I. INTRODUCTION

In the 24th annual statistical survey of current model vehicles conducted by the Coordinating Research Council, Inc., test data were obtained on 429 1980 model vehicles including 6 select models of special interest. Maximum octane number requirements under full- and part-throttle operating conditions were determined, and surface ignition knock and rumble, if present, were also reported.

Passenger cars and light-duty trucks including non-commercial vans (1/2 - 3/4 ton without four-wheel drive) were tested according to a weighted distribution. This year's survey includes analyses for the following vehicle categories:

- (1) U.S. and Imported Vehicles -- 429 vehicles;
- (2) U.S. and Imported Cars -- 407 cars.
- (3) U.S. Vehicles -- 344 vehicles.
- (4) U.S. Cars -- 326 cars.
- (5) Imported Vehicles -- 85 vehicles.

It should be noted that the term "cars" designates passenger cars only, while the term "vehicles" includes passenger cars plus vans and light-duty trucks.

The order of testing reference fuels was the same as the 1979 Survey, which is as follows:

Tank Fuel	1st
High Sensitivity Full-Boiling Range Unleaded (FBRSU) Fuels	2nd
Average Sensitivity Full-Boiling Range Unleaded (FBRU) Fuels	3rd
Primary Reference (PR) Fuels	4th

Seventeen laboratories participated in this survey and submitted data on U.S. vehicles; fourteen of these labs also reported data on imported models. Participating laboratories are listed in Appendix A. Members of the CRC-Analysis Panel are identified in Appendix B.

II. SUMMARY

A. Vehicles Tested

Data were collected on 441 1980 model vehicles; however, analysis in this report was based on 429 vehicles. Data for 12 vehicles were excluded because of low odometer mileage. The 429 vehicles included 344 U.S. vehicles

and 85 imported vehicles. There were 326 U.S. passenger cars and 81 imported cars. There were 18 U.S. and 4 imported light-duty trucks and vans. The 1980 Survey included 388 vehicles tested in proportion to estimated production volume, plus 41 additional cars tested to provide larger samples of select models. The vehicles used in this program had an average of 11,253 deposit miles. The production-weighted engine displacement and compression ratio were 3.23 L and 8.40, respectively.

B. Octane Number Requirements

Requirements are expressed as the Research octane number (RON), Motor octane number (MON), and (R+M)/2 octane number of the reference fuel which produced the least audible knock due to either spark or surface ignition, whichever was limiting. Estimated octane number requirements for the U.S. vehicles are weighted in proportion to the 1980 vehicle model production figures and, for the imported models, in proportion to import sales volume in the U.S.

Maximum and part-throttle octane number requirements at the 50% and 90% satisfaction levels for the sample of 1980 U.S. and Imported Vehicles, U.S. and Imported Cars, U.S. Vehicles, U.S. Cars, and Imported Vehicles are given in Table I. A summary of the Research and Motor octane number requirements for FBRU fuels only is shown below:

FBRU Octane Number Requirements

1980 and Changes From 1979

	<u>Research</u> <u>Octane No.</u>		<u>Motor</u> <u>Octane No.</u>	
	<u>50%</u> <u>Sat.</u>	<u>90%</u> <u>Sat.</u>	<u>50%</u> <u>Sat.</u>	<u>90%</u> <u>Sat.</u>
<u>WEIGHTED POPULATION</u>				
<u>Maximum Octane Number Requirements</u>				
All U.S. and Imported Vehicles	90.8	95.1	83.5	86.2
Δ from 1979*	-0.9	-1.9	0.9	-0.2
All U.S. and Imported Cars	90.6	95.1	83.4	86.2
Δ from 1979*	-1.1	-1.8	0.8	-0.2
All U.S. Vehicles	91.4	95.5	83.8	86.4
Δ from 1979*	-0.9	-1.9	0.8	-0.3
All U.S. Cars	91.3	95.5	83.8	86.4
Δ from 1979*	-1.2	-1.9	0.7	-0.3
Imported Vehicles	89.0	92.6	82.3	84.6
Δ from 1979*	0.1	-1.3	1.2	0.5

* The 1980 FBRU fuels over the RON range were 0.3 to 1.4 units lower in sensitivity than the 1979 FBRU fuels.

FBRU Octane Number Requirements

1980 and Changes From 1979

Imported Vehicles	85.7	91.6	80.2	83.9
Δ from 1979*	+3.5	-2.3	+3.0	-0.2

Maximum octane requirements for the select models at the 50% and 90% satisfaction levels for PR, FBRU, and FBRSU fuels are shown in Table II, and summarized below for FBRU fuels only.

Select Models

Maximum FBRU Octane Number Requirements

<u>Select Model</u>	<u>No. Tested</u>	<u>Research Octane No.</u>		<u>Motor Octane No.</u>	
		<u>50% Sat.</u>	<u>90% Sat.</u>	<u>50% Sat.</u>	<u>90% Sat.</u>
NC5 225/HC5 225					
IC5 225/LC5 225	24	91.1	95.9	83.6	86.7
NC7 228/HC7 228					
IC7 228/LC7 228	21	86.2	90.5	80.4	83.3
NIJ 244	12	92.1	94.1	84.3	85.5
OCA 242/MCA 242	14	91.9	93.9	84.1	85.4
O V250/M V250	14	92.3	95.4	84.4	86.3
PC 137/KC 137/DC 137	15	93.8	98.2	85.4	88.3

* See footnote, page 2.

C. Maximum Octane Number Requirements at Part-Throttle

Incidence of part-throttle knock with FBRU being equal to or greater than full-throttle knock was about the same in 1980 as it was in 1979. Maximum requirements occurred at part-throttle in 14.5% of all 1980 model vehicles with FBRU fuels, compared with 15.9% in 1979.

D. Tank Fuel Knock Reported by Trained Observer

In the 1980 Survey, 49.9% of the weighted vehicle population was found to knock on tank fuel, compared with 47% in the 1979 Survey. Note that these values reflect a combination of both vehicle octane requirements and the customer's choice of octane quality of the gasoline used in the vehicle.

E. After-Run on Tank Fuel

Out of 404 vehicles tested by trained observers, there were 10 reported incidents of after-run on tank fuel. Note that trained observers' reports are based on a single data point made on the fuel in the test vehicle tank with spark timing at manufacturer's recommended setting. Owners reported a higher percentage of after-run (11.5% vs 2.5%).

F. Surface Ignition and Rumble

There was one car in the 1980 Survey reported with both surface ignition and spark knock; none had rumble.

G. Road Octane Number Depreciation

Road octane number depreciation of FBRU fuels in the range 86 to 100 RON varied from 1.4 to 4.2, compared with 1.2 to 5.5 in the 1979 Survey. Depreciation of FBRSU fuels in the range of 87 to 101 RON varied from 2.7 to 4.9, compared with 2.2 to 6.0 last year.

III. TEST VEHICLES

A total of 429 1980 model vehicles was tested in this year's survey. Non-commercial vans and light-duty trucks (1/2 - 3/4 ton without four-wheel drive) were included as part of the total vehicle population. Of the 429 vehicles tested, there were 326 U.S. and 81 imported cars plus 18 U.S. and 4 imported vans and light-duty trucks. There are an additional 12 vehicles with less than 4000 odometer miles which were not included in the analyses; however, the test data for these cars are listed in Appendix E with observation numbers 800 to 811.

To provide a statistical sample of vehicles on the road, 388 vehicles were tested in proportion to their percentage of total vehicle production, and 41 additional cars were tested to provide a larger sample of each of 6 select models of special interest, all of which had automatic transmissions. Specifications for the select models are shown in Table III.

In the 1980 Survey, 77% of the vehicles were equipped with automatic transmissions, and 70% were equipped with air conditioners. The vehicles used in this program had an average of 11,253 deposit miles. Table IV shows the distribution of odometer mileage for vehicles tested in both the 1980 and 1979 Surveys. The 1980 distribution is also shown as a bar chart in Figure 1. The weighted engine displacement for the 1980 fleet was 3.23 L; the weighted compression ratio was 8.40.

Participants were assigned specific vehicle models in a pattern which minimized data bias due to differences in testing and vehicle sampling. The United States was divided into four geographical areas, and assignments for vehicles of a given model were divided among laboratories within each geographical area. The basic timing was adjusted to the manufacturers' recommended setting prior to test. A total of 100 vehicles was adjusted. Thirty-five vehicles were more than $\pm 2^\circ$ from the manufacturer's specification when received, compared with 67 in the 1979 Survey. Number of vehicles and the degrees advanced or retarded are shown in Table V.

IV. REFERENCE FUELS

Average laboratory octane number ratings and blending data for the FBRU and FBRSU fuels are shown in Tables D-I and D-II of Appendix D. Sensitivities of the 1980 full-boiling range reference fuels are summarized in Table D-III, and a comparison of sensitivities of 1980 and 1979 fuels is shown in Table D-IV. The 1980 FBRU fuels over the RON range were 0.3 to 1.4 octane numbers lower in sensitivity and were 6.3% to 24.8% lower in aromatic content than the 1979 fuels. The FBRSU fuels were 0.8 higher to 0.4 lower in sensitivity. Inspection data furnished by the fuel supplier are shown in Table D-V.

A. Primary Reference (PR) Fuel

Isooctane and normal heptane, meeting ASTM specifications, were blended in two octane number increments from 76 to 82 RON, and in one octane number increments from 82 to 100 RON.

B. Average Sensitivity Full-Boiling Range Unleaded (FBRU) Reference Fuels

FBRU fuels were prepared from three base blends (RMFD-326-80, RMFD-327-80, and RMFD-328-80) in two octane number increments from 78 to 84 RON, and in one octane number increments from 84 to 101 RON.

C. High Sensitivity Full-Boiling Range
Unleaded (FBRSU) Reference Fuels

FBRSU fuels were prepared from three base blends (RMFD-329-80, RMFD-330-80, and RMFD-331-80) in two octane number increments from 78 to 84 RON, and in one octane number increments from 84 to 101 RON.

V. TEST TECHNIQUE

The test technique (CRC Designation E-15-80) specified that octane number requirements be determined at level road acceleration conditions. The order of fuel testing was Tank Fuel, FBRSU, FBRU, and PR fuels. Knocking tendency was investigated at both maximum throttle and part-throttle to determine the most critical condition. The occurrence of other abnormal combustion noise, such as surface ignition knock and rumble, was also reported.

The octane number requirement of a vehicle is defined as the Research or Motor octane number of the highest octane test fuel which produces borderline knock due either to spark or surface ignition, whichever is limiting. The maximum octane number requirement of the vehicle is defined as the highest of these requirements, whether at full- or part-throttle. Maximum octane number requirements were obtained over the speed range with PR fuel only. In addition, maximum part-throttle requirements were determined with FBRU fuels down to the limit of the lowest available fuel.

VI. DISCUSSION OF RESULTS

A. General

Of the 17 participating laboratories, 3 used level roads, 13 used chassis dynamometers, and 1 used both. Weather conditions under which tests were conducted varied considerably among participants. On the average, the barometer was 29.71 in. Hg., ambient temperature was 74°F, and humidity was 70 gr/lb. Test conditions for individual observations are reported in Appendix E.

B. Distribution of Maximum Octane Number Requirements

The octane number requirement data were used to prepare satisfaction curves for the following samples of 1980 model vehicles: (1) U.S. and Imported Vehicles; (2) U.S. and Imported Cars; (3) U.S. Vehicles; (4) U.S. Cars; and (5) Imported Vehicles.

In preparing these curves, the percentages of vehicles satisfied were weighted in accordance with final 1980 U.S. model-year production data and with U.S. sales figures in the case of imports. Each curve should, therefore, provide an estimate of the distribution of octane number requirements of the appropriate vehicle population on the road. The procedure for assigning weighting factors is described in Appendix I.

1. U.S. and Imported Vehicles

In the 1980 Survey, maximum octane number requirements were determined on 429 U.S. and imported vehicles with PR, FBRU, and FBRSU fuels.

Maximum Research octane number requirements for all three reference fuel series are shown in Figures 2a (rectangular coordinates) and 2b (probability plot). Maximum Research, Motor, and (R+M)/2 octane number requirements are listed in Table VI. The 50% and 90% satisfaction level requirements are as follows:

<u>Fuel</u>	<u>Maximum Octane Number Requirements</u>					
	<u>50% Satisfied</u>			<u>90% Satisfied</u>		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	89.4	89.4	89.4	92.8	92.8	92.8
FBRU	90.8	83.5	87.2	95.1	86.2	90.6
FBRSU	92.7	82.2	87.5	97.7	85.2	91.4

Comparisons of 1980 and 1979 Survey maximum Research, Motor, and (R+M)/2 octane number requirements are shown in Tables VII, VIII, and IX, respectively, for the three fuel series. Distributions of maximum RON requirements are shown in Figure 3 for PR fuel, Figure 4 for FBRU fuels, and Figure 5 for FBRSU fuels. The differences at the 50% and 90% satisfaction levels are summarized below:

Differences Between 1980 and 1979 Maximum Octane Number Requirements

<u>Fuel</u>	<u>50% Satisfied</u>			<u>90% Satisfied</u>		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	0.1	0.1	0.1	-0.2	-0.2	-0.2
FBRU	-0.9	0.9	0.0	-1.9	-0.2	-1.1
FBRSU	0.3	0.2	0.3	-0.1	-0.8	-0.5

Confidence limits for maximum octane number requirement distributions of 1980 U.S. and imported vehicles are given in Appendix G, Table G-1. The 95% confidence limits for Research octane requirements were from ± 0.25 to ± 0.37 at the 50% satisfaction level and from ± 0.34 to ± 0.50 at the 90% satisfaction level.

2. U.S. and Imported Cars

Maximum octane number requirements were determined on 407 U.S. and imported cars with PR, FBRU, and FBRSU fuels.

Maximum Research, Motor, and (R+M)/2 octane number requirements on all three fuel series are given in Table X. Maximum octane number requirements at the 50% and 90% satisfaction levels are summarized below:

<u>Fuel</u>	<u>Maximum Octane Number Requirements</u>					
	<u>50% Satisfied</u>			<u>90% Satisfied</u>		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	89.2	89.2	89.2	92.7	92.7	92.7
FBRU	90.6	83.4	87.0	95.1	86.2	90.6
FBRSU	92.4	82.0	87.2	97.5	85.0	91.3

The maximum Research octane number requirements for 1980 U.S. and imported cars are compared with 1979 model-year data in Table XI for PR, FBRU, and FBRSU fuels; corresponding comparisons of Motor and (R+M)/2 octane number requirements are given in Tables XII and XIII, respectively. Differences between 1980 and 1979 data at the 50% and 90% satisfaction levels are as follows:

<u>Fuel</u>	<u>Differences Between 1980 and 1979 Maximum Octane Number Requirements</u>					
	<u>50% Satisfied</u>			<u>90% Satisfied</u>		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	0.0	0.0	0.0	-0.5	-0.5	-0.5
FBRU	-1.1	0.8	-0.2	-1.8	-0.2	-1.0
FBRSU	-0.2	-0.2	-0.2	-0.2	-0.9	-0.5

Confidence limits for maximum octane number requirement distributions of 1980 U.S. and imported cars are given in Appendix G, Table G-I. The 95% confidence limits for Research octane requirements were from ± 0.25 to ± 0.40 at the 50% satisfaction level and from ± 0.34 to ± 0.54 at the 90% satisfaction level.

3. U.S. Vehicles

Maximum octane number requirements were determined on 344 U.S. vehicles with PR, FBRU, and FBRSU fuels.

Distributions of maximum Research octane number requirements are plotted in Figures 6a and 6b for the three fuel series. Research, Motor, and (R+M)/2 octane number requirements for the U.S. vehicles are given in Table XIV. Octane number requirements at the 50% and 90% satisfaction levels are listed below:

<u>Fuel</u>	<u>Maximum Octane Number Requirements</u>					
	<u>50% Satisfied</u>			<u>90% Satisfied</u>		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	89.8	89.8	89.8	93.0	93.0	93.0
FBRU	91.4	83.8	87.6	95.5	86.4	90.9
FBRSU	93.4	82.6	88.0	98.1	85.5	91.8

A comparison of octane number requirements of 1980 and 1979 U.S. vehicles for the three fuel series is shown in Tables XV, XVI, and XVII in terms of RON, MON, and (R+M)/2, respectively. Distributions of maximum Research octane number requirements are shown in Figure 7 for PR fuel, in Figure 8 for FBRU fuels, and in Figure 9 for FBRSU fuels. Differences between octane number requirements of 1980 and 1979 U.S. vehicles at the 50% and 90% satisfaction levels are given in the following table:

<u>Fuel</u>	<u>Differences Between 1980 and 1979 Maximum Octane Number Requirements</u>					
	<u>50% Satisfied</u>			<u>90% Satisfied</u>		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	0.3	0.3	0.3	-0.3	-0.3	-0.3
FBRU	-0.9	0.8	0.0	-1.9	-0.3	-1.1
FBRSU	0.2	0.1	0.2	0.0	-0.7	-0.4

Confidence limits for maximum octane number requirement distributions of 1980 U.S. vehicles are listed in Appendix G, Table G-I. The 95% confidence limits for Research octane requirements were from ± 0.26 to ± 0.39 at the 50% satisfaction level and from ± 0.36 to ± 0.53 at the 90% satisfaction level.

4. U.S. Cars

Maximum octane number requirements were determined on 326 U.S. cars with PR, FBRU, and FBRSU fuels.

Maximum Research, Motor, and (R+M)/2 octane number requirements for all three fuel series are listed in Table XVIII, and summarized below at the 50% and 90% satisfaction levels:

<u>Fuel</u>	<u>Maximum Octane Number Requirements</u>					
	<u>50% Satisfied</u>			<u>90% Satisfied</u>		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	89.6	89.6	89.6	93.0	93.0	93.0
FBRU	91.3	83.8	87.5	95.5	86.4	90.9
FBRSU	93.1	82.5	87.8	97.9	85.4	91.6

The maximum Research, Motor, and (R+M)/2 octane number requirements of U.S. cars in the 1980 and 1979 Surveys are compared in Tables XIX, XX, and XXI, respectively, for all three fuel series. The differences at the 50% and 90% satisfaction levels are as follows:

<u>Fuel</u>	<u>Differences Between 1980 and 1979 Maximum Octane Number Requirements</u>					
	<u>50% Satisfied</u>			<u>90% Satisfied</u>		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	-0.1	-0.1	-0.1	-0.5	-0.5	-0.5
FBRU	-1.2	0.7	-0.3	-1.9	-0.3	-1.1
FBRSU	-0.4	-0.2	-0.2	-0.4	-1.0	-0.8

Confidence limits for maximum octane number requirement distributions of 1980 U.S. cars are given in Appendix G, Table G-I. The 95% confidence limits for Research octane requirements were from ± 0.28 to ± 0.41 at the 50% satisfaction level and from ± 0.37 to ± 0.56 at the 90% satisfaction level.

5. Imported Vehicles

Maximum octane number requirements were determined on 85 imported vehicles with PR, FBRU, and FBRSU fuels.

Maximum Research octane number requirements for all three reference fuel series are shown in Figures 10a and 10b. Maximum octane number requirements for RON, MON, and (R+M)/2 are listed in Table XXII. The 50% and 90% satisfaction level maximum octane requirements are listed below:

<u>Fuel</u>	<u>Maximum Octane Number Requirements</u>					
	<u>50% Satisfied</u>			<u>90% Satisfied</u>		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	88.0	88.0	88.0	91.5	91.5	91.5
FBRU	89.0	82.3	85.6	92.6	84.6	88.6
FBRSU	90.8	81.1	86.0	95.0	83.5	89.2

The maximum Research, Motor, and (R+M)/2 octane number requirements of imported vehicles in the 1980 and 1979 Surveys are compared in Tables XXIII, XXIV, and XXV, respectively, for all three fuel series. The differences at the 50% and 90% satisfaction levels are as follows:

<u>Fuel</u>	<u>Differences Between 1980 and 1979 Maximum Octane Number Requirements</u>					
	<u>50% Satisfied</u>			<u>90% Satisfied</u>		
	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>	<u>RON</u>	<u>MON</u>	<u>(R+M)/2</u>
PR	0.5	0.5	0.5	0.0	0.0	0.0
FBRU	0.1	1.2	0.6	-1.3	0.5	-0.4
FBRSU	1.5	1.0	1.3	0.1	-0.2	-0.1

Confidence limits for maximum octane number requirement distributions of 1980 imported vehicles are given in Appendix G, Table G-I. The 95% confidence limits for Research octane requirements were from ± 0.61 to ± 0.72 at the 50% satisfaction level and from ± 0.83 to ± 0.97 at the 90% satisfaction level.

6. Select Models

The select model group consisted of a total of six engine-chassis combinations. Five of these were the select models from the program scheduled to be tested. One other model (NIJ 244) had a sufficient number tested in the statistical sample and was included as a select model. The identification and specifications of the engine-chassis combinations are given in Table III.

Maximum Research and Motor octane number requirements for select models are shown for 50% and 90% satisfaction levels on PR, FBRU, and FBRSU fuels in Table II. Maximum octane number requirements for each select model at various satisfaction levels are listed in Appendix H, Table H-I. Maximum Research, Motor, and (R+M)/2 octane number requirements for the individual cars of each select model are given in Table H-II.

Maximum Research octane number satisfaction curves for the six select models are shown in Figures 11 through 16 for all three fuel series. The individual data points plotted on the figures represent the maximum requirements obtained on FBRU reference fuel. Each curve was constructed by use of the "Z" method, which is discussed in Appendix I. The 95% confidence limits for maximum requirements are given in Appendix G, Table G-III.

C. Engine Speed for Maximum and Part-Throttle Octane Number Requirements

Engine speeds where maximum octane number requirements occurred for each select model are shown in Table XXVI for PR, FBRU, and FBRSU fuels. Weighted data for all 1980 U.S. and imported vehicles are shown in Table XXVII and Figure 17 for both maximum and part-throttle octane number requirements. Vehicles tended to knock at higher speeds as the sensitivity of the reference fuel increased. Part-throttle octane requirements occurred at somewhat lower speeds than the maximum throttle requirements.

D. Octane Number Requirements at Part-Throttle

1. Maximum Octane Number Requirements at Part-Throttle

The throttle positions for maximum octane number requirements of tested vehicles were reported as full-throttle and/or part-throttle. The number and percentage of vehicles having FBRU part-throttle octane number requirements equal to or greater than full-throttle requirements are shown in Table XXVIII. The 1979 Survey data are shown for comparison. The percentages of all vehicles having maximum requirements at part-throttle were 15.9% for 1980, compared with 14.6% for 1979.

2. Part-Throttle Octane Number Requirement Distributions on FBRU Fuels

Part-throttle octane number requirements were determined on FBRU fuels at the critical manifold vacuum as defined in the CRC Test Procedure (Appendix C, Attachment 1). Weighted population distributions were developed from these data for the five vehicle categories: (1) U.S. and Imported Vehicles (389 vehicles); (2) U.S.

and Imported Cars (375 cars); (3) U.S. Vehicles (312 vehicles); (4) U.S. Cars (296 cars); (5) Imported Vehicles (77 vehicles). Part-throttle Research, Motor, and (R+M)/2 octane number requirements for each respective category are summarized in Tables XXIX, XXX, XXXI, XXXII, and XXXIII. Distribution of part-throttle Research octane number requirements are presented in Figures 18a and 18b for U.S. and imported vehicles, Figures 19a and 19b for U.S. vehicles, and Figures 20a and 20b for imported vehicles.

Maximum FBRU Research octane number requirements are compared with part-throttle requirements for U.S. and imported vehicles in Table XXXIV and Figure 21. The difference between maximum and part-throttle Research octane number requirements decreased with increasing octane number.

Part-throttle FBRU Research and Motor octane number requirements for the 1980 and 1979 Surveys are compared in Table XXXV for U.S. and imported vehicles, as well as U.S. vehicles only. Distributions of the part-throttle FBRU Research octane number requirements of the 1980 and 1979 U.S. and imported vehicles are shown in Figure 22 and U.S. vehicles only in Figure 23. At the 50% satisfaction level, the requirements of the 1980 U.S. and imported vehicle sample were 1.8 RON and 0.2 MON lower than the 1979 sample; at the 90% satisfaction level, the 1980 models were 1.3 RON lower and 0.5 MON higher than the 1979 models. Requirements for the 1980 U.S. vehicles only were 2.3 RON and 0.3 MON lower than the 1979 U.S. vehicles at the 50% satisfaction level and 0.8 RON lower and 0.8 MON higher at the 90% satisfaction level.

Confidence limits for part-throttle Research and Motor octane number requirement distributions for all five categories of 1980 vehicles are shown in Appendix G, Table G-II. The 95% confidence limits at the 50% and 90% satisfaction levels ranged from ± 0.51 to ± 0.87 for RON and ± 0.33 to ± 0.55 for MON for all cases except imported vehicles, which have much wider confidence ranges.

E. Tank Fuel

As required by the program, tank fuel was tested for incidence of knock whenever an owner's questionnaire was obtained; however, owner's questionnaires were obtained only when the vehicle tested had a regular driver and the ignition timing did not have to be reset. To gain additional information, tank fuel ratings were made by many participants on many other vehicles which did not meet the restrictions listed.

1. Owner-Observer Comparison of Tank Fuel Knock

Owner questionnaires were completed for 218 vehicles which had spark timing set to manufacturers' specifications. Of these vehicles, 51.1% were reported by trained observers to be knocking on tank fuel. Of the same 218 vehicles, 31.2% were reported by the owner to be knocking on tank fuel. This results in an owner versus observer detected knock ratio of 0.61 for 1980. Owner-observer comparison of tank fuel knock data for 1980, along with previous survey data, is presented in Table XXXVI.

2. Objectionable vs. Unobjectionable Knock

Objectionable knock was reported by the owners in 33 of the 218 vehicles tested. Of those owners reporting knock, 48.5% found that knock to be objectionable. This percentage of objectionable knock is much lower than the 60.8% reported in the previous 1979 Survey, as shown in Table XXXVI.

3. Tank Fuel Knock Reported by Trained Observers

Tank fuel knock observations were reported on 374 of the 429 test vehicles. The percentages of all 1980 vehicles and the select models knocking on tank fuel are shown in Table XXXVII. On a weighted basis, 49.9% of the 1980 vehicles knocked on tank fuel compared with 47.3% of the vehicles in the 1979 Survey and 47.2% in the 1978 Survey. It should be noted that these values on percent of all vehicles knocking reflect not only the octane requirements of the vehicles tested, but also the choice of the octane quality of the gasoline purchased by the customer.

4. After-Run on Tank Fuel

After-run was reported by trained observers on 10 of 404 vehicles tested on tank fuel for after-run in 1980. Owner questionnaires were completed for 218 vehicles on after-run. Of these vehicles, there were 25 reports of after-run on tank fuel. The higher percentage of after-run reports from owners is credible, since the trained observers' reports are based on a single data point (one observation) made on the fuel in the test vehicle's tank at the time of the Survey, while owners' reports are based on multiple observations using fuels of various octane quality.

Maximum FBRU octane requirements and tank fuel octane numbers for the vehicles with after-run reported by the owners (spark advance at manufacturers' recommended setting) are shown in Table XXXVIII.

F. Surface Ignition and Rumble

There was 1 car in the 1980 Survey reported with both surface ignition and spark knock; none had rumble. In the 1979 Survey, there were 3 reports of surface ignition.

G. Road Octane Number Depreciation of FBRU and FBRSU Fuels

Road octane number ratings and road octane number depreciation for FBRU and FBRSU fuels were determined from the octane requirement data for all vehicles. The results are shown in Table XXXIX.

In this report, the road octane number rating of FBRU and FBRSU fuels is defined as the primary reference fuel octane level which satisfied the same percentage of vehicles. Depreciation values were established by subtracting the road octane number rating of the fuel from its Research octane number. Depreciation values of FBRU fuels in the range 86 to 100 RON varied from 1.4 to 4.2, compared with 1.2 to 5.5 in the 1979 Survey. Depreciation of FBRSU fuels in the range 87 to 101 RON varied from 2.7 to 4.9, compared with 2.2 to 6.0 in last year's survey.

H. Speed Range Octane Number Requirements

Primary reference fuel octane number requirements at various engine speeds were determined on 337 U.S. and imported vehicles. Results were analyzed on 6 select models. The data are presented in Appendix F.

I. Gear Position for Maximum Requirements

The transmission gear position where maximum octane number requirements were observed with FBRU fuels is shown in Table J-1 of Appendix J. Of the 429 vehicles tested, 66% of the automatic transmission cars had the maximum requirements in the highest gear and 30% in passing gear. Eighty-five percent of the manual transmission cars had maximum requirements in the highest gear and 8% in a lower gear. Overall, 69% had maximum requirements in the highest gear and 25% in passing or lower gear.

ATTACHMENT 2 - Technique for Determination of
Octane Number Requirements of
Light Duty Vehicles

I. INTRODUCTION

The 1980 program of the CRC-Motor Octane Number Requirement Survey Group will consist of a survey of the octane number requirements of 1980 model domestic and imported vehicles. For the purposes of this program, the designation "passenger vehicles" will include passenger cars and light-duty (<8500 lb/3856 kg GVW) pickup trucks, and vans. Approximately 450 vehicles will be tested. Most of these vehicles will be sampled in proportion to their relative production or import volume, to provide data from which to estimate the distribution of octane number requirements for the 1980 model vehicle population in the United States. In addition, select models of special interest will be tested in sufficient numbers to estimate their requirement distributions.

Knocking characteristics will be investigated with three series of reference fuels. Tank fuel knock will also be evaluated. Maximum octane requirements, regardless of throttle opening, will be established for each vehicle using high sensitivity unleaded full-boiling range reference (FBRSU) fuels, average sensitivity unleaded full-boiling range reference (FBRU) fuels and primary reference (PR) fuels. The sensitivity of the FBRU series is similar to average unleaded commercial fuels currently marketed.

Maximum part-throttle octane requirements will be completely defined with FBRU reference fuels.

Octane requirements throughout the speed range will be obtained with PR fuels only. After-run characteristics will be observed on tank fuel.

II. GEOGRAPHICAL AREAS

As in previous years, the 1980 survey will be conducted on a nationwide basis. The country has been divided into four geographical areas. Participants located in New York, New Jersey, Delaware and Pennsylvania have been included in the Eastern area; those located in Ohio, Michigan and Kentucky comprise the East Central area; those in Illinois, Texas and Oklahoma comprise the West Central area; and California participants make up the Western area. A coordinator has been appointed for each area as follows:

Eastern Area	- S. Antika
East Central Area	- D. P. Barnard
West Central Area	- L. J. Olejnik
Western Area	- T. Wusz

The area coordinators will contact their area participants periodically regarding the progress of the survey. To expedite this, it is suggested that participants send copies of all correspondence concerning the survey to the area coordinators. This program outlines the survey in broad terms. If more detailed information is desired, it is suggested that the participant contact his area coordinator.

III. VEHICLES

A total of approximately 450 vehicles will be tested in the 1980 Survey. By requesting each participating laboratory to test 25 vehicles and assuming 18 participants, the 450-vehicle total is obtained. These will be divided into two groups: (1) the statistical group, sampled in proportion to U.S. car model production or import volume, and (2) select models of special interest. Approximately 20 of each of these select models will be tested to provide an estimate of the octane requirement distribution for each model. Some of these 20 vehicles will be those already included in the statistical group and the remainder will be additional vehicles added to the program.

The desired number of vehicles to be tested in each category is as follows:

Statistical group	400
Additional select model group	<u>50</u>
Total	450

A detailed breakdown of the specific models and the number of each model to be tested will be circulated to the participants in May, 1980, after an estimate of vehicle model production has been obtained. If a participant wishes to begin work before that date, he can test select models with certainty that at least one of each model will be assigned to him. Design specifications for select models to be tested in the 1980 Survey are shown below. Selection of these vehicles has been based on new or modified design characteristics that might have a significant effect on octane number requirements and high sales volume which allows individual treatment without additional testing.

Model	Displ.	No. Cyl.	No. Carb. Bbls.	Comp. Ratio	Net HP	Trans.	Type
Oldsmobile	307(5.0)	V-8	4	7.9	150	Automatic	
Chevrolet	229(3.8)	V-6	2	8.6	115	Automatic	
Pontiac	151(2.5)	L-4	2	8.2	86	Automatic	
Chevrolet	173(2.8)	V-6	2	8.5	115	Automatic	
Ford/Mercury Lincoln/TBird	302(5.0)	V-8	2	8.4	134	Automatic	FIOD
Fairmont/Zephyr	255(4.2)	V-8	2	8.8	119	Automatic	
Volare/Aspen/ Cordoba/Diplomat/Mirada	225(3.7)	L-6	1	8.4	90	Automatic	
Cord/Volare/Aspen (FED)	318(5.2)	V-8	2	8.5	120	Automatic	

Wherever possible, specific vehicle assignments to individual participating laboratories will be made in a pattern which tends to minimize data bias. This will be accomplished by apportioning cars of a given model among the four geographical areas, and subsequently among the laboratories within each area, in order to minimize the effect of non-random factors on the results of the survey.

IV. FUELS

A. Full-Boiling Range Reference Fuels

Two full-boiling range reference fuel series will be used to define the vehicle octane number requirements. The two series will be unleaded and of varying sensitivity. One series will be comparable to the average sensitivity of unleaded commercial fuels (FBRU); the other series (FBRSU) will be about two numbers higher in sensitivity than the FBRU fuels. The Research Octane Number (RON) range for both fuel series is 77 to 101.

The two series will be blended in increments of two RON up to 84 and one RON above 84 from three base fuels for each series. The base fuels are compounded from normal refinery gasoline components. Limiting specifications for each base fuel for both series are shown in Table I.

Research and Motor ratings will be determined for incremental blends of each fuel series by all participants to provide data for establishment of blending curves. The average ratings and blending curves will be circulated to all participants.

B. Primary Reference Fuels

Blends of ASTM-grade isooctane and normal heptane will be prepared in two octane number increments from 76 to 82 and one octane number increments from 82 to 100.

C. Tank Gasoline

Research and Motor octane ratings will be obtained only on gasoline samples from the tank of vehicles with owner questionnaire (Attachment 1). Owners' questionnaire should be deleted when,

- a. the vehicle does not have a regular driver
- b. the ignition timing had to be reset.

V. TEST TECHNIQUE

All tests are to be conducted using the technique entitled, "Technique for Determination of Octane Number Requirements of Light Duty Vehicles" (CRC Designation E-15-80). A copy of this technique is included as Attachment 2 to this program. Octane number requirement investigations are to be conducted in all vehicles under level road conditions. Any vehicle obviously in poor mechanical condition or with malfunctioning emission control devices should not be considered for test work. The vehicles should have a minimum of 6000 deposit miles (9656 km) and preferably be privately owned and operated. Vehicles previously used for road octane rating must not be employed in this survey.

Data should be reported on each vehicle tested even though knock was not encountered on any of the fuels.

The order in which the fuels are to be tested is as follows:

1. Tank fuel, 2. FBRSU, 3. FBRU, 4. PR.

VI. DATA FORMS

The test results on each vehicle will be reported on data form (DFMF-11-1180) and work form (DFMF-12-1180). Copies of these forms will be mailed to all participants from the CRC office with instructions for their use printed on the forms. Additional instructions are included in each test technique.

VII. REPORTING RESULTS

A consolidated data report form (DFMF-15-1180) and speed range summary form (DFMF-25-1180) will also be provided by CRC. The consolidated report forms and standard data forms for each vehicle tested should be submitted to the Coordinating Research Council, Inc., 219 Perimeter Center Parkway, Atlanta, Georgia 30346, as soon as possible but not later than October 31, 1980.

Minimum of two units sensitivity difference between corresponding fuels of each series.

OWNER'S QUESTIONNAIRE
CRC OCTANE NUMBER REQUIREMENT SURVEY

OWNER:

Your vehicle is being tested for fuel octane number requirements by a Coordinating Research Council activity. To help analyze the data, we would like the person who has recently been driving the vehicle to answer the following questions:

1. Has any engine knock (ping) been encountered recently?

☐ Yes ☐ Occasionally
☐ No ☐ Frequently

2. If "Yes" was it during any of these conditions?

☐ Low Speed ☐ Hill Climbing ☐ Normal Acceleration
☐ High Speed ☐ Towing Trailer ☐ Maximum Acceleration

3. Did you consider the knock (ping) objectionable?

☐ Yes ☐ No

4. Did the knock (ping) occur on the fuel that is now in the tank?

☐ Yes ☐ No

5. Does the engine continue to run after the key is turned off?

☐ Yes ☐ No

6. If "Yes," did you consider the engine running with the key off objectionable?

☐ Yes ☐ No

Vehicle Make _____ License No. _____

Vehicle Identification No. _____

TECHNIQUE FOR DETERMINATION
OF OCTANE NUMBER REQUIREMENTS
OF LIGHT DUTY VEHICLES

(CRC Designation E-15-80)

Revised

February, 1980

TECHNIQUE FOR DETERMINATION
OF OCTANE NUMBER REQUIREMENTS
OF LIGHT DUTY VEHICLES

(CRC Designation E-15-80)

A. GENERAL

The technique provides for the determination of octane number requirements of a vehicle in terms of borderline spark knock and surface ignition knock, regardless of throttle position, on two series of full-boiling range reference fuels as well as on primary reference fuels. It also provides octane requirements throughout the speed range on primary reference fuels.

Spark knock, surface ignition and after-run characteristics of tank fuel will also be determined.

B. DEFINITION OF TERMS

1. The following definitions of knock were approved by the CFR and CLR Committees on June 8, 1954, and will be used in this technique. Knock is the noise associated with autoignition* of a portion of the fuel-air mixture ahead of the advancing flame front. The flame front is pre-supposed to be moving at normal velocity. With this definition the source of the normal flame front is immaterial -- it may be the result of surface ignition or spark ignition.

- a. Spark Knock: A knock which is recurrent and repeatable in terms of audibility. It is controllable by the spark advance; advancing the spark increases the knock intensity and retarding the spark reduces the intensity. This definition does not include surface ignition knock.
- b. Surface Ignition Knock: Knock which has been preceded by a surface ignition. It is not controllable by spark advance.** It may or may not be recurrent and repeatable.

* Autoignition: The spontaneous ignition and the resulting very rapid reaction of a portion or all of the fuel-air mixture. The flame speed is many, many times greater than that which follows normal spark ignition. There is no time reference for autoignition.

** For the purpose of this program, it is not intended that surface ignition knock be identified by manipulation of the spark advance.

Attachment 2

2. The following definitions of knock intensity were specifically adopted for use in this technique:
 - a. No Knock: This means no spark knock or surface ignition knock.
 - b. Borderline Knock: This means spark knock of lowest audible intensity, recurrent surface ignition knock of borderline intensity, or infrequent (three or less) surface ignition knocks regardless of intensity.
 - c. Above Borderline Knock: This means greater than borderline spark knock, recurrent surface ignition knock greater than borderline intensity, or frequent (four or more) surface ignition knocks regardless of intensity.
 - d. After-Run: The engine continues to operate after the ignition is turned off.

3. Definition of Accelerations

Accelerations are made at maximum-throttle and part-throttle conditions which are defined below:

- a. Maximum-Throttle: The throttle is depressed and regulated throughout the acceleration to maintain the critical maximum throttle position. Maximum throttle will constitute the throttle position from detent to 2 inches Hg (6.7 KPa) above detent manifold vacuum. (This could be in highest gear or passing gear for automatic transmissions.) The detent manifold vacuum obtainable on a given model is determined by the transmission characteristics.
- b. Part-Throttle: The throttle is depressed and regulated throughout the acceleration to maintain a desired, constant critical manifold vacuum. Part-throttle will constitute the throttle position from 2 inches Hg (6.7 KPa) above detent vacuum up to the highest road load vacuum. For vehicles with converter clutch transmissions, part-throttle will constitute the throttle position from 1 inch Hg (3.4 KPa) above the minimum vacuum for converter clutch application up to the highest road load vacuum.

C. VEHICLE PREPARATION

The following vehicle preparation steps should be completed before any octane tests are run. Detailed procedures for each adjustment can be found in the manufacturers' shop manuals.

1. Record vehicle identification number and emission control type, Federal, Altitude or California. Fill in heading on data sheet DFMF-11-1180. Ford emission calibration numbers are to be recorded.

2. Inspect all vacuum lines and air pump hoses for appropriate connections. Also, check to see if PCV valve, distributor vacuum delay valve, EGR valve and heated inlet air mechanism are functioning. Engine must be warmed up for these checks.
3. Record engine idle speed and observe anti-dieseling solenoid operation. Adjust to manufacturers' recommended specifications as specified on the under-hood decal.
4. Observe and record basic spark timing at recommended engine speed. Adjust to manufacturers' recommended setting as specified on the under-hood decal.
5. Crankcase oil, radiator coolant, automatic transmission fluid, and battery fluid levels shall be maintained as recommended by the manufacturer.
6. A calibrated tachometer graduated in 100 rpm (or smaller) increments and capable of indicating engine speed from 0-5000 rpm shall be installed on each vehicle.
7. One calibrated vacuum gage, graduated in one-half inch of mercury (or smaller) increments and capable of indicating vacuum from 0-24 inches of mercury (0-81 KPa) shall be connected to the intake manifold.
8. An auxiliary fuel system shall be provided to supply test fuels to the engine. Caution shall be taken to avoid placing auxiliary fuel lines in locations which promote vapor lock. If vehicles with carbureted engines have tank return fuel lines, this return line should be blocked off. Disconnect line from fuel tank to evaporation control system canister. Instructions for fuel handling with fuel injection systems is shown in the Appendix.
9. For vehicles with owner questionnaire completed, a sample of the tank gasoline shall be withdrawn for determination of Research and Motor method octane number ratings.

D. TEST PROCEDURE

1. Engine Warm-Up

- a. To stabilize engine temperatures, a minimum of ten miles of warm-up is required. The test vehicle should be operated at 55 mph (88 kph) in top gear with a minimum of full-throttle operation.
- b. During the warm-up period, the general mechanical condition of the vehicle should be checked to insure satisfactory and safe operation during test work.

2. Fuel Change-Over

Caution: Because of the installation of catalytic devices on these vehicles, permanent damage may result if the engine runs lean or stalls. Therefore, change-over from one fuel to another must be accomplished without running the carburetor or fuel injection system dry. Fuel handling procedures for vehicles equipped with fuel injection systems are explained in the Appendix.

To eliminate contamination of the new fuel with residual amounts of the previous fuel, flush system twice with new fuel.

After fuel change-over, make one maximum-throttle acceleration before beginning Vehicle Rating Procedure.

3. Details of Observations

a. Operating Conditions

All octane number requirements will be determined under level road acceleration conditions. Vehicles with manual transmission should not be tested in overdrive gear. Vehicles equipped with free wheeling or overdrive units shall be tested with this unit (free wheeling or overdrive) locked out of operation. Automatic transmissions shall be run in "Drive". Test accelerations will be made as described below under 3d in highest drive gear.

Tests will be conducted on moderately dry days preferably at ambient temperatures above 60°F (15.5°C). Tests should not be conducted during periods of high humidity such as prevail when rain is threatening or during or immediately after a rain storm. Laboratories with control capabilities should target for 70°F (21°C) air temperature and 50 grains of water per pound (7.14 gm/kg) of dry air whenever possible.

Air conditioned vehicles will be tested with air conditioner turned ON. (Normal setting, low fan.)

b. Order of Fuel Testing

- | | |
|----------|------------|
| 1. Tank | 3. FBRU |
| 2. FBRSU | 4. Primary |

c. Determination of Knock Intensity

Octane requirements will be established by evaluating the occurrence of knock in terms of knock intensity: "N" for none, "B" for borderline, and "A" for above borderline. Establishment of representative knock intensity for a given fuel will be accomplished with the fewest number of accelerations possible. As defined below, the first two duplicating accelerations are sufficient with "N" and "B" knock intensity.

Attachment 2

<u>Number of Accelerations</u>			<u>Representative Rating</u>
<u>1</u>	<u>2</u>	<u>3</u>	
N	N	-	N
N	B	N	N
N	B	B	B
B	N	B	B
B	B	-	B
B	A	-	A
A	-	-	A

All subsequent accelerations will normally be discontinued when "A" knock intensity is experienced and testing continued with a higher octane number fuel in that series. An exception will be made if "A" knock is experienced on the highest octane fuel which knocks in the engine. In this case, it may be necessary to run additional accelerations to determine the speed of maximum knock intensity. If "A" knock is experienced at initiation of acceleration, as limited by transmission characteristics, this speed will be considered the speed of maximum knock. Otherwise, the midpoint between knock-in and knock-out will be considered the speed of maximum knock. When establishing knock-in and knock-out, back off on the throttle between points to eliminate "A" knock. Tip-in knock should be ignored.

d. Determination of Maximum Octane Requirement

Tests should be run to 60 mph (97 kph) unless required to terminate at 55 mph (88 kph) because of legal speed limits.

1. Vehicle Operating Procedure (for driver)

- a. For establishment of transmission characteristics, obtain top gear downshift engine rpm and manifold vacuum at 25, 35, 45 and 55 mph (40, 56, 72, 88 kph) by movement of the throttle through the detent position. Record both engine rpm and manifold vacuum at the downshift point for each speed. The vehicle brakes may be applied lightly if necessary to maintain vehicle speed. In addition, for transmissions with converter clutches determine the minimum vacuum and minimum road speed for converter clutch application. Record on data sheet.
- b. For maximum throttle requirements in highest gear accelerate at the critical maximum throttle position from the minimum obtainable speed as determined in (a)* up to 60 mph (97 kph). To obtain critical maximum throttle position, move the throttle from detent to 2 inches Hg (6.7 KPa) vacuum above detent while accelerating. For vehicles with converter clutch transmissions perform this acceleration with the converter clutch applied and released. Find the throttle position for the maximum knock intensity. If transmission downshifts abort and start acceleration again.

* Starting speed for accelerations on manual transmission vehicles should be the lowest speed from which the vehicle will accelerate smoothly.

Attachment 2

- c. For maximum throttle requirements in passing gear for vehicles with automatic transmissions, accelerate from 10 mph (16 kph) below the starting speed for highest gear acceleration up to 60 mph (97 kph). When available, set shift gear selector to passing gear.
- d. For those vehicles with vacuum delay devices, to stabilize vacuum advance before starting each part-throttle acceleration, operate at road load for 40 seconds at the speed from which the acceleration is to begin.
- e. For part-throttle requirements, accelerate in highest gear at constant critical manifold vacuum from minimum obtainable speed to 60 mph (97 kph) or until vehicle ceases to accelerate. To obtain critical part-throttle vacuum, operate at road load for 40 seconds at 25, 35, 45, and 55 mph (40, 56, 72 and 88 kph). At each speed move the throttle from the highest road load vacuum, down to 2 inches Hg (6.7 KPa) above detent manifold vacuum (1 inch Hg (3.4 KPa) above the minimum vacuum for converter clutch application) in from 3 to 5 seconds. In this range, find a manifold vacuum for maximum knock intensity to use as the critical vacuum for all subsequent part-throttle accelerations. The vehicle brakes may be applied lightly if necessary, to maintain vehicle speed.

f. Determination of After-Run Characteristics

Determination of the occurrence of after-run will be evaluated on tank fuel. Following the engine warm-up, moderately brake the vehicle to a stop (foot off throttle) and place automatic transmission vehicles in park position, manual transmission vehicles in neutral. Air conditioner must be left off. Immediately turn key to the "OFF" position. Note on the data sheet if after-run occurs.

2. Vehicle Rating Procedure (for rater)

Knock rating should be performed while in a normal seated position (head above instrument panel) with floor mats in place.

Step 1 - Using an estimated non-knocking fuel in a given fuel series, investigate for incidence of knock under conditions as described in 3d (1) (b), and 3d (1) (c) above.

Step 2 - If no knock occurs, go to a lower octane number blend in that series and repeat Step 1.

Attachment 2

- Step 3 - If knock occurs at one or more of the operating conditions in Step 1, then continue investigation at the critical condition(s) with higher octane blends until highest octane fuel giving knock is determined within one octane number or one blend. Record maximum knock intensity on all fuels and speed of maximum knock intensity on highest octane fuel that knocks.
- Step 4 - Using the lowest octane blend that did not knock in Step 3, investigate for incidence of part-throttle knock as described in 3d (1) (e).
- Step 5 - If no knock occurs with FBRU Fuel, investigate for knock with lower octane fuels until maximum part-throttle requirement is defined down to the limit of the lowest octane fuel available. If no knock occurs with PRF and FBRU fuels, further investigations are not required with these fuels at part-throttle.

The rating procedure is given in arrow diagram form on page 16.

e. Tank Fuel Observations on Vehicles with Owner's Questionnaire

Investigate for maximum-throttle and part-throttle knock as detailed in Item 3d (1). Define maximum knock intensity as per Item 3c. Record maximum knock intensity, speed of maximum knock intensity and manifold vacuum at each operating condition. Determine after-run characteristics as described in Item 3d (1) (f).

f. Octane Number Requirement Over Speed Range

Octane requirements over the speed range will be obtained on primary reference fuels only using throttle position for maximum requirements. These will be established by recording the knock-in and knock-out points during maximum requirement acceleration with each incremental fuel investigated. It may be necessary to test one or two additional lower octane fuels to describe the knocking characteristics over the speed range. Accelerate at maximum throttle from minimum obtainable speed as determined in 3d (1) (a) up to 3500 rpm if necessary in order to define requirements. These should be run to 60 mph (97 kph) unless required to terminate at 55 mph (88 kph) because of legal speed limits. If 3500 rpm cannot be attained in top gear, accelerations shall be discontinued and resumed in the next highest gear from 500 rpm below the engine speed at which top gear accelerations were determined.

When "A" knock is experienced, continue the acceleration but back off on the throttle to maintain "B" knock until just prior to the knock-out point.

Attachment 2

E. INTERPRETATION OF DATA

The data will be recorded on data sheet (DFMF-11-1180). Maximum octane requirements for all reference fuels shall be determined as follows:

1. If the knock intensity of the highest fuel giving knock is borderline, the requirement shall be reported as the octane number of that fuel.
2. If the knock intensity of the highest fuel giving knock is above borderline, the requirement shall be reported as one-half the difference between the fuel giving knock and the next highest fuel.

Speed range data shall be reported on data sheet (DFMF-11-1180) as the engine speed of knock-in and knock-out for the octane number of the primary reference fuel tested.

When transferring data to the summary report form, record "no" data as well as "yes" data.

Record data on all fuels tested, even though knock was not encountered. When transferring data to the summary report form (DFMF-15-1180), record results on all fuel series for each throttle condition investigated. Use proper letter designation (see footnotes on summary sheet) to designate requirements outside of the reference fuel limits.

Requirements for the various engine speeds will be determined by fitting a smooth curve through the knock-in and knock-out points on work form (DFMF-12-1180). Primary reference fuel requirements at various engine speeds should be reported to the nearest one-half octane number and recorded on the speed range summary sheets (DFMF-25-1180).

It is important that the vehicle identification number (VIN) of each vehicle tested be recorded on all data and summary sheets to provide a means of cross-indexing.

APPENDIX
CRC E-15-80

PROCEDURE FOR SETTING UP VEHICLES AND HANDLING
REFERENCE FUELS ON VEHICLES EQUIPPED WITH FUEL INJECTION

1. To run octane requirements on fuel injected vehicles it is necessary to run an external fuel line to the inlet of the vehicle fuel injection pump.
2. The fuel return line from the engine to the fuel tank must be disconnected after the fuel pressure regulator (in engine compartment) and before the fuel tank. An auxiliary line long enough to reach the cans must be added to the fuel return line.
3. Make certain that the fuel tank connections are plugged, this means both the normal fuel pump inlet line and the normal fuel return line connection. On vehicles with an in-tank booster pump, this pump must be shut off so it cannot run during the time the vehicle is operating on the external fuel system. If this pump is not disconnected, it will be destroyed.
4. An electric fuel pump (Bendix type acceptable) must be used to draw fuel from the reference fuel can to supply the fuel injection pump on the vehicle. Caution must be exercised to keep the fuel line between the reference fuel cans and the vehicle fuel injection pump full of fuel. If very much air gets into this line, the fuel injection system will become air bound and it is difficult to get the air out of the system.
5. Once the fuel injection pump line and return line have been disconnected, all subsequent operations must be done from an external fuel source.
6. It is possible to use three-way valves in the fuel line between the fuel pump and the fuel tank and between the return line and the fuel tank. When used, the operator must change the return line valve to the auxiliary fuel system while the engine is shut down, to avoid building up excessive pressure in the return line which could damage both the fuel pressure regulator and injection pump.
7. When changing from one reference fuel to another, the following steps must be followed:
 - a. Put fuel inlet line in reference fuel tank with the return line going to a slop fuel can. Do not keep fuel inlet line out of the fuel can any longer than is necessary to move it from one can to the next. DO NOT RUN OUT OF FUEL.

Attachment 2

- b. Observe the fuel stream in the fuel return line. As soon as a steady flow of fuel is observed, move the fuel return line to an empty one-quart can (0.946 l). Allow one quart (0.946 l) of fuel to flow into this can before inserting the return line into the chosen reference fuel can. This operation should take about 60 seconds.
- c. When going to the next reference fuel, it will be necessary to repeat Steps a and b.

The fuel injection pumps on most vehicles pump between 30 and 50 gallons (114-189 l/h) of fuel per hour. Therefore, Steps a and b should be followed very closely or there will be gross reference fuel contamination or you will use a lot more reference fuel than is required to run each test. If Steps a and b are followed exactly you will be discarding to slop about two quarts (1.892 l) of reference fuel each time you change reference fuels. The two quarts (1.892 l) to slop will be at least as much fuel as is consumed to get the reference fuel rating.

1980 OCTANE NUMBER REQUIREMENT SURVEY DATA

G L O S S A R Y

Emission Certification:	C	California
	F	Federal
	B	Both California and Altitude
Knock Sensor:	Y	Yes
	N	No
Transmission:	A	Automatic
	M	Manual
Air Conditioner:	Y	Yes
	N	No
Spark Advance:	+	Before Top Center
	-	After Top Center
Test Fuel:	1	Tank Fuel
	2	FBRU
	3	FBRU
	4	PR
Gear:	D	Drive, Automatic Transmissions
	P	Passing Gear, Automatic Transmissions
	1-5	Manual Transmissions
Octane Number Requirements: (expressed as Research O.N.)	L	Less than lowest available O.N. for FBRU and FBRU fuels and less than 76 for PR fuels
	H	Higher than highest available O.N. for FBRU and FBRU fuels and higher than 100 O.N. for PR fuels
Noise Type:	K	Spark knock only
	S	Surface ignition knock only
	B	Both K and S

Tank FuelOwner Report

Knock:	Y	Yes
	N	No
Objectionable:	Y	Yes
	N	No
After-Run:	Y	Yes
	N	No

Rater Report

Noise Intensity:	N	None
	B	Borderline
	A	Above borderline
Throttle:	M	If knock at maximum throttle
	MV	Manifold vacuum if knock at part-throttle
After-Run:	Y	Yes
	N	No

SPEED RANGE DATA

APPENDIX F

Primary Reference Fuel Speed Range Octane Number Requirement

Primary reference fuel octane number requirements were determined at one to eleven of the specified engine speeds on 337 vehicles (Table F-I). Speed range data were analyzed for the six select models, totaling 79 cars, and are plotted in Figures F.1 through F.6 for the mean (50% satisfaction level). For 21 cars in the select model category, the speed range data were either missing or insufficient for analysis. The select model calculated data are given in Table F-II.

CONFIDENCE LIMITS OF
OCTANE NUMBER REQUIREMENT DISTRIBUTIONS

CONFIDENCE LIMITS OF OCTANE NUMBER REQUIREMENT DISTRIBUTIONS

Octane number requirements of vehicles presented in this survey are determined at the levels that satisfy certain percentages of specific vehicle populations. In many cases, the recorded octane number requirement is followed by a plus and minus limit, referred to as the confidence interval. These limits give the interval within which the requirement for that satisfaction level would be expected 95% of the time in replicate testing.

At the 50% satisfaction level, the 95% confidence interval is calculated as follows:

$$CI = \pm ts / \sqrt{n}$$

where t = Students t at the proper number of degrees of freedom*

s = Standard deviation, calculated directly from the data or estimated as the difference between the 84.16th and 50th percentiles (assuming normal distribution)

n = Number of vehicles in population.

At other satisfaction levels:

$$CI = \pm ts \sqrt{1/n + k^2/[2(n-1)]}$$

At the 90% satisfaction level, k = 1.2817. For other satisfaction levels, appropriate values for k may be found in the standard statistical tables.

* Distribution of t for probability = 0.05.

Degrees of Freedom**	t	Degrees of Freedom	t

PROCEDURES FOR PLOTTING
OCTANE NUMBER REQUIREMENT DISTRIBUTION DATA

WEIGHTED VEHICLE/CAR POPULATIONS

Weighting factors for each vehicle model were developed from information supplied by the U.S. Vehicle Manufacturers and from information published (Ward's Automotive Reports) for imported vehicles. These weight factors were proportioned to the relative production and/or sales volumes of the vehicles tested.

For any vehicle having octane requirements lower (L) than the lowest octane number fuel available within a given fuel series, a number 0.5 Research/0.4 Motor lower was assigned. Similarly, for any vehicle having octane requirements higher (H) than the highest octane fuel available within a given fuel series, a number 0.5 Research/0.4 Motor higher was assigned.

The weighting factors of each vehicle model were divided by the number of vehicles tested to calculate individual vehicle weight factors. The octane requirements for each vehicle were then arranged in increasing order with the appropriate individual weighting factors. The percent of vehicles at each octane requirement level represents the summation of all vehicle weighting factors before that level, plus one-half the sum of the weighting factors at that level. The individual vehicle weighting factors are adjusted so that the summation of all weighting factors is 100.00 for any vehicle population of interest. The midpoint percentiles are plotted versus octane number requirement on arithmetic probability paper and a distribution curve is drawn through the points. These distributions are then plotted point to point on Cartesian coordinates for figures shown in the survey report.

SELECT CAR MODELS

For individual car models, the octane number requirement distribution curves were plotted by the "Z" method as described in "Statistical Estimation of the Gasoline Octane Number Requirement of New Model Automobiles," C. S. Brinegar and R. R. Miller, Technometrics, Vol. 2, No. 1, February 1960.

The procedure is as follows:

For any cars having octane requirements lower (L) than the lowest octane number fuel available within a given fuel level, a number 0.5 Research/0.4 Motor lower was assigned. Similarly, for individual cars having octane requirements higher (H) than the highest octane fuel available within a given fuel series a number 0.5 Research/0.4 Motor higher was assigned.

Using all observed and estimated octane number values, calculate the mean ($\bar{X}$) and the standard deviation (S) from the data for each car model.

1.

$$\bar{X} = \frac{\sum X_i}{n}$$

$$s = \sqrt{\frac{1}{n-1} \left[\sum X_i^2 - \left(\frac{\sum X_i}{n} \right)^2 \right]}$$

Where X_i = Octane number requirement of the i^{th} car of a given model

n = Number of cars of that model.

2. Estimate octane number requirements at the percentiles of interest from octane number requirement distribution data by

$$O.N. = \bar{X} + ks$$

where k is selected from normal distribution tables.

Values of k used to calculate percentiles in this report are:

<u>Percentile</u>	<u>k</u>
5	-1.645
10	-1.282
20	-0.842
30	-0.524
40	-0.253
50	0
60	+0.253
70	+0.524
80	+0.842
90	+1.282
95	+1.645

The requirements were arranged in increasing order and plotted on arithmetic probability paper; the percent satisfaction for any car is calculated by the following relationship:

$$\text{Percent satisfied: } i^{\text{th}} \text{ car} = \frac{(i-0.5)}{N} 100$$

where N is the total number of cars tested for a given fuel
and i is an integer having increasing values from 1 to N .

Curves may either be faired through the plotted points or a straight line superimposed using the mean and standard deviation calculated above. From inspection of these curves, revised L and H values may be indicated. If so, new means and standard deviations may be calculated.
