roles of nonspecific and specific immunoglobu-						
lins and complement in e	effecting opsonizat	tion and microbicidal action of PMNL				

against various enteric invasive bacteria.

Figure 1 Approach: Bacterial cultures are grown in BHI broth and opsonized with serum from rabbits immunized with the given strain of bacteria. Scrum separated into IgG, IgM and IgA using either Sepharose 6B or DBAE Sephacia column chromatography. PMNL are separated from blood by either Dextran sedimination of PMNL Dy-redox metabolism as required for oxidative killing is measured by a chemiluminescent technique using luminals a chemilumigenic probe. Measurement of this PMNI-CL is accomplished has a Serkman LS 250 scintillation counter. Filling of organisms is measured at the end of each CL run by plating simples with appropriate controls a nutrient agar, incubating the plates overnight at 37°C, counting bacterial decrease and calculating an antibacterial index for each group of samples.

regress: A method which simultaneously measures PMNL-CL and bacterial of ling has been developed. This method will be used to analyze immuno-accounting and complement opsonic requirements necessary for stimulation of FMNL microbicidal activity and whether this activity results in decreased viability of the microbe. As such, Shigella sonnei phase I and phase II, Shige the flexneri hand 0 forms and perhaps various Salmonella strains will be distilled. During the course of development of this method we have found specific IgG to opsonize S. sonnei phase I in the absence of complement charges specific IgM requires the action of complement.

The leafs, patients with common variable agammaglobulinemia, or HPBL subtran suppressor cell stimulant are incubated in the presence of pokewerd transpleture, the cells are harvested and plated on slides in agar. The maglobulin cells are detected using the reverse hemolytic plaque assay. The maglobulin cells are detected using the reverse hemolytic plaque assay. The maglobulin cells are detected using the cells coated with protein A. The coated clides containing the cells are incubated with anti-human transpleture and complement to develop the plaques. The plaques are then the order of the power microscope. Increased numbers of plaques indicate the least ender of the power microscope. Plaque counts of normal patient excessed—normal patient cultures are compared to determine the presence of suppressor cell activity. Suppressed cultures incubated with immunomoduling larges are evaluated for release from suppressor activity.

reachest. Due to the shortage of agammaglobulinemic patients admitted to BAMC, the day has focused on studying the effects of immunomodulating drugs on in sitro artificially suppressed cultures. Development of a method to isolate T suppressor cells from these populations is also being developed. A preliminary report published as an abstract in Clinical Research indicated that several drugs that induce lupus symptoms were able to stimulate increased numbers of plaques after incubation with cells in culture. Further studies have also shown that steroids have a large capacity to stimulate plaque formation.

ginosa vaccine and hyper	immune globulin fo	or laboratory animals.	

Technical Approach: Ribosomal vaccines are prepared as described previously (0-7.77) from all available serotypes of P. aeruginosa. Rabbits are divided from two groups and each group is immunized with half the total number of vaccine preparations. (Prior to immunization the rabbits are bied to obtain a seman sera.) After the immunisation schedule, rabbits are bled for the immunisation schedule, rabbits are bled to obtain the immunisation schedule, rabbits are bled to obtain the immunisation schedule, rabbits are bled for the immunisation schedule, rabbits are bled to obtain the immunisation schedule, rabbits are bled for the immunisation schedule, rabbits are bled for the immunisation schedule, rabbits are bled for the immunisation schedule, rabbits are bled to obtain the immunisation schedule, rabbits are bled to ob

The second subunits by altra entrifugation through a sucrose density gradient. These ribosomal subunits against buffer containing 10-3M MC++ and the subunits separated by altra entrifugation through a sucrose density gradient. These ribosomal subunits are shown to contain a protective antigen, since antisera raised against the isolated subunits are capable of passive transfer of protection. To determine if a relationship existed between the ribosomal vaccine and outer membrane protein (OMP), a preparation of DMP was made from P. acruginosa and used to immunize rabbits. The following properties of the antisera to OMP were found: 1) antisera to OMP was capable of passive protection of mice against live Pseudomonas, 2) antisera to OMP showed serological reactivity of horizonal subunits using a complement fixation assay, 3) antisera to OMP. The precipitated with unfractionated ribosomal vaccine in outhterloney. The above results suggest relationship exists between a protective artigen associative with ribosomes and an outer membrane protein(s).

1 Oct 81 Proj No: Ongoing C - 4 - 81Status: TITLE: Chemiluatheseence (CL) in Populations of Immunocompetent Cells. Start Dace: 4 Feb 81 Est Comp Date: Dec 82 Principal Investigator Facility Payid G. Objective: To provide	a rapid and inexp	ensive meth	od to rep ou	ly prevent	
enzymatic degradation c					
enkephalin, and B endor					
ourst lares in plasma.					

reconical Approach: Known quantities of <sup>125</sup>I labeled endogenous opiates [Man Isaine enkephalin, Leucine enkephalin, and Bendorphin) were added to replace of whole blood made endogenous opiate poor by incubation at 37°C for two bours. The blood was either treated with NaF (6mg/ml) or ! N HCl with the liveine (100 pl/900 pl) + enkephalin extracted by MeOl via C-18 Seppak characteraphy. Total activity recovered was assessed for each procedure that effect of each procedure on the degradation enzymes was determined as of activity binding of the labeled enkephalins.

serious Since submitting the protocol, refinements in the acid extraction as include MeOH elution from a C-18 Seppak column of the enkephalins really increased recovery of enkephalin from plasma. Therefore the A NaF was assessed in terms of the modified procedure.

We tended to increase the plasma fraction of blood recovered compared to 1914 therefore diluting the  $^{125}\mathrm{I}$  activity/unit plasma. However, total activity recovered in the plasma phase by each procedure was not significantly different (75-78%). In excess of 90% of the activity was eluted by MeOb from the 0.18 Seppak. Slightly higher percentage of remaining activity was a compared to the NaF, proceeding localise non-enkephalin entities were eliminated in the extraction

C-16-81 (continued)

process. In this lab no increase in recovery by using NaF could be demonstrated compared to the refined acid extraction procedure. Although ease of use of NaF is an advantage, the ability to concentrate the enkephalins by drving the MeOH and redissolving the opiates in the proper assay buffer is of greater advantage. The further investigation of the use of NaF to prevent enkephalin degradation is therefore not waranted.

No publications are anticipated from this project although results will be incorporated into publications from related protocols.

semal protein antigen o	can protect mice b	y passive i	mmunization against		
challenge with P. aerus	giao <b>sa.</b>				

Jechnical Approach: Mice are immunized with the Pseudomonas ribosomal vaccine, and one are excised and spleen cell suspensions prepared. Spleen cells and symboma cells (obtained from another Laboratory where they are maintained in culture) are mixed in the presence of polyethylene glycol, resulting in a Lard a of the two cell types. The fused cells, called hybridomas, are then face-casein labeled with conjugated antigen. Next, the hybridoma cells are movesact by the Cluorescence activated cell sorter and plated such that andividual costs are deposited in separate wells of tissue culture plates and grown in culture for several weeks. The hybridoma clones produced are then te ded for entibody production to a particular antigen. Antibody positive A leading are subcultured and injected into the peritoneal cavity of mice. and security stand is then collected from the mice and should contain relaevent large amounts of monoclonal antibody. All monoclonal antibody preparof this will be tested for antibodies to both protein and LPS antigens and those preparations showing antibody activity to protein antigen only will be to ded for passive mouse protection. Preparation of Pseudomonas ribosomal we has and passive mouse protection experiments will be performed as preminusity described (0-7-77).

Progress: This protocol has just been initiated.

Objectives:

- 1. To develop new techniques in cardiac catheterization, especially in the area of multi-solid state sensor catheters including high fidelity pressure sensors and electromagnetic flow meters. To utilize high speed biplane angiography and external echocardiography in conjunction with such techniques.
- 2. To utilize these techniques to define sombisticated parameters of weather clar function in patients with various cardiac diseases.
- 5. To develop specialized computer-assisted analyses of the cuta derived from such studies.
- 4 to quantitate left ventricular hydraulic output jower.
- To measure additional pulmonary artery input impedance by Fourier analysis of the tree effect of changing physiologic states upon the impedance.

The evaluated in the usual manner by a cardiac fellow prior to catherize the evaluation includes strip chart echocardiography to determine antime suitability for certain aspects of the protocol. During cathetermine special, custom-designed, right and left heart catheters are introduced as the right and left heart such that simultaneous high fidelity pressures are descent from the pulmonary artery, right ventricle, right atrium, left ventrible, and aprile. In addition, electromagnetically derived aortic and pulmonary entry and aortic pressures are obtained. Patients are studied during rest semine exercise, and depending upon the patient's disease during a variety of stresses or pharmacologic interventions. Some patients also undergoding theorems external echocardiography during catheterization. The study is terminated after bi-plane ventricular anglography and coronary actoriography it indicated.

Progress: Significant progress during FY 1981 resulted in publications in Progress Ancluding: aortic input impedance in normal man and left ventricular

# 2 ~ P (continued)

ejection dynamics in patients with hypertrophic and congestive cardiomyopathies. Currently work is in progress to evaluate the fluid dynamic changes responsible for subvalvular gradients in patients with aortic stenosis. Concurrently data analysis continues in ten patients from whom pulmonary artery impedance spectra were obtained in a high-fidelity micromanometry. It is anticipated that software development for computer-assisted data analysis will commence in the near future and will be carried out under new protocols as they are approved.

Complement				
Cell mediated immunity				
Accumulative MEDCASE	Est Accumulative	Periodic		
Cost:	OMA Cost: \$4,476	Review Results: Co	ntinue	

Objectives: To determine whether the cleavage of complement component (...) by activated C1 and C4 takes place in the fluid phase.

To determine whether generation of breakdown products of C2 correlates with the modulatory effect on lymphocytes.

To investigate the effect of intact vs cleaved  ${\tt C2}$  on the generation of suppressor T cells.

Progress: Purified human C1, C4 and C2 are sequentially added to a suspension of peripheral blood lymphocytes in complement fixation buffer in a ratio of 1 15. Aliquots of the supernatants are withdrawn at 10, 20, 40 and 60 ms area, and kept frozen at -70°C until they can be assayed for residual C2 activity. At each time interval stated, the lymphocytes are sedimented, ushed free of complement fixation buffer and resuspended in RPMI 1640 to be appraise normal cells.

Progress: The main obstacle to the successful completion of this study has been our imbility to obtain fresh EAC14 cells. As a result, we have not been the to measure residual 62 hemolytic activity. We are renewing our efforts to coordinate the shipment of cells so that we may obtain them within 24-48 hours of their shipment.

Objective: To establis	sh whether in vivo to	etracycline labeling can be used t	
aid the endogcomist in	locating pathologic	nulmonary tiegues when viewed	

Objective: To establish whether in vivo tetracycline labeling can be used to aid the endoscopist in locating pathologic pulmonary tissues when viewed through a fiberoptic bronchoscope incorporating an ultraviolet light source.

Technical Approach: Antimicrobials of the tetracyclihne family are known to exhibit a characteristic fluorescence under ultraviolet light. It is also known that tetracycline will concentrate in abnormal tissues such as tumor. For this reason, it has been theorized and subsequently shown that patients given tetracycline can have an induction of a bright yellow fluorescence which c a be seen under ultraviolet light in various tumor tissues. It is therefore proposed that patients who are suspected of having lung cancer who will undergo fiberoptic bronchoscopy be treated with tetracycline 250 mg q.i.d. for four days. At the time of fiberoptic bronchoscopy, if tumor tissue is seen, it would be biopsied, and no further procedures done. However, if no abnormal tissue is seen under routine fiberoptic bronchoscopy, then the patient would be examined with an ultraviolet light source. At that time, if an area of abnormal fluorescence is seen, a biopsy would be done in the routine fashion. Patients to he studied would include all patients who have consented to have the procedure performed, who would otherwise have an indication for fiberoptic bronchoscopy, i.e., patients with suspected lung tumors.

Progress: Due to personnel shortages and technical difficulties, no progress has been made on this protocol.

Proj No: C-9-79 Status: Terminaled TITIE: Evaluation of Antidiar, Lomotil and Placebo in Acute Diarrheas Start Date: 6 Feb 79 Est Comp Date: Principal Investigator Facility Leonard Duran, M.D., CPT, MC Brooke Army Medical Center Dept/Sec: Associate Investigators: Ernest L. sician extenders, can be validated as effective in an outpatient population.

To utilize the process of outcome data generated by the AMOSISTs and internists to generate new clinical algorithms of measurable cost and outcome.

buical Approach: Data were collected by medical corpsmen in the walk-in nic and emergency room using a common checklis. The itemson the checklist were chosen, based on an extensive literature review, to detect serious or portenailly serious conditions causing headaches and to discriminate between tension and migraine headaches.

Four weeks after each encounter, research assistants reviewed each mattern's record and contacted the patient by telephone to determine the stress of the illness. An internist who was not involved in the patient's ace used the checklist, follow-up, and the other data in the medical record to assign a diagnosis.

Progress: Seven hundred twenty six patients presented with acute headaches which were diagnosed as tension (38%), migraine (25%), no diagnosis (30%) and other (6%). No patient had a life-threatening diagnosis. Although the internist making diagnoses had access to a great deal of information in addition to the initial clinical data for each patient, a simple rule based on 3-7 of the initial findings could duplicate his diagnostic decision with at least 80% accuracy.

Technical Approach: This study was to be a double-blind study using mite extract in immunotherapy from patients with clinical housedust sensitivity.

Progress: This study has been terminated. Our assumption for this study was that mites are an important allergen to housedust and that mites should therefore be present in housedust samples. It is now clear, however, that in San Antonio (and probably throughout the southwest), most homes do not contain dermatophagoides mites, most likely because the relative humidity is too low for their survival. No patients were enrolled into the study.

Myocardial toxicity				
Adriamycin				
Accumulative MEDCASE	Est Accumulative	Periodi		
Cost:	OMA Cost:	Review	Resuits: Co	ntinue
	mine whether digoxin, g chemotherapy regimen			

Technical Approach: Cancer patients to be treated with Adriamycin will be alternately assigned to one of two groups: (a) digoxin-treated, or (b) control. In order to assure equitable distribution of patients by age, sex and tamor type, participating medical oncologists will be aware of and adjust patient assignments as necessary. Participating cardiologists will be unaware of which patients are receiving digoxin and, therefore, all echocardiographic

of myocardial toxicity in cancer patients.

results will be interpreted by "blind" observers.

Digitalization of the digoxin-treated group will consist of the administration of 1.5 gm digoxin PO in divided doses for two days. Serum digoxin levels will be obtained from digoxin-treated patients prior to starting Adriamycin and before each echocardiogram.

All patients will undergo routine echocardiographic evaluation by m-mode technique, a method commonly used to evaluate cardiac function in patients on Adriamycin.

Progress: Approximately 7-10 patients are still needed on the Digoxin treated arm to complete this study. Patient accession has been slow secondary to patient early removal from study for progressive disease and patients being treated at facilities (other than BAMC) without echocardiography capabilities.

Objective: To determine the safety and efficacy of sulconazole nitrate 1%			
solution in the once-a-day, three-week treatment of tinea versicolor in adul			
men and women as compared to placebo solution.			

Technical Approach: This was a double blind study of Sulconazole Nitrate solution versus placebo applied to tinea versicolor lesions once daily for three weeks. KOH and Wood's lamp examination at two weeks and three weeks. If KOH was negative at three weeks, treatment was stopped and patient re-evaluated four weeks later.

Progress: Twenty-three patients completed the study. Twelve patients treated with placebo showed no evidence of clearing. Fungus was demonstrated by KOH. Elevent patients treated with Sulconazole Nitrate cleared completely, and KOH was negative by three weeks. It was concluded that Sulconazole Nitrate was superior to placebo in treatment of tinea versicolor.

At the request of the drug company, an additional 36 patients will be studied on this protocol.

Cost:		OMA Cost: \$2,1	143 Review Results:
Objectives: dialysis.	To assess	granulocyte func	tion in nephrology patients undergoin

To assess serum opsonic capacity in these patients.

To investigate the relationship between dialysis associated activation of complement and the neutropenia observed during the initial phase of dialysis.

To assess peritoneal macrophage function in patients undergoing peritoneal dialysis.

Technical Approach: Blood samples are obtained from the arterial and venous tubings of patients undergoing routine hemodialysis. These samples are then taken to the laboratory where white cell counts and differentials are obtained and samples of the white cells are assessed for their opsonic capacity using several different molecular probes. Serum samples from each experiment are frozen and saved for batch analysis of complement components including molecular fragments.

Progress: Twelve patients have been studied in detail using a variety of different methodologies. From the basis of the data developed thus far, six patients will be restudied with analysis using a standard methodology which should permit tighter grouping of the mean data.

Objectives: To evalua	te and characterize t	he coagulation, fibrinolytic and		
humoral immune abnorma	humoral immune abnormalities induced in patients envenomated by Crotalus			
atrox (western diamond)	oack rattlesnake).			

Technical Approach: Coagulation tests as outlined in the protocol are being performed on snakebite patients. Serum and plasma specimens are stored at  $-70^{\circ}\mathrm{C}$  for further evaluation to include chemiluminescence technique for the evaluation of opsonic function and complement activity. Venoms collected from C. atrox specimens of different sizes were preliminarily tested for possible differences in coagulant vs fibrinolytic activity. Significant differences were noted and venoms were subsequently obtained from three different size ranges of snakes. Thrombin-like activities and fibrinolytic activities were evaluated on all individual venoms. Further characterization of the procoagulant and fibrinolytic processes involved is being performed using plasma and fibrinogen coagulation procedures.

Progress: Specimens from 24 snakebite victims have been collected and stored in frozen aliquots. Twelve of these patients were serially collected on subsequent days. Approximately one-half of the total amount of coagulation procedures to be performed on these are completed. Chemiluminescence procedures will be performed when all specimens are received. Although coagulation abnormalities and clinical bleeding problems have been observed in several of these patients, final conclusions are pending completion of tests and rest of patient group.

Cost:	OMA Cost:	Review Results: Continue
Objectives: Prospective	e evaluation of neu	itrophil function and humoral immunity
in patients with leuker	ia.	

Evaluation of changes induced in humoral immunity and neutrophil function by either radiation therapy or chemotherapy.

Evaluation of kinetics of transfused neutrophils in leukemia patients.

Correlation of improvement in neutrophil function and humoral immunity in recipients of granulocyte transfusions and clinical course.

Technical Approach: Baseline evaluation of the patient's humoral opsonic capacity will be performed. Granulocyte redox function will also be studied. Additional studies will be performed with routine CBCs during the induction phase of chemotherapy. Once a patient has entered remission of his leukemia, a repeat study will be performed on a monthly basis. Serum opsonic capacity and granulocyte redox function will be assayed by the micro technique of probe amplified chemiluminescence.

Progress: Only one patient to date has been studied. This is secondary to low patient accrual with no patients needing granulocyte transfusion in the last 10 months at Brooke. If sufficient patients cannot be accrued to this study over the next year, it will be terminated.

Objective: To study the n		-		•

following an insect sting. Several aspects of this problem will be studied:
a. What is the risk of systemic anaphylaxis in this group of patients? and
b. Can patients with histories of LLR and at risk of anaphylaxis be identified prospectively.

Technical Approach: Patients who meet the above objectives will undergo the following:

- a. Venom skin testing up to 1 ug/ml of concentration.
- b. Obtain specific venom IgE and IgG.
- c. Stay challenged under controlled conditions to assess current reactivity.
  - d. Obtain specific venom IgE and IgG's following sting challenge.

Progress: Eight patients with positive skin tests to venom have been entered into the study. None of these patients have consented to in-hospital study. The plan for these patients is to follow-up on field stings when it occurs.

Objective: To study se	veral different meth	ods by which Infect	ion Control
personnel might search	for nosocomial infec	tions, as well as t	he method

presently employed at Brooke Army Medical Center (BAMC), in order to define clearly a system which would most efficiently achieve the goals of surveil-

lance for nosocomial infections.

Technical Approach: Data for this study will be collected on McBee Keysort cards. A card will be initiated for each patient whose chart is actually reviewed by a member of the Infection Control Surveillance Team. Charts will be selected for review on the basis of the presence of one or more of the nine screening clues (positive culture, fever, antibiotic therapy, a verbal report, presence on an ICU, isolation precautions, hospital stay of il days or more, and leukemia) disclosed during survey activities. During the chart review, the presence of additional factors associated with NI will be noted on the "Also Present" column. A determination as to whether or not a NI is present will be made. As appropriate, the site will be indicated. Follow-up on the patient will be noted simply by initiating a new key, art card for each review of the chart with entries being confied to the small section devoted to follow-ups.

 $^{\rm p} {\rm rogress};$  Initial review of the data is inconclusive. Further study is indicated.

pare the	s: Isolate segment adherence ability of estinal segments.	s of <b>s</b> mall i	nte <b>sti</b> ne fr	rom adult rab	b.t. and com-

Indirectly examine the various segments of intestine to determine if there are any differences in the carbohydrate content between receptor positive and receptor negative intestinal segments.

Determine the role the host receptors for RDEC-1 located on the intestinal muchsa by orally challenging receptor positive and receptor negative rabbits.

Technical Approach: Four adult female New Zealand white rabbits will be mated with designated male rabbits, and their litters allowed to be maintained as naturally as possible by the mother. On days 18, 21, 24, 28, and 35, infant rabbits from each litter will be sacrificed and segments of rabbit small intestine will be frozen rapidly in isopentane. Frozen intestinal tissue will be sectioned in a cryostat and an attempt will be made to identify the specific sogar units which may constitute the receptor for RDEC-1 and E. coli which has specific adherence to rabbit small bowel. For this, the tissue will be exposed to different lectins, which are sugar specific proteins, in an attempt to block adherence of RDEC-1 over the sectioned tissue after exposure to the lectins. An indirect immunophorescent technique will be used to identify RDEC-1 adherence.

first two litters were born in mid-August. In the last six weeks, we have sacrificed the rabbits following the schedule outlined above. The frozen tissue is being kept in the Department of Clinical Investigation. At the present time, some of the lectins have not been received, and we are waiting for these so we can go into the second part of the experiment.

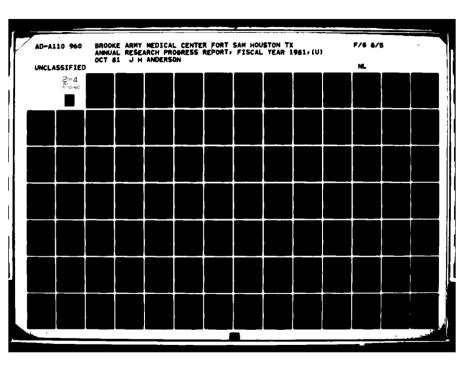

Date: 16 Oct 81 Proj No: C-25-81 Status: Ongoing TITLE: Single-Dose Treatment of Urinary Tract Infections in Women Start Date: 1 Apr 81 Est Comp Date: Sep 82 Principal Investigator Facility C. Kenneth McAllister, M.D., LTC, MC Brooke Army Medical Center Dept/Sec: Associate Investigators: Department of Medicine/Infectious Disease AMOSIST personnel Key Words: Urinary Tract Infection Accumulative MEDCASE Est Accumulative Periodic OMA Cost: Review Results: Continue Objective: To investigate the efficacy and safety of treating women with uncomplicated UTI's of the lower urinary tract with a single dose antibiotic.

To demonstrate a cost savings to the US Army by utilizing a single dose of antibiotic therapy for UTI vs 10-14 days of convential therapy.

To provide a convenient means of treating UTI which optimizes patient compliance and follow-up.

Technical Approach: Twenty-six women entered into the study. Study design such that only adult women ages 18-55 with symptoms/signs compatible with cystitis are given 3.0 grams amoxycillin single dose therapy (SDT). SDT patients receive urine culture plus gram stain prior to therapy; and at 5 to 9 days, then the final culture at 4 weeks post treatment.

Progress: Results thus far are 90% curative at initial follow-up. No conclusions have been drawn at this point other than efficacy and safety has been confirmed.

Objective: To study	the effect of the use	of sterile globes during the inser

Objective: To study the effect of the use of sterile globes during the insertion of intravenous catheters on the incidence of infection of indwelling intravenous catheters and sepsis secondary to intravenous catheter infection.

Technical Approach: Participants will be divided into two groups. Group 1 will have the IV inserted by one of the investigators with the added precaution of wearing of sterile gloves. Group 2 will have the catheter inserted in a similar manner but without sterile gloves. Skin cultures will be taken before and after placement of the IV.

The following variables will be analyzed: Relation of technique of insertion to (1) incidence of pre and post-insertion postive skin cultures, (2) incidence of positive catheter culture and time to occurrence, (3) incidence of phlebitis and time to occurrence and (4) incidence of catheter being the source of bacteremia to occurrence.

Progress: Due to a change in principal investigators, no progress has been made.

Objective: To invest	igate chromosomal abno	rmalities in basal	cell epithe-
lioma cells and to in	itiate a cell culture	line for this and for	irther studies

Technical Approach: Part of the tissue specimen taken for biopsy for basal cell carcinoma is taken to the lab and pure BCC islands devoid of fibrous stroma are torn out, chopped up and placed in cell culture media and then incubated.

Progress: Progress has been virtually nil due to several problems, most notably the cell culture lines becoming infected and discarded within 48 hours. Antibiotics added to media so fat has not helped.

Objective: To evaluate the with different types of tu	in vitro sy	nthesis of	immunoglobul:	ins in patients

To determine whether suppressor T-cell activity is increased in patients with lymphoma as compared with solid tumor patients.

To assess the effect of chemotherapy on immunoglobulin synthesis and suppressor cell activity in both groups of patients.

Technical Approach: 20 cc of blood are obtained from each patient by venipuncture. Peripheral blood lymphocytes are isolated by sedimentation on Ficoll-Hypaque. The cells are assayed for their proliferative responses to mitogens and their ability to synthesize immunoglobulins by a reverse hemolytic plaque assay. Mixed lymphocyte cultures are also carried out to determine the cells ability to suppress proliferation and antibody synthesis by normal lymphocytes.

Progress: Forty-eight patients have been studied so far in nine separate experiments. Twelve of the patients were studied before and after chemotherapy. There were no significant differences in proliferative responses or antibody synthesis. However, there appears to be decreased suppression of normal cells after therapy.

Aortic impedance				
Congestive cardiomyopa	thy			
Cardiac catheterization	1			
Accumulative MEDCASE	Est Accumulative	Periodic		
Cost:	OMA Cost:	Review Results:	Continue	

Objective: To evaluate the role of afterload reduction and exercise on the aortic impedance profile of patients with congestive cardiomyopathy.

Technical Approach: Patients admitted to this study have undergone elective cardiac catheterization to evaluate the possibility of surgically correctable problems and to assess the hemodynamic response to afterload reduction by nitroprusside and exercise. Routine left and right heart catheterizations were performed. High-fidelity multisensor pressure velocity catheters were employed to obtain simultaneous aortic pressure and flow-velocity information. This data was stored on electromagnetic tape and submitted to a computer for Fourier analysis following the catheterization procedures. Standard hemodynamic parameters were evaluated and the aortic input impedance spectra plotted.

Progress: To date, data have been obtained from ten patients with congestive cardiomyopathy. Work continues in data analysis and a preliminary statistical analysis has been performed. Nipride increased cardiac output and reduced left ventricular end-diastolic pressure. No significant change in heart rate was found. Exercise resulted in an increase in heart rate, slight change in cardiac output and significantly increased pulmonary capillary pressure.

Date: 16 Oct 81 Proj No: C-33-81 Status: Ongoing TITLE: Renal Function in Primary Hyperparathyroidism 12 May 81 Est Comp Date: May 83 Start Date: Principal Investigator Facility Lucius F. Foulks, M.D., MAJ, MC Key Words: Hyperparathyroidism Renal function Accumulative MEDCASE Est Accumulative Periodic Cost: OMA Cost: Review Results: Objective: To gather detailed information about renal function in patients with primary hyperparathyroidism at the time of diagnosis, and to follow these functions serially in patients not undergoing surgery. These data should permit a more precise estimate of the risk of "medical" therapy versus "surgical" therapy in patients with mild, asymptomatic, primary hyperparathyroidism.

Technical Approach: Patients entered into this study are being admitted to the hospital for 5-days of metabolic balance studies and renal function tests which include the ability to concentrate and dilute the urine. Response to ammonium chloride loading and bicarbonate administration, calcium excretion and assorted data on endocrine function including parathyroid hormone assays are also being obtained at the same time.

Progress: To date seven patients have been entered and completed the first phase of the study and are now being followed in the Renal Clinic. Three more patients have been identified who are suitable for entrance into the study and will be studied when facilities are available.

Objectives: '	To determine	the response	rate of henat	ic emboliza	tion of primar	

Objectives: To determine the response rate of hepatic embolization of primary or metastatic neoplasia in liver.

To evaluate the morbidity of hepatic embolization.

To evaluate the response rates of patients undergoing embolization with metastatic disease to liver to a historical control group.

Technical Approach: Hepatic artery embolization using Ivalon particles for peripheral embolization and steel coils for proximal embolization was utilized in the management of patients with hepatic neoplasm. Nine patients with regionally confined disease in the liver and who had failed either hepatic artery infusion or systemic chemotherapy were eligible. Embolization was carried out through a percutaneous femoral approach. Hepatic artery placement was verified by angiography

Progress: Six patients with colon cancer and one patient each with hepatoma, squamous cell carcinoma and uterine leiomyosarcoma make up the study group. Seven patients are still alive with two patients deceased. No deaths were attributable to the embolization procedure. Median follow-up time is 3 months. The longest follow-up is eight months with the patient alive and with stable disease in the liver. Although this study is limited by the short follow-up period and few numbers of patients, hepatic artery embolization may be useful in the management of regionally confined hepatic neoplasm.

American Color of the Control			1 1	

Objective: To compare Gray-scale ultrasonography and abdominal computed tomography to infusion nephrotomography in establishing the diagnosis of adult-type polycystic kidney disease in asymptomatic persons at risk.

Technical Approach: Children of patients known to have polycystic kidney disease who agree to be screened will have infusion nephrotomography, Gray-Scale ultrasonography and abdominal CT scan with and without contrast enhancement to assess them for the presence of polycystic kidney disease. The patients who are to be studied have a 50% risk of having inherited the disease from their infected parent. These studies will be reviewed all at one time after they are obtained by investigators who are blinded to the results of the other studies.

Progress: Thus far, four subjects have been entered into the study, and approximately fifteen others have been identified who are likely to qualify for admission.

Hypoparathyroidism		
Accumulative MEDCASE	Est Accumulativ	e Periodic
Cost:	OMA Cost:	Review Results:

Objective: To determine if  $\mathrm{H_1}$  and  $\mathrm{H_2}$  receptor blockade singly or in combination cause a reduction in serum concentrations of parathormone and ionized calcium in a patient with hypoparathyroidism.

Technical Approach: A patient with hypoparathyroidism was placed on a metabolic diet off all diuretics, calcium, and vitamin D supplements. Once serum calcium stabilized, the patient was started on thiazide diuretic and salt-restricted diet in an attempt to raise serum calcium levels (Porter et al NEJM 298:11577, 1978). Patient still required supplemental calcium and vitamin despite these measures. He was then challenged with cimetidine for three days which failed to produce any decline in serum.

Progress: Patient's serum calcium was 7.0-7.2 mg% at the initiation of the study. With the restriction of sodium intake and administration of thiazide diuretics, serum calcium declined even further to less than 6.0 mg%. Electrocardiogram showed Q-T prolongation and patient had positive Trousseau's sign at this point in his course. On hospital day nine, 1.25-dihydroxy Vitamin D was started along with calcium supplements. Serum calcium increased over a period of several days to about 8.0 mg% and remained stable at that despite subsequent challenge with cimetidine. Joint challenge with H<sub>1</sub> receptor blockers (hydroxyzine) and H<sub>2</sub> receptor blockers (cimetidine) were not performed due to fact patient had already spent three weeks in the hospital.

4		ration of Indomethacin a will prevent the deve	•

esophagitis

Technical Approach: Patients receiving radiation therapy for different mediastinal tumors in a port that will include radiation to the esophagus will be randomized blindly into four grous - one a group of controlled subjects and three groups which will receive three different dose levels of Indomethacin, an agent that has been demonstrated in animal studies to be protective for radiation-induced esophagitis. The patients will undergo, prior to radiation therapy, esophagoscopy with photographs, with biopsies and brushings being taken at this time. At the completion of radiotherapy, each patient will undergo a second endoscopy with biopsy, photography, and collection of serum specimens. The patients will be asked to report any difficulty with odynophagia or dysphagia at weekly intervals. The treatment group will be compared with the contorl goup and with each other using Student's Test and a one-way fixed effect model analysis of variance.

Progress: This is a new study. The placebo tablets have been obtained and, in the course of the next few weeks, we intend to go ahead with the coding of the placebo and the Indomethacin tablets. We expect to start including patients in the study in the near future.

Dept/Sec: Department of Medicine/Allergy-Immunology		Associate Investigators: Gwenesta Melton, M.D., CPT, MC	
Key Words: Allergen			
Nasal mucous membrane			
Accumulative MEDCASE	Est Accumulative	Periodic	·
Cost:	OMA Cost:	Review Results:	Continue
Objective: To invest	igate further the phen	oeman of mucous memb	rane priming

Objective: To investigate further the phenoeman of mucous membrane priming by antigens. Several aspects of the problem will be studied: a. Does it occur in different aeroallergen systems? b. Is the priming effect on the nasal mucosa specific for the allergen that induces it? c. What is the effect, if any, of antihistamines, intranasal corticosteroids and cromolyn sodium on nasal priming? d. Is the priming effect due to an increase of specific IgE?

Technical Approach: Study subjects will be challenged intranasally to the appropriate allergens over auccessive days to prime their mucus. By challenging with a different allergen to which the patient is also resistive, we will determine if the phenomenon is specific or not. Also, antihistamines, corticosteroids and cromolyn sodium will be used prior to the study to determine whether priming can be pharmacologically inhibited. Specific IgE (by RAST) will then be obtained.

Progress: The equipment necessary to perform nasal airway resistance measurements is not available. We are waiting for MEDCASE items to be purchased so this project can be started.

Cost:	OMA Cost:	Review Results: Continue

Objective: To compare the safety and efficacy of sulconazole nitrate 1% cream in the treatment of symptomatic tinea pedis in adult men and women as compared to that of miconazole nitrate 2% cream.

Technical Approach: Patients will be treated once a day for four weeks with either sulconazole or miconazole nitrate cream. The two drugs will be randomly assigned. Patients will be examined on initiation of therapy, at two weeks, and on completion of four weeks of therapy. Patients who are KOH negative after four weeks of therapy will be re-examined at eight weeks to determine the incidence of relapse.

Progress: This is a new study.

		Intimal thickening of uterine arteries
with oral contraceptiv	e use in women und	ergoing hysterectomy with and without

cervical and uterine pathology.

Technical Approach: All patients undergoing hysterectomy by an abdominal or vaginal route are eligible for the study and will have their operation performed in the standard manner. The operative specimen will be taken directly by the pathologist for both electron microscopic and light microscopic fixation and preparation. Sections will be made of both uterine and myometrial vessels and examined for intimal thickening and other abnormal vascular changes. The patients will be divided into study groups for comparison as follows: Group I - no hormonal exposure; and Group II - hormonal exposure, 50-100 micrograms, for 1 year, 1-2 years, or 2 years or more.

Progress: This project was temporarily delayed due to inability to obtain pathological data. This situation has been rectified and patients are once again being enrolled on the study.

Accumulative MEDCASE	Est Accumulative	Periodic
Cost:	OMA Cost:	Review Results:
Objective: To determin	ne whether Fluorourac	il cream is a better therapeutic

Objective: To determine whether Fluorouracil cream is a better therapeutic agent with less side effects and toxicity than Podophyllum.

Technical Approach: Participants in the study were divided into two groups. To insure the groups were scientifically comparable, they were stratified based on the size and number of lesions. Group I was treated with 5% Fluorouracil cream for 5 days each week x 4 weeks. Group II received on application of podophyllum once each week x 4 weeks.

Progress: Sixteen patients were entered into the study. In Group II six patients were treated; three were stratified in the less than 1 cm group, and three were greater than 1 cm. In Group I three patients had lesions less than 1 cm and seven had lesions greater than 1 cm.

The overall average response was a response grade of 3.3 in 3 weeks for fluorouracil versus a response grade of 2.7 over 3.5 weeks for podophyllum. Though these numbers are still insufficient to be significant, the 5-FU appears to be more efficacious in the larger condyloma than podophyllum.

## Detail Summary Shoot

Objective:	To establish	at Brooke Army	Medical Cen	ter the capal	pility to

Objective: To establish at Brooke Army Medical Center the capability to study demyelination and remyelination of mammalian central nervous tissue in a reliable cell culture laboratory model.

Technical Approach: Minced newborn mouse cerebellum is cultured in Eagle's basic medium enriched with fetal calf serum and glucose at 35.5°C in a 5% CO<sub>2</sub> incubator. Twice weekly the cultures are washed and fed. Using an inverted tissue culture microscope and 35mm camera attachment, the growth and eventual decline of the colonies is documented.

Progress: Continuing efforts to establish a reliable mammalian central nervous system tissue culture laboratory model for the study of demyelination and remyelination have been frustrated by the lack of consistency of our results. Originally, the cultures were of excellent quality but recent attempts to culture the tissue have been associated with bacterial contamination and failure to grow. Steps being taken to correct these problems include media changes, the use of different incubation techniques, and re-evaluation of our technique (especially regarding sterility).

Date: 20 Oct 81 Proj No: C-64-81 Status: Ongoing TITLE: Detection of Rotavirus in Selected Pediatric Patients Utilizing Rotazyme, Rotavirus Diagnostic Kit Start Date: 23 Sep 81 Est Comp Date: Aug 82 Principal Investigator Facility Thomas R. Perez, DAC Brooke Army Medical Center Dept/Sec: Associate Investigators: Department of Pathology/Virology S. Vern Juchau, M.D., LTC, MC Key Words: James Higbee, Ph.D., MAJ, MSC Rotavirus George J. Kasai, Ph.D., Rotazyme, Rotavirus Diagnostic Kit Paula Mosman, DAC Accumulative MEDCASE Est Accumulative Periodic Cost: OMA Cost: Review Results: Continue Objectives: To field test the Rotazyme Kit as a possible new diagnostic procedure for detection of active rotavirus infections in pediatric gastro-

To provide a definitive rotavirus diagnosis allowing physicians to make a proper diagnosis and alert him to potential complications.

To potentially reduce the use of antimicrobial agents

To provide better patient management.

To determine BAMC area seasonal period for rotavirus infections.

Technical Approach: A stool sample will be submitted for rotavirus and bacterial culture. If a stool sample is impractical, a rectal swab may be submitted using a "Virocult" for rotavirus study and a bacterial "Culturette" for bacterial culture. The stool/rectal swab submitted will be processed by standard methods for detection of other possible viral agents. Specimens will also be analyzed using the Rotazyme, Rotavirus Diagnostic Kit.

Progress: This is a new study.

Opsonic	capacity					
Phagocy	tic function					
Newborn						
Accumu1	ative MEDCASE	Est Accumulati	ve Perio	dic		
Cost: OMA Cost: \$270			Revie	Review Results:		

Objective: To employ recently devised chemiluminescent techniques to investigate the humoral-phagocyte axis of immune defense in neonates. In particular:

- A. Opsonic activity of neonate and maternal serum to different bacterial antigens.
- B. Assessment of classical complement activity and also alternative complement activity in neonates with comparison to maternal and control adult serum.
- C. Assessment of neonate polymorphonuclear leukocyte microbicidal metabolic responsiveness to immune and non-immune stimuli.

Technical Approach: Maternal bloods were collected by venipuncture with the routine laboratory blood specimens at the time of presentation in labor. Infant blood were collected from the ligated umbilical cord at delivery. At three days of age, blood is routinely obtained from the infant for PKU determination. Any additional drops of blood will be collected at this time and used for PMNL testing and where possible for measurement of opsonic capacity. At two weeks of age a repeat PKU is drawn by heel stick. Any additional drops of blood will be collected and assayed as described above.

Progress: The results indicate that maternal specific activity is high-normal using the luminol-opsonified zymosan technique. This view is consistent with the observation that myeloperoxidase activity is higher in pregnant females. The specific activity of newborn cord blood phagocytes was, however, significantly depressed relative to maternal or control specimens. The specific oxygenation responses using DBA-PMA were

# C-6-81 (continued)

equivalent for control and maternal specimens; but once again, the newborn specimens were depressed as measured by this technique. The results support the conclusion that both myeloperoxidase and superoxide associated oxygenation by phagocytes in newborn whole blood are depressed at the time of birth.

Proi No: Status: Date: 1 Oct 81 C-35-74 Onging TITLE: Clinical Evaluation of Cisternography Utilizing 111 Indium DTPA. Start Date: 25 Jan 74 Est Comp Date: Indefinite Principal Investigator Facility Robert J. Objective: To evalu	ate the clinical eff	icacy of To	-99m-PC as a	diagnostic	

Objective: To evaluate the clinical efficacy of Tc-99m-PG as a diagnostic hepatobiliary and gallbladder agent.

Technical Approach: The patient is injected with 15 millicuries of 99m technetium labeled pyridoxylideneglutamate (PYG) with images obtained every 5 minutes in the anterior projection. In normal persons, activity is promptly seen in the liver, and then concentrates in the biliary tree with visualization of the gallbladder usually by 30 minutes after injection and evidence of activity within the bowel shortly thereafter. The scan is most useful for evaluating acute cholecystitis in which the gallbladder is not visualized because of obstruction of the cystic duct. The scan is also useful for evaluating patency of the biliary tree into the bowel and also for evaluating surgical anastomoses and shunts involving the biliary tree.

Progress: During the past year four patients were scanned. Although the studies provided very useful diagnostic information, the protocol was terminated due to the availability of a new product (99mTc Diethyl-IDA) which provides information considerably more useful in diagnosing the integrity of the hepatobiliary system.

Objections To coi	n a hottor understandi	as of the relationship of a hornisted

Objective: To gain a better understanding of the relationship of a herniated nucleus pulposus to the epidural and subarachnoid spaces.

Technical Approach: The spines are prepared at the time of autopsy in the following manner: a mixture of Knox gelatin, Renografin M-60 and acrylic paint is heated to approximately 80°C and then cooled to room temperature while stirring. The mixture is subsequently injected as a liquid into the epidural space, the vertebral bodies of L4 and L5, and the subarachnoid space. The specimen is cooled after it is removed which allows the injected mixture to gel and harden. Then CT of the lumbar spine is performed. Finally, the specimen is frozen solid and ban-sawed in as nearly as possible the same plane as that used for the CT sections. The ban-sawed sections are then thawed and photographed in color.

Progress: Four cadavers were examined in which we demonstrated vividly the relationship of the epidural space to the rest of the spaces within the spinal cord. This new information helped us in appreciating abnormalities on epidurograms we performed on 35 patients with low back pain in whom the clinical findings or myelograms were equivocal.

Objective: To evaluate	the clinical eff:	icacy of 99mTc-EHIDA as a hepato-		

Objective: To evaluate the clinical efficacy of 99mTc-EHIDA as a hepato-biliary agent.

Technical Approach: Each patient is studied following a 4-6 hour period of fasting (when possible). Following IV injection of 7-15 mCi of Technetium 99m Diethyl-IDA, simultaneous computer acquisition is performed for further delay analysis. After nuclear images are stored, distribution curve data is derived. Initially, views will be obtained every 5 minutes post injection for the first 30-45 minutes. Additional views are obtained at one hour and 24 hours if obstruction is suspected. If the gallbladder does not visualize in 1-2 hours, acute, chronic cholecystitis or gallbladder dysfunction is suspected.

Progress: During the past year, 75 patients were scanned utilizing this procedure. The results have been remarkable and provided extensive diagnostic data. This procedure provides a safe, rapid, non-invasive evaluation of the hepatobiliary system. Information acquired on patients in many cases eliminates the need for more invasive studies.

Objective: To avoid the	major com	plica	tions, suc	h as spermatic	granuloma of	
the vas, epididymal disc	omfort and	pain	due to in	travasal press	ure buildup	

Technical Approach: Under local anesthesia and through separate scrotal incisions, each vas is isolated, ligated distally with Weck clips, the distal end returned to the scrotum, the proximal (testicular end of each vas sptulated and anastomosed to the lower edge of the incision with 4-0 chromic catgut, as a stoma.

and spontaneous recanalization which often occur in patients who have a vas-

ectomy performed in the conventional manner for surgical sterility.

Progress: Seventy-eight patients that presented to the Urology Clinic for elective sterilization and followed for six months post vasectomy are the basis of this study. The patients were prospectively randomized into two groups: Group A - a total of 34 patients who underwent the open-ended cutaneous vasostomy and Group B - a total of 41 patients who underwent vasectomy by the conventional technique. The complications in each group were tabulated:

Group B (Ligature vasectomy)
Symptomatic sperm granuloma - 3 Spermatocele - 1 Epididymitis - 2 Hematohydrocele - 1

# C-7-81 (continued)

The purpose of this study was to decrease the sequelae from conventional vasectomy using the open-ended technique. Inspite of having a higher percentage of epididymitis (9%) in Group "A", as opposed to 5% in Group "B", there were no patients with symptomatic sperm granuloma in Group "A" as opposed to 7.5% incidence of symptomatic sperm granuloma in Group "B".

Objective: To determine if there is a difference in the therapeutic effectiveness of the Federal Standard 25% Normal Serum Albumin U.S.P. (which requires refrigeration with 10 year shelf life) and the commercially available 25% Normal Serum Albumin U.S.P. (which requires no refrigeration with 3 year shelf life).

Technical Approach: A clinical trial evaluating the clinical response of patients to the commercially available 25% normal serum albumin, non-refrigerated, to the Federal standard 25% normal serum albumin USP. The indications for use of the volume expanders was left up to the treating physicians. The clinical results of the commercially available albumin is compared with the response in patients during the past three years.

Progress: The study is just getting underway. Initial impressions are there appears to be no difference in the two sources of albumin.

Objective: To document the postoperative respiratory function and analgesia obtained in patients undergoing right subcostal approach for cholecystectomy given epidurally applied morphine (the test drug) as compared to Bupivicaine (a previously reported modality) or sterile saline (a placebo control).

Technical Approach: Patients undergoing cholecystectomy will be randomly assigned to receive either epidural morphine, bupivicaine or sterile saline. The anesthesia applied will be a single epidural injection of 10 ml of sterile test solution - either 5 mg preservative free morphine, 25 mg Bupivicaine, or sterile saline, followed by an inhalational -- relaxant (non-narcotic) oral endotracheal general anesthetic, an accepted balanced anesthestic for cholecystectomy. Postoperatively, the patients will be observed in the surgical recovery room for 24 hours post-injection, during which time the patient will be given all routine post-cholecystectomy medications and pain medication upon request. Patients will be encouraged to deep breathe, use the incentive spirometry and ambulate.

The data obtained will be evaluated as follows: Student t-test for duration of hospital stay, subtotal and total medication dosage, time to first ambulation and first meal, and spirogram analysis and non-parametric testing for pain report; chest x-ray; and surgical and nursing staff impression analysis.

Progress: This is a new study.

Objective: To determine if Academy of Health Science students who are documented as "Language and Learning Disabled Adults" (LLD), can be helpped to succeed in their Advanced Individual Training program thus reducing attrition and/or failure rates at the Academy of Health Sciences.

Technical Approach: All soldiers beginning AIT in the 91E Dental Specialist Course are administered a questionnaire pertaining to past educational experiences during their initial orientation class. Those identified with potential learning disabilities are referred to Occupational Therapy, BAMC, for more definitive evaluation. Should the SM seem to be learning disabled, he/she is then given a battery of tests which evaluate sensory integrative dysfunction, performance/potential levels, and clinical observation of perceptual and psycholinguistic skills. Remediation in the Occupational Therapy Learning Abilities Clinic is then provided for these soldiers diagnosed as true Learning Disabled (LD).

Progress: Since initiation of this study, 56 soldiers have been individually screened by Occupational Therapy for possible learning disabilities. Fifteen of those revealed some academic weakness but could not be directly attributed to a learning disability, but rather limited learning potential and/or language barriers. Sixteen were evaluated and diagnosed as learning disabled. Eleven of those sixteen were formally treated in Occupational Therapy.

A "Past Education Questionnaire" has been developed as a screening tool and is used regularly during each 91E orientation class. A commercially available evaluation tool, which is statistically significant for documenting LD, has been purchased and is currently being implemented into the evaluation process.

# C-11-81 (continued)

The course materials for the 91E Dental Specialist Course have been modified for the LD soldier who has difficulty reading: the technical manual is available on audio cassette; note taking has been significantly reduced; tests are given orally by the instructors or from audio cassette; visual aids (slides viewgraphs, etc.) have been reviewed and modified to reduce clutter, etc.

Inservice programs are being presented to the instructional staff of the Academy of Health Sciences pertaining to symptoms and treatment of the LD soldier. This inservice will become a routine presentation for all newly assigned AHS faculty during the Faculty Development Unit.

Further study is required, beyond the 91E course, to determine the number of LD soldiers who filter into the Academy of Health Sciences for Advanced Individual Training. These statistics are needed to help determine the need for an occupational therapist with SID/LD credentials on the Academy of Health Sciences TDA.

Objectives: system cons	To evaluate structed of Su	t <b>wo met</b> hods of rlyn <sup>R</sup> and ankle	ankle support: taping.	a semi-r	rigid support

To compare the effectiveness of these two methods in restricting successive active inversion.

Technical Approach: A comparison was made of the effectiveness of ankle taping utilizing the Gibney Basketweave and heel lock and a semi-rigid support constructed of Surlyn in restricting active inversion. Twenty-nine subjects had both methods applied concurrently such that one ankle was taped while the other was splinted. The first experimental group (14 subjects) was randomly selected to have the left nakle taped while the second experimental group (15 subjects) was randomly selected to have the left ankle splinted. Three measurements of maximum active inversion range of motion were taken on both ankles: (1) presupport, (2) pre-exercise, and (3) post-exercise. The subject's active inversion range of motion was measured with the Leighton-Flexometer.

Progress: A comparison of measurements taken pre-exercise and post-exercise for both taping and splinting resulted in no significant difference in retention of support as measured in available degrees of active inversion range of motion. The findings of this study indicate that both methods of support are comparably effective in restricting inversion range of motion throughout a specific level and amount of exercise.

members.

Technical Approach: Knee extension efforts were measured on the Cybex  $^{\rm R}$  II Dynamometer at 30, 180, and 240 $^{\rm O}$ /sec for 32 young adult subjects. At each of the three speeds, the highest peak torque was recorded for the left and right lower members.

Progress: Statistical application of a two-way analysis of variance with interaction showed no statistically significant difference in torque (p < .01) when comparing dominant versus non-dominant or left versus right lower members. In addition, the speed of limb movement did not have any effect upon the relationships studied.

Proj No: C-45-81 Status: 6 Nov 81 Completed Date: TITLE: Factors Precipitating Hamstring Strains in Track Athletes. Start Date: 2 Jul 81 Est Comp Date: Principal Investigator Facility William Bailey, 2LT, AMSC Academy of Health Sciences Associate Investigators: Dept/Sec: Physical Therapy Section William Bremiller, 2LT, AMSC Key Words: Hamstring strains

Track athletes

Objectives: To add to the existing knowledge of preventive sports medicine.

To assist supervisory personnel in planning training programs to avoid hamstring strains.

To predict the high risk individuals so that programs can be implemented to correct any deficiencies.

Technical Approach: A study of 95 high school track athletes was conducted to determine the most significant precipitators of hamstring injuries. The factors investigated included: bilateral hip joint flexibility, type of event, dominant leg, years of experience, age, sex, previous injury, and quadriceps:hamstring strength ratios as measured with a cable tensiometer.

Progress: Thirteen of the athletes sustained hamstring strains during the study. These 13 tended to be less flexible in the injured leg, were more experienced in track competition, and had a greater difference between quadriceps and hamstring strength in the injured leg. It was noted that 77% of all the injured athletes had sustained a previous injury to the injured leg. Certain events contributed to injury more than others, but age and sex showed no correlation to injury. Dominant leg correlated only in the hurdles.

Objectiv	ve: To eval	uate electrical skin	resistance r	atterns as	ar objective

Technical Approach: Electrical skin resistance measurements were made on both knees of thirty normal and eight postsurgical, knee surgery patients.

indicator of pain.

Progress: The results show no statistically significant difference (t=.6072, p=ns) between the mean electrical skin resistance values for points on the right versus the left knees of the normal subjects. There was a statistically significant difference (t=2.4763, p<.05) between the mean electrical skin resistance values for points on the involved versus the uninvolved knees of the postsurgical patients. This study indicates that the measurement of electrical skin resistance variations may represent an objective method for measuring pain.

Cost:	OMA Cost:	Review Results:
Objective: To quantita	te the capabilities	and limits of the Haemonetics Cell

SaverR blood processing system to remove bacterial contamination from blood for infusion.

To define the utility of the Haemonetics Cell Saver R system for auto-transfusion under conditions of severe penetrating trauma including battle-field injury for potential military utilization.

Technical Approach: The Haemonetics Cell Saver R blood recovery system was employed to process a mixture made to simulate enteric contamination of intraperitoneal blood in severe penetrating abdominal trauma.

Progress: With the exception of terminal ileal or colonic spillage where bacterial counts can exceed 100 billion colonies per ml, intraperitoneal blood in petrating abdominal trauma can be processed by the cell wash system for safe autotransfusion. Bacterial counts are less than 1000 colonies per ml to the level of the mid ileum and, along with bile, urine, fragments of bone and tissue, are effectively washed from the salvaged blood in logarithmic fashion. In these circumstances, use of autotransfusion of salvaged blood in penetrating trauma can be life saving, providing clean, fresh, and young autogenous red cells. However, until improvements in filtration and antibiotic augmentation can be demonstrated to eliminate the astronomical numbers of viable bacteria in even 0.1 ml of fresh stool, autotransfusion or processed fecal contaminated blood must be avoided, perhaps even in the most hereic of attempts.

Objectives:	To determine	the effective	reness	of the c	ombination	of MeCCNU +

To judge whether oral BCG adds to effectiveness.

5-FU as adjuvant chemotherapy.

Technical Approach: Patients with histologically proven Duke-C adenocarcinoma of the large bowel with no proven residua or metastatic disease and no prior chemotherapy or radiotherapy are eligible for entry into this protocol.

Treatment will conform with the schema outlined in the study protocol.

Progress: This study was recently closed. In two patients receiving chemotherapy plus BCG new primaries occurred at 26 months and 36 months. Total patient accrual was 620. Following the amendment to include a control arm, the recurrence rates were 36.5% (15/41) for the control arm, 30.5% (11/36) for chemotherapy and 31.2% (10/32) for chemotherapy and immunotherapy. Preamendment, the recurrence rate was 36.9% (52/141) for chemotherapy alone and 35.1% (42/134) for CT & IT.

Objectives: To determine	the efficacy o	f BHD	in preventing recurrence of	_

disease and prolonging survival of patients who have received desinitive surgical treatment for their primary lesions.

To determine the efficacy of BHD + BCG in preventing metastases and prolonging the disease-free interval.

To determine the immunocompetence of these patients.

Technical Approach: All patients with histologically confirmed diagnosis of malignant melanoma previously untreated with chemotherapy or radiotherapy, who are within four weeks of surgical excision of active disease, are eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: Two hundred and forty-one patients were entered on the study. Patients receiving chemotherapy alone (BHD) have a longer disease free interval (p = .09) and survival (p = .01) than patients receiving chemotherapy (BHD) plus BCG. Age continues to be the most isgnificant prognostic factor, with patients less than 40 years of age and 60 years of age and older doing betterh with chemotherapy alone, as are patients with 2 or more extremity primaries and those with the greatest depth of invasion.

In conclusion, the BHD is superior to BHD + BCG.

Cost:	OMA Cost:	Review Resu	lts:
Objectives: To compa	re the effectiveness	of chemotherap	y alone vs chemo-

Objectives: To compare the effectiveness of chemotherapy alone vs chemoimmunotherapy for remission induction in Stages III and IV ovarian and endometrial carcinoma.

To test the effectiveness of chemotherapy plus immunotherapy vs chemotherapy in maintaining complete remissions.

To test effectiveness of continued chemotherapy plus immunotherapy vs chemotherapy in inducing complete remission or maintaining partial remissions in patients with occult disease at restaging or in patients achieving only partial remission during 12 month induction therapy.

Technical Approach: Patients with histologically confirmed ovarian carcinoma or endometrial carcinoma Stage III or IV with no prior chemotherapy or concurrent progestational agent therapy are eligible. Adenocarcinoma of cervix and germ cell of the ovary are eligible.

Therapy will be according to the schema outlined in the study protocol.

Progress: There has been statistical evidence that the ovarian cancer patients treated with AC + BCG had higher complete response-rates and longer median survival durations than those treated with AC alone.

For evaluation purposes, Stage III and Stage IV endometrial carcinoma patients were analyzed separately. Although the number of evaluable patients was small, no difference was seen between patients in CR or PR. Treatment was noted to be well tolerated and no difference was observed in the survival rates, response rates or response durations. It was concluded that BCG showed no evidence of adding any benefit when combined with Adriamycin and Cyclophosphamide.

# SWOG 7524 (continued)

It was thought that the way each disease manifests itself could be a contributing factor as to why there was such a large difference in this regimen's effect on ovarian cancer (AC + BCG) as opposed to endometrial cancer.

Hormonal therapy			
Chemotherapy			
Accumulative MEDCASE	Est Accumulative	Periodic	
Cost:	OMA Cost:	Review Results:	

Objectives: To establish the survival of breast cancer patients when treating the first recurrence with a coordinated hormonal-chemotherapeutic approach.

To determine the efficacy of a response to the antiestrogen Tamoxifen in predicing response to ablative surgery.

To correlate hormonal manipulations with estrogen and progesterone receptors where possible.

Technical Approach: Only patients who have been surgically and/or radiotherapeutically treated with the intent to cure their primary disease are eligible. In addition, patients with castration are eligible.

Progress: ER+ patients have an overall response rate of 50%. Postmenopausal patients have progressively longer durations of response the longer postmenopausal. It appears that response to tamoxifen may predicate response to cophorectomy, as 4/15 postmenopausal patients who achieved CR or PR on tamoxifen achieved CR or PR with cophorectomy; 5/22 premenopausal patients achieved CR or PR with cophorectomy after failing tamoxifen, but 0/10 patients with CR or PR on tamoxifen responded to cophorectomy. While none of 21 patients achieved CR or PR with cophorectomy after failing to respond to tamoxifen, approximately 50% of all patients had prior adjuvant chemotherapy.

Objective: To compare the effectiveness of radiation therapy plus BCNU, radiation therapy plus DTIC, and radiation therapy plus Procarbazine for remission induction, duration of remission, and survival in patients with malignant gliomas of the brain.

Technical Approach: Patients with histologically confirmed primary central nervous tumors of the following histologic types are eligible: Astrocytoma, grades 3 and 4 (gliobastoma multiforme).

Therapy will follow the schema outlined in the study protocol.

Progress: There have been 198 evaluable patients entered on this study. The CR + PR rates in the BCNU, Procarbazine and DTIC limbs are 37%, 17% and 40%, respectively. Patients 50 years or older have a lower CR rate (15%) than those patients under the age of 50 (27%). There are no statistically significant differences in duration of CR or CR + PR for the three treatment arms. The difference in response rates between BCNU and DTIC is nearly statistically significant (p = .064, uncorrected).

Chemoimmunotherapy					
Non-Hodgkin's Lymphoma					
Accumulative MEDCASE	Est Accumulative	Periodic			
Cost:	OMA Cost:	Review Results:			

Objectives: To compare the effectiveness, in terms of rate of response of two chemoimmunotherapy regimens (CHOP + Levamisole vs CHOP + Levamisole + BCG) against CHOP for remission induction in previously untreated patients with non-Hodgkin's lymphoma.

For patients proven to be in complete remission after induction, to compare the duration of documented complete response obtained by continued maintenance immunotherapy with Levamisole vs no maintenance therapy.

For patients with impaired cardiac function (not eligible for treatment with Adriamycin), with mycosis fungoides, or with only a partial response to 11 courses of treatment with CHOP-Levamisole + BCG, to estimate the complete response rate obtained by continued chemoimmunotherapy with COP + Levamisole.

To estimate the CNS relapse rate in patients with diffuse lymphomas when CNS prophylaxis with intrathecal cytosine arabinoside is used.

To continue to evaluate the impact of systemic restaging of patients judged to be in complete remission and the value of expert hematopathology review of diagnostic material from all cases.

To establish baseline and serial data on immunologic status in both chemoimmunotherapy groups.

Technical Approach: The patient must have the diagnosis of non-Hodgkin's lymphoma established by biopsy.

Therapy will follow the schema outlined in the study protocol.

Progress: There are currently 729 patients registered on the Induction Phase SWOG 7713. Of these patients 208 have had a second registration onto SWOG 7714. The study will continue to accrue new patients for approximately six more months.

esults:		

Objectives: To determine in a randomized fashion the effectiveness of cis-diamminedichloroplatinum (DDP) given in the conventional low-doc schedule daily x 5 days versus high-dose intermittent treatment in remission induction of disseminated testicular cancer, when combined with vinblastine and bleomycin.

To determine the survival of patients who achieve a partial remission and are rendered disease-free by surgical removal of residual disease and maintained on the same chemotherapy as patients who achieved complete remission status on chemotherapy alone.

To determine the effectiveness of cyclophosphamide, actinomycin-D, adriamycin and vinblastine in the maintenance of remission status.

To document the nature and extent of the hemtologic and nonhematologic side effects of the various drug combinations.

Technical Approach: All patients with metastatic testicular cancer of germinal cell origin regardless of prior radiation therapy are eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: One-hundred-six eligible patients were entered with 94 being evaluable. The complete remission rate for the high-dose cis-platinum was 61%, and 44% for the low-dose. Seventy-one percent of patients receiving high-dose cis-platinum had no evidence of disease after cytoreductive surgery compared to 53% for the low-dose patients. Also, 90% of the patients on the high-dose arm are disease-free at one year compared to 65% in the low-dose arm.

Date: 22 Oct 81 Proj No: SWOG 7823/4/5/6 Status: Ongoing TITLE:

ROAP-AdOAP in Acute Leukemia

Start Date: FY 79		Est Comp Date: Unknown					
Principal Investigator		Facility Brooke Army medical Center Associate Investigators:					
J. Dean McCracken, M.D	., COL, MC						
Dept/Sec:							
Department of Medicine/Oncology Key Words: Chemotherapy		Richard A. Shildt, M.D., LTC, MC John D. Cowan, M.D., MAJ, MC					
					Immunotherapy		
					Adult acute leukemia		
Accumulative MEDCASE	Est Accumulative	Periodic					
Cost:	OMA Cost:	Review Results: Continue					

Objectives: To compare the efficacy of the 4-drug combination chemotherapy regimen, ROAP (Rubidazone, vincristine, arabinosyl cytosine, and prednisone) to AdOAP (the same combination using Adriamycin in place of Rubidazone) in adult acute leukemia, as determined by remission rate, remission duration and survival.

To determine the comparative toxicity of these regimens.

To determine whether late intensification therapy at 9 months after complete remission will improve long-term, disease-free survival.

To determine whether immunotherapy using levamisole for 6 months after months of complete remission on chemotherapy improves disease-free survival.

To determine the effects of intrathecal Ara-C on the incidence of  ${\tt CNS}$  leukemia.

To determine reproducibility of the FAB/histologic classification and correlation to response to therapy in 200 consecutive cases of acute leukemia.

To study the effects of intensive supportive care in the management of acute leukemia.

Technical Approach: All patients over 15 with a diagnosis of acute leukemia who have not received extensive therapy (defined as more than one course of any other chemotherapeutic agent or combination of agents) will be eligible for this study. The diagnosis of acute leukemia will be made on bone marrow smear, clot section and/or biopsy. An absolute infiltrate of 50% leukemic cells or greater is required.

Progress: At this time there appears to be no difference between rubidazone and adriamycin. In SWOG 7824, the number of patients is still too small to determine if CNS leukemia is being caused by multiple spinal taps. It is too early to draw any conclusions on either the SWOG 7825 or SWOG 7826 arms.

Receptor positive (ER+)				
Chemotherapy				
Accumulative MEDCASE	Est Accumulative	Periodic		
Cost:	OMA Cost:	Review Results: Continue		

Objectives: To compare the disease-free interval and recurrence rates in estrogen receptor positive (ER+) premenopausal patients with Stage II disease, using combination chemotherapy alone versus chemotherapy and oophorectomy.

To compare the disease-free interval and recurrence rates in estrogen receptor positive postmenopausal patients with Stage II disease, using combination chemotherapy plus tamoxifen versus tamoxifen alone versus combination chemotherapy alone.

To compare the disease-free interval and recurrence rates in all estrogen receptor negative (ER-) patients with Stage II disease using one versus two years of combination chemotherapy.

To compare the effect of these various adjunctive therapy programs upon the survival patterns of such patients.

To correlate the ER status with disease-free interval and survival.

Technical Approach: All patients must have had a radical or modified radical mastectomy with histologically proven breast cancer and with one or more pathologically proven axillary nodes. Primary neoplasm and clinically apparent axillary disease must be completely removed. Pretherapy studies must reveal no evidence of metastatic disease or involvement of the other breast. Patients with postoperative radiation therapy are eligible but will be randomized and evaluated separately. Therapy will follow the schema outlined in the protocol.

Progress: To date there are 326 patients registered on the study, of which 185 are available for analysis. There have been 7 relapses, all in the ER- group, and 4 deaths, 3 of which occurred in the ER- group. It is too early to make any comparisons between treatment groups at this time.

Key Words:		John D. Cowan, M.D., MAJ, MC		
Small-cell carcinoma				
Toxicity				
Accumulative MEDCASE	Est Accumulative	Periodic		
Cost:	OMA Cost:	Review Results:		

Objectives: To improve the complete response rate and long-term, disease-free survival of patients with extensive small-cell carcinoma of the lung.

To define, quantitate and quantify the toxicity of each regimen employed.

Technical Approach: There must be a diagnosis by the institutional pathologist of small-cell, undifferentiated carcinoma of the lung. Extensive small-cell carcinoma includes the following: 1) Any patient with evidence of metastatic spread beyond the hemithorax and supraclavicular nodes on either side; 2) Any patient with a cytology-positive pleural effusion; and 3) Any patient with prior radiation therapy to the primary tumor who presents with evidence of recurrent disease.

Patients meeting the above eligibility criteria will receive one of three treatment programs. Treatment program A consists of two standard drugs--Vincristine and Methotrexate. Treatment program B consists of Vincristine plus Adriamycin and Cyclophosphamide. Treatment program C consists of Vincristine, Adriamycin and Cytoxan plus VP-16. Therapy will follow the schema outlined in the study protocol.

Progress: The CR and PR response-rates among the three treatment arms were statistically identical; however, patients with a performance status of 0-1 had higher responses than those with a 2-4 performance status. A p value of .82 was observed in the survival rates of all treatment arms with a median survival of 30-31 weeks. Most importantly, reinduction patients had longer survival and longer time on study than maintenance patients.

Date: 5 Feb 81	Proj No:	SWOG 7830	Status:	Ongoing
TITLE: Carcinoembryonic				
Colorectal Cancer, a Rand	lomized, Prospe	ective Clinical	l Trial, Pha	se III.

Carcinoembryonic antigo	en			
Duke's B and C colorect	tal cancer			
Accumulative MEDCASE	Est Accumulative	Periodic		
Cost:	OMA Cost:	Review Results: Continue		

Objectives: To determine whether serial carcinoembryonic antigen (CEA) assays, following curative surgery, for Duke's B and C colorectal cancer leads to earlier detection of recurrence than standard follow-up procedures.

To determine whether recurrence detected through elevated CEA values, plus "standard clinical follow-up", leads to an improvement in the percentage of patients converted to no evidence of disease status following a second look surgery as opposed to recurrence detected by "standard" clinical means alone.

To determine whether there is a difference in crude survival between the CEA follow-up group and the standard follow-up group.

Technical Approach: To be eligible, the patient must have a completely resected Duke's B or C adenocarcinoma of the colon or rectum. Careful attention should be given to the examination of the liver. Suspicious areas should be biopsied to rule out metastatic disease. CEA values at 30 days post-initial resection myst be normal, i.e., nonsmokers < 2.5 ng/ml, smokers < 5.0 ng/ml. Patients may be entered on the basis of institutional CEAs done 4-6 weeks post-op with normal defined above.

Eligible patients will be placed in one of two follow-up plans. Plan A - Patients placed on this regimen will be closely monitored for the development of recurrent disease by means other than CEA with physical examinations, blood chemistry tests, nuclear medicine scans and x-rays at intervals from every two months to one year. Plan B is the same as Plan A with the exception that a CEA blood test will be done every two months for two years.

Progress: The surgical protocol for CEA as an indicator for second-look surgery was closed because of inadequate patient registration. It appeared biased, as the value of CEA is already too well established to perform such a study.

		•		
Lung cancer				
Accumulative MEDCASE	Est Accumulative	Periodic		
Cost: OMA Cost:		Review Results		

Objectives: To determine whether chlorozotocin has significant activity as determined by response rate and median duration of response, against small cell, large cell, adenocarcinoma or squamous carcinoma of the lung.

To observe for toxicities of chlorozotocin not yet described and better define the known toxicities.

To determine factors predisposing to excessive toxicity to this agent.

Technical Approach: To be eligible, the patient must have histologically proven lung cancer and must have measurable lesions. Patient must be off all prior anticancer treatment for at least three weeks and recovered from all acute toxicities of prior treatment.

The anticipated accrual rate to this study is 8-10 eligible patients/ month. At this rate it would be feasible to accrue the necessary 120 response-evaluable patients allowing for an overall inevaluability rate of 20-25%.

Therapy will follow the shcema outlined in the study protocol.

Progress: This study has been completed. A manuscript has been prepared and will be submitted to Cancer Treatment Reports for publication.

Date: Proj No: SWOG 7841 23 Oct 81 Status: Ongoing TITLE: Phase II-III Comparison of FAM vs FAM + Vincristine vs Chlorozotocin in the Treatment of Advanced Gastric Adenocarcinoma. Objectives: To determine response rate and remission duration with primary weekly intravenous therapy using MBGB in patients with advanced esophageal, breast, pancreatic, colorectal, and head and neck carcinomas and lymphoma.

To define the qualitative and quantitative toxicity of this regimen.

Technical Approach: Patients must have pathologically verified histologic diagnosis of cancer. MBGB is intended as initial chemotherapy for patients with inoperable or disseminated renal, esophageal, and pancreatic carcinoma. It is intended for use in patients with other forms of advanced malignancy (breast, head and neck, colorectal, lymphoma and multiple myeloma) if their disease has become progressive after initial chemotherapy and who are not candidates for SWOG studies of higher priority.

Therapy will follow the schema outlined in the study protocol.

Progress: This study was only recently opened to groupwide participation. No data are available at this time.

Objective: To help judge whether there is any therapeutic significance in humans to the laboratory observation that some colorectal tumors, in men and women, have estrogen receptors as determined by response rate to tamoxifen.

Technical Approach: Patients with biopsy confirmed diagnosis of adenocarcinoma of the large bowel are eligible.

Therapy will follow the schema outlined in the study protocol.

Progress: Tamoxifen's toxicity is virtually nonexistent. Median survival for these patients is 27 weeks. Survival curves for patients who have received prior chemotherapy versus those who have not, show an advantage for previously untreated patients (20 weeks versus 25 weeks). Patients entering the study with a performance status 0-1 showed a survival advantage over those entering with a performance status of 2 (34 weeks versus 13 weeks, respectively). Patients who underwent biopsy for ER determination had a considerably shorter survival time than those who did not (8 weeks versus 31 weeks, respectively).

Objectiv	e: To determine	the efficacy	of m-A	MSA at a	dose of 12	0 mg/M2 IV

Objective: To determine the efficacy of m-AMSA at a dose of 120 mg/M2 IV every three weeks in producing regressions or remissions in patients with hepatocellular, bile duct, and gallbladder carcinoma.

Technical Approach: All patients who have histologically confirmed hepato-cellular carcinoma, gallbladder carcinoma or bile duct carcinoma beyond hope of surgical cure are eligible. There must be histologic proof of residual, recurrent or metastatic carcinoma. Patients must have measurable disease and a life expectancy of at least 4 weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: To date there are 23 hepatoma, 10 gallbladder and 8 bile duct patients entered on study. This study remains open for gallbladder and bile duct only. Responses to date: hepatoma 2 PR' and 2 improvements; gallbladder - 1 PR and 1 improvement; and bile duct - 1 PR.

Objecti	ives: To determi	ne response rate	and re	mission duration '	with meekta	

Objectives: To determine response rate and remission duration with weekly intravenous therapy using MGBG in patients with carcinoma of the breast who have failed on higher priority treatment protocols.

To define the qualitative and quantitative toxicity of this regimen.

Technical Approach: All patients not eligible for higher priority SWOG studies with histologically proven, incurable, advanced, metastatic carcinoma of the breast are eligible. Patients must have clearly measurable disease and a life expectancy of at least six weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: There were 54 patients evaluable for response, all had received prior extensive chemo- or hormonal therapy. There was 1 CR documented at autopsy; 1 improvement and 10 patients with stable disease lasting a median of 6 weeks.

Date: 23 Oct 81	Proj No: SWC	G 7922 Status: Ongoing

Obtachtungs To determi	no the reconnec mete	to the combination observable		

Objectives: To determine the response rate to the combination chemotherapy of CAP vs m-AMSA in patients with advanced transitional cell carcinoma of the urinary bladder not amenable by surgical resection and/or radiotherapy, who have good renal function.

To determine the response rate to CAP vs m-AMSA after failure or progression on either arm upon crossover to the alternate treatment arm.

Technical Approach: Patients with histologic diagnosis of transitional cell carcinoma of the urinary bladder, Stage IV, or patients who have failed on previous surgery and/or radiotherapy are eligible. Patients must have measurable disease and a life expectancy of at least 8 weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: There have been 21 patients entered. The majority are too early to evaluate. Of the 9 evaluable patients, there have been 2/4 responses to m-AMSA and 3/5 to the combination treatment.

Objectives: To determine the efficacy as determined by response rate of Gallium Nitrate in patients with metastatic squamous cell carcinoma and/or local recurrent squamous cell carcinoma of the head and neck who have failed on higher priority treatment protocols.

To determine if Gallium scan results may be predictive of anti-tumor effect.

Technical Approach: All patients not eligible for higher priority SWOG protocols with histologically proven, incurable, advanced, metastatic squamous cell carcinoma or local recurrent squamous cell carcinoma of the head and neck are eligible. Patients must have clearly observable and/or measurable disease and a life expectancy of at least 6 weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: Eighteen patients have been registered thus far, with 9 fully or partially evaluable patients, 7 too early to evaluate and 1 patient not evaluable. Thus far there have been no responses seen.

Objectives: To determin	e the efficacy	of sea	uential	ly alternat	ing mutally

Objectives: To determine the efficacy of sequentially alternating mutally noncross-resistant, multidrug regimens in remission induction and intensification therapy in patients with limited small cell lung cancer.

To determine the value of chest radiotherapy added to intensive systemic chemotherapy in reducing chest recurrences and in improvement of survival.

To determine the relative efficacy and toxicity of low-dose, extensive chest radiation when used in close chronologic sequence with systemic multiagent chemotherapeutic regimens.

To determine whether radiotherapy ports should be set according to tumor size prior to or after induction chemotherapy.

To determine the value of combined systemic chemotherapy and radiotherapy in the control of bulky chest disease.

Technical Approach: Patients with histologically or cytologically proven small cell carcinoma of the lung will be eligible for this study. All patients must have so-called "limited disease".

Therapy will follow the schema outlined in the study protocol.

Progress: In 94 evaluable patients treated with chemotherapy alone, 35% have achieved CR, 47% PR, with an overall response rate of 82%. Sex, performance status and tumor size seem to have no effect on remission durations. At this time the median survival is 53 weeks; however, it is still early.

To determine the nature and degree of toxicity of this drug.

Technical Approach: All patients not eligible for higher priority SWOG studies with histologically proven, incurable, advanced, metastatic carcinoma will be eligible. Patients must have clearly measurable disease and a life expectancy of at least 6 weeks.

Therapy will follow the schema outlined in the study protocol

Progress: Only five patients have been entered; all are too early to evaluate.

SWOG 7940/1/3 Status: Date: 26 Oct 81 Proj No: Ongoing TITLE: Evaluation of 5-FU vs a Phase II Drug in Metastatic Adenocarcinoma of the Large Bowel, Phase II-III. FY 80 Start Date: Est Comp Date: Unknown Principal Investigator Facility J. Dean McCracken, M.D., COL, MC Brooke Army Medical Center Dept/Sec: Associate Investigators: Department of Medicine/Oncology Richard A. Shildt, M.D., LTC, MC John D. Cowan, M.D., MAJ, MC Key Words: Metastatic adenocarcinoma of large bowel MGBG Gallium Nitrate DHAD Accumulative MEDCASE Periodic Est Accumulative Review Results: Cost: OMA Cost: Objectives: To determine the relative activity of a phase II drug (MGBG

SWOG 7941, Gallium Nitrate SWOG 7943, DHAD SWOG 7944) in previously untreated patients with disseminated colon and rectal cancer.

To compare the survival of patients with disseminated colon cancer receiving a Phase II agent (MGBG/Gallium Nitrate/DHAD) as first therapy to the survival of patients receiving fluorinated pyrimidine 5-Fluorouracil (5-FU) therapy first.

To determine the effect of a previously administered Phase II drug on the response rate seen with 5-FU in patients with disseminated colon and rectal cancer.

Technical Approach: Eligible patients must have biopsy proven adenocarcinoma arising from the colon or rectum. Patients must have clinically measurable recurrent or disseminated disease to qualify for the study. Obstructive lesions in the colon and rectum must have been bypassed or adequately maintained by decompression measures. Patients must have a life expectancy of at least 10 weeks.

Therapy will follow the schema outlined in the study protocol.

Progress: There have been no responses to date on the 5-FU arm. There is no significant difference between 5-FU and MGBG between good and poor risk, male and female. In both arms there was a significant difference between performance status groups 0-1 versus 2, with a median survival of 25 versus 18 weeks respectively. Twenty-five patients have been placed on the DHAD arm, 4 have crossed-over to 5-FU; toxicity has been minimal.

administered on a once weekly l					

To determine the response rate (standard error  $\pm$  10%) to weekly, intravenous cholchicine in each of the tumor types tested.

To determine quantitative and qualitative toxicity of the drug on this schedule.

Technical Approach: Patients with chronic lymphocytic leukemia, Hodgkin's disease, breast and lung cancer (both small and non-small cell) are potential candidates for this study after they have developed progressive disease on SWOG protocols of higher priority. They must have a life expectancy of at least 6 weeks and a Performance Status of 0-3. Measurable disease is desirable but not required.

It is estimated that 30 patients in each category will need to be entered in order to have 25 patients which are response-evaluable.

Therapy will follow the schema outlined in the study protocol.

Progress: A good response to colchicine has been noted in small cell lung cancer.

Date: 27 Oct 81	Proj No: SWC	G 7963 Status: Ongoing		
TITLE:				
m-AMSA in Melanoma	a, Myeloma, Lymphoma,	Oat Cell Lung and Breast		
Carcinomas				
Start Date: 11 May 8	31	Est Comp Date: Unknown		
Principal Investigator		Facility		
J. Dean McCracken, M.D.	, COL, MC	Brooke Army Medical Center

m-AMSA				
Accumulative MEDCASE	Est Accumulative	Periodic		
Cost:	OMA Cost:	Review Results: Continue		
Objectives: To determi	ne the efficacy of m	-AMSA at a dose of 120 mg/M <sup>2</sup> IV		
every 3 weeks in produc	ing regressions or r	emission in metastatic melanoma,		
lymphoma, myeloma, meta	istatic oat cell lung	carcinoma, and metastatic breast		

To determine the effect of m-AMSA on survival of patients with metastatic melanoma, lymphoma, myeloma, metastatic oat cell carcinoma of the lung, and metastatic breast cancer, which are resistant to standard chemotherapies.

cancer, which are resistant to standard chemotherapies.

To correlate in vitro m-AMSA sensitivities in the tumor stem cell colony drug system and in vivo m-AMSA activity in prtients with metastatic melanoma, lymphoma, myeloma, metastatic out cell carcinoma of the lung and metastatic by set cancer, all of which are resistant to standard chemotherapies.

Technical Approach: Patients must have histologically confirmed melanoma, myeloma, breast carcinoma, lymphoma or oat cell carcinoma of the lung, refractory to standard therapies. Patients must have measurable disease and a life expectancy of six weeks.

Therapy will follow the scheme outlined in the study protocol.

Progress: There were 65 breast patients entered in this broad Phase II pilot; of these, 30 are presently response evaluable resulting in 3 PR's and 5 disease improvements.

Minimal response has been seen in out cell carcinoma with 12 patients having progression of disease and 2 with an improvement in disease status.

Thirteen evaluable melanoma patients have been entered on this study, all having been pre-treated. One PR has been reported, and 1 patient had less than a partial response, giving this agent a 5-10% response rate. Of these pre-treated patients, 10% are sensitive in vitro to m-AMSA, while a 26% sensitivity rate has been reported in patients who have not received prior chemotherapy.

SWOG 7963 (continued)

To date there are 7 evaluable patients. More data will be required before any conclusions can be made.

The study has been closed to lymphoma and breast cancer patients.

Accumulative MEDCASE	Est Accumulative	Periodic		
Cost:	OMA Cost:	Review Results: Continue		

Objectives: To compare the disease-free survival and overall survival for surgery alone (with chemotherapy for relapsers) vs surgery plus early adjuvant chemotherapy in patients with resectable Stage II testicular cancer.

To register and follow patients with non-seminoma, non-choriocarcinoma stage I testicular cancer, to define prognostic variables which may predict recurrence in this stage group.

To define the difference in disease-free rates and patterns of recurrence based upon histologic subtypes and extent of disease on initial presentation.

To evaluate the role of marker substances such as human chorionic gonadotropin, alpha-fetoprotein and lactic dehydrogenase in the early detection and management of recurrences in patients with stage I and stage II testicular carcinoma.

To evaluate the accuracy of lymphangiogram, CAT scans and ultrasound studies for staging of retroperitoneal nodal involvement.

Technical Approach: Patients with histologically confirmed carcinoma of the testis, stage I or stage II, are eligible. Patients should enter the study between two and four weeks after lymphadenectomy.

Therapy will follow the schema outlined in the study protocol.

Progress: The Southwest Oncology Group has entered 8 patients in this intergroup study. Insufficient data have been collected for reporting purposes.

Date: 26 Oct 81	Proj No:	SWOO	3 8001	Status:	Ongoing

Acute lymphoblastic leuke	mia	l			
Accumulative MEDCASE	Est Accumulati	ve	Period	lic	
Cost:	OMA Cost:		Review	Results:	Continue
Objective: To evaluate t	he effectivene	ss as	detern	ined by the	complete remis-

sion rate of the L10 protocol using Vincristine, Prednisone and Adriamycin for induction, followed by intensive consolidation in the treatment of acute ALL.

To compare the effect on remission duration and survival of two maintenance regimens: the L10 "eradication" regimen vs cyclic therapy with POMP-COAP-GPAL.

To determine the reproducibility of the FAB histologic classification and correlation to response to therapy of ALL in adults.

Technical Approach: Patients are cligible with the diagnosis of acute lymphobic deleukemia who satisfy the following criteria: A) Absolute infiltration of the marrow with >50% blasts; b) Absolute infiltration is defined as the rotal blast cell percentage (%) multiplied by the bone marrow cellularity presentage divided by 100; B) If the absolute infiltrate is 30-49%, evidence or progressive disease prior to entering the study will be required.

Thorapy will follow the schema outlined in the study protocol.

respress: Twelve patients have been entered, and it is too early for a comrehensive analysis. However, on patients with adequate data, there have seen 8/9 complete responses. Because of poor patient accrual, it was decided to stop the randomization on the maintenance phase. Therefore Arm 1, the POMP-COAP-OPAL therapy will be closed and all patients will now receive the L10 cyclic therapy.

To evaluate the relative toxicities of these respective regimens.

To assess the feasibility and reliance of applying "measurable versus evaluable" criteria of tumor regression in determining therapeutical response.

To correlate tumor grade with response and survival.

Technical Approach: Eligible patients are those with "extensive" squamous cell (epidermoid) lung carcinoma defined as "spread beyond the hemithorax and ipsilateral scalene, supraclavicular and mediastinal lymph nodes", equivalent with TNM system Stage III class M<sub>1</sub> with any T or N other than mediastinal, supraclavicular scalene nodes involved. Relapsing or recurrent TNM Stage I or II patients, failing after radiation therapy alone to the primary site of involvement are also eligible for study.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study, and it is too early to give an evaluation at this time.

28 Oct 81 Date: SWOG 8017 Prof No: Status: Ongoing TITLE: 5-FU, Adriamycin, Streptozotocin and Cyclophosphamide (FAC-S) in the Treatment of Metastatic Carcinoid Tumors, Phase II Est Comp Date: Unknown Start Date: Nov 80 Facility Principal Investigator J. Dean McCracken, M.D., COL, MC Brooke Army Medical Center Dept/Sec: Associate Investigators: Richard A. Shildt, M.D., LTC, MC Department of Medicine/Oncology Key Words: John D. Cowan, M.D., MAJ, MC Carcinoid Accumulative MEDCASE Est Accumulative Periodic Review Results: Continue Cost: OMA Cost: Objectives: To determine whether combination chemotherapy employing 5-FU,

Cyclophosphamide, Adriamycin and Streptozotocin is effective in the management of metastatic carcinoid.

To study the duration of survival of patients with metastatic carcinoid tumor treated with combination chemotherapy regimens.

To provide further information concerning the response and/or survival of patients with metastatic carcinoid originating in different sites and baving different metastatic patterns.

The sical Approach: All patients must have biopsy-proven carcinoid tumor not amount to further surgical therapy with no prior chemotherapy. A minimum life expectance of 6 weeks and a performance status of 3 or better per Southwest Oncology Group criteria is necessary. All patients must have objectively measurable disease either as a measurable lesion or significant biochemical obnormality specific for their tumor.

Therapy will follow the schema outlined in the study protocol.

Progress: This is a new study.

Objective: To determine if adjuvant chemotherapy will improve the cure rate in uterine sarcomas, Stage I and II.

Approach: Parients with histologically proven sarcomas of the uterine corpus will be considered if they have Stage I or Stage II disease clinically, and if they have no known gross residual disease following surgery. Preoperative or postoperative pelvic radiotherapy may be given at the discretion of the proceeding investigator, but a decision about this mode of therapy must be made palor to the chemotherapy randomization.

therapy will follow the schema outlined in the study protocol.

Progress: There is no significant difference in survival and progression-free interval between the two programs. Moreover, Montel-Haentzel techniques adjusting for such parameters as stage, histology, prior radiotherapy and various combinations of these three have been employed, revealing no treatment difference.

Objective: To determine the efficacy of a	

Objective: To determine the efficacy of adjuvant nonspecific immunotherapy to standard alkylating agent therapy in patients with Stage III optimal carcinoma of the ovary.

Technical Approach: Patients in "optimal" category (3 cm or less greatest diameter of residual tumor(s) with proven primary Stage III epithelial cancer of the ovary) who have undergone tumor-reductive surgey will be included in the study.

Therapy will follow the schema outlined in the study protocol.

Progress: There is no significant difference when the duragion of progression-free interval and survival are compared by therapy. When progress-free interval and survival are compared by size of residual tumor at surgery, both are highly statistically significant. However, it is too early to draw any conclusions.

_	Cost:	Revi	ew Results:		

Objective: This protocol constitutes a Phase II design outlining the procedures that will be performed to screen for activity of new agents or drug combinations in patients with advanced recurrent pelvic malignancies. Its intent is to determine the efficacy of chemotherapeutic agents in patients whose advanced malignancies have been resistant to high priority methods of treatment.

Technical Approach: This is a study of multiple chemotherapeutic agents. Therapy will follow the schema outlined in the study protocol. Agents to be used in this study include: Piperazinedione, Cis-platinum, VP-16, Galacticol, Baker's Antifol, ICRF-159, Maytansine, m-AMSA and Yoshi 864.

Progress: Cis-platinum has marked activity as first line chemotherapy of squamous cell carcinoma of the cervix and is active as second line therapy of advanced ovarian carcinoma at the dose and schedule tested. The drugs appears to be inactive against endometrial carcinoma but may have limited activity in the therapy of sarcomas and cervical adenocarcinomas.

Because of the demonstrated activity of Cis-platinum in squamous cell carcinoma of the cervix, a phase III study comparing three different regimens of Cis-platinum in advanced squamous cell carcinoma of the cervix was activated as GOG 43.

GOG 26 (continued)

Because of the demonstrated activity of Cis-platinum in epithelial ovarian carcinoma, protocol GOG 47 was activated comparing Adrimycin plus Cyclophosphamide plus Cis-platinum with Adriamycin plus Cyclophosphamide.

VP-16 - VP-16 appears to have minimal activity against ovarian adenocarcinoma and insignificant activity against squamous cell carcinoma of the cervix at the dose and schedule tested.

Galacticol - Complete and partial remissions in carcinoma of the cervix have been 19% which is encouraging enough for future studies, possibly in combination with other drugs. One complete remission continues at 33+ months.

Complete and partial remissions in carcinoma of the ovary were 15%. Almost all of these patients had received prior chemotherapy. One complete remission continues at 24+ months; the other relapsed 15 months after entry.

Baker's Antifol - Although limited activity is noted, this drug is not as useful as more conventional drugs and probably will not add to current therapeutic regimens.

IRCF - IRCF appears to have moderate activity in squamous cell carcinoma of the cervix at the dose and schedule tested despite induction of significant myelosuppression. Results of this study will be used to determine the future role, if any, of ICRF-159 in the treatment of gynecologic cancer either alone or in combination with other drugs.

AMSA and YOSHI - It is too early to evaluate the results. When these are obtained, they will be used to determine the future role, if any of AMSA and YOSHI in the treatment of gynecologic cancer either alone or in combination with other drugs.

To determine the patterns of relapse for each form of therapy.

To establish the value of various staging parameters on the stage of disease and its natural history.

Technical Approach: All eligible patients must have a histopathologic diagnosis of common epithelial ovarian cancer of one of the following types: serous, mucinous, and those listed in Appendix I of the protocol. After definitive staging procedure, if the patient is a selective Stage IAi, or IBi, and the histologic grade is well or moderately differentiated, the patient is eligible.

Therapy will follow the schema outlined in the study protocol.

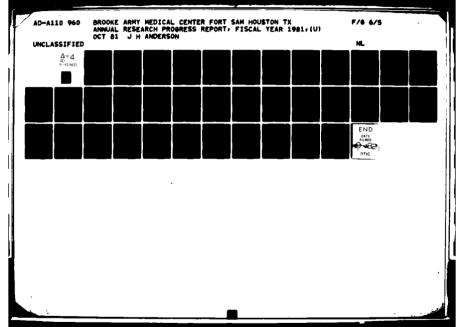

Progress: No reportable data are available.

Cost:	OMA Cost:	Review Results:
Objective: To determin	e whether phlebotomy	in conjunction with antiaggre-

Objective: To determine whether phlebotomy in conjunction with antiaggregating agents can decrease the frequency of thrombotic complications in patients with PV to the level in patients treated with 32P.

Technical Approach: Only those patients who have well-documented, active polycythemia vera, as demonstrated by rigorous diagnostic studies designed to eliminate spurious (stress) polycythemia, anoxic erythrocytosis, or erythrocytosis secondary to increased erythropoietin, or erythrocytosis without additional evidence of myeloproliferative disease either past or present, will be eligible for this study.

Therapy will follow the schema outlined in the study protocol.

Propress: At the Group meeting, March 1981, it was reported that there were 7 thrombotic events in the aspirin/Persantine arm as compared to 2 thrombotic events in the 32-P arm. The one year major thrombotic complication rate on the philebotomy arm of the study was 8% in comparison to 8.4% on the aspirin/Persantine arm. At the end of two years the major thrombotic incidence rate was equal, being approximately 12%. However, there had been a major increase in the incidence of hemorrhagic events in the aspirin/Persantine arm (6 vs 0). Accordingly, it was recommended that this protocol be closed to patient accrual and that those patients on the aspirin/Persantine arm be treated with phlebotomy alone at the discretion of the individual investigator.

Cost: OMA Cost	

Objective: To evaluate the efficacy of HU in patients of all ages with polycythemia vera who have active disease and to assess the influence of HU upon the symptoms and signs of active disease and upon the abnormal hematological and biochemical manifestations of the panmyelosis that characterize this condition.

Technical Approach: Only those patients who have well-documented, active polycythemia vera, as demonstrated by rigorous diagnostic studies designed to eliminate spurious (stress) polycythemia, anoxic erythrocytosis, or erythrocytosis secondary to increased erythropoietin, or erythrocytosis without additional evidence of myeloproliferative disease either past or present, will be eligible for this study.

Therapy will follow the schema outlined in the study protocol.

Progress: Initial response was evaluated in 88 patients entered in the group-wide study. Two patients who were previously untreated and four patients who were treated had no response to this drug. Of 40 previously untreated patients who had an initial response, response occurred from 5 days to 105 days after therapy was started with a median of 17 days. For the 42 previously treated patients who had initial response, response occurred from 6 days to 130 days with a median of 14.5 days.

The study was closed to patient entry; however, all patients now on hydroxyurea will continue to be followed.

#### ACKNOWLEDGEMENT

We regretted the departure of former BAMC Commander Brigadier General Andre J. Ognibene and wish him every success in his new endeavors. We are enthusiastic about the future with Brigadier General Tracy E. Strevey, Jr., the new Commanding General of BAMC.

In every organization there are those who never receive the recognition they deserve. Mrs. Bodie Bratten, the Editorial Assistant, and SFC Chuck Loyd, the NCOIC, have continually given that extra effort that has assured the success of the Department of Clinical Investigation for which I am most appreciative.

AMES H. ANDERSON, JR., M.D.

Major, MC

Chief, Department of Clinical Investigation
