PREFACE

The Analytic Sciences Corporation (TASC), under contract to the Director of Net Assessment, Office of the Secretary of Defense (OSD/NA), MDA903-78-C-0294, has developed a method for assessing comparative tactical aviation modernization. That methodology is called TASCFORM-AIR.

→ Management Consulting & Research, Inc. (MCR), under subcontract ~~to~~ assist in this effort, has developed the US Military Aircraft Cost Handbook. The data contained in the handbook are based on the annual Total Obligational Authority (TOA) flyaway costs for a large number of aircraft programs. These aircraft cost data have been used as the basis for integrating cost-performance relationships into the TASCFORM-AIR methodology.

The handbook was originally published in June 1981 as the US Tactical Aircraft Cost Handbook. Since that time, it has been updated and expanded. This edition was produced as part of the current TASC/MCR effort for OSD Net Assessment to build on the earlier cost-performance work conducted for that office.

Any comments or suggestions for improving the contents or the utility of the handbook would be greatly appreciated.

ACKNOWLEDGEMENTS

The authors wish to thank the following individuals for contributing their time and expertise to this effort. Without their assistance, development of the original and this revised edition of the handbook would have been more difficult and less complete.

From the Naval Air Systems Command, Mr. Thomas Gilbride was extremely helpful in making historical Navy budget data available and discussing various aspects of changes in Navy aircraft procurement programs.

Mrs. Barbara Rizzuto and Mrs. Linda Lucas, from the Office of the Comptroller of the Air Force, were instrumental in providing historical Air Force budget data for this effort.

In the Office of the Comptroller for the US Army Troop Support and Aviation Materiel Readiness Command, Mr. John Gargaro and Mr. Joseph Gallucci coordinated the data collection effort for the Army attack helicopters.

From The Analytic Sciences Corporation (TASC), Mr. John Underwood and Mr. Leonard Sullivan, Jr., made significant contributions to the scope and content of the handbook.

I. INTRODUCTION

This section describes the background, overview and organization of the US Military Aircraft Cost Handbook.

A. BACKGROUND

Management Consulting & Research, Inc. (MCR) under sub-contract to the Analytic Sciences Corporation (TASC), examined methods for integrating measures of cost into the TASCFORM-AIR methodology.^{1/} This work resulted in a feasibility study of developing consistent measures of cost to be used with the TASCFORM-AIR measures of performance.^{2/} As a direct result of the feasibility study, the US Tactical Aircraft Cost Handbook was developed.^{3/} From the data contained in the original handbook, TASC was able to achieve its goal of integrating cost into the TASCFORM-AIR methodology.

The MCR portion of the work was concluded in the summer of 1981. A year later, continued interest in the TASCFORM-AIR results suggested that an update and expansion of the original handbook would be useful. This edition of the handbook, retitled US Military Aircraft Cost Handbook, is the result of that effort.

1/ The TASCFORM-AIR Model: A Technique for Assessing Comparative Force Modernization in Tactical Aviation, Volume I: Methodology Development, TR-1334-3, The Analytic Sciences Corporation, 1 February 1980.

2/ Task IA Report: Feasibility Study for Integrating a Cost Methodology into the TASCFORM-AIR Model, TR-8007-1R, Management Consulting & Research, Inc., 18 November 1980.

3/ US Tactical Aircraft Cost Handbook, Volume I: Preliminary Analysis, Volume II: Data, TR-8007-2R, Management Consulting & Research, Inc., 15 June 1981.

B. OVERVIEW OF THE HANDBOOK

This subsection describes how the handbook was developed and discusses some potential applications.

1. Handbook Development

The aircraft contained in this handbook fall into five major categories:

- attack aircraft,
- fighter aircraft,
- bombers,
- attack helicopters, and
- patrol aircraft.

To obtain cost data for these aircraft, the Office of the Director, Net Assessment (OSD/NA) requested Service assistance in providing the data for this effort. The Air Force and the Navy made their historical cost data available to the MCR data collection team; the Army responded to the data request by completing a set of data forms provided to them. Thus, the data contained in this handbook are based on historical Service data.

The Services provided, when possible, the following types of cost information for each Mission/Design/Series aircraft of interest:

- the annual Total Obligational Authority (TOA) in then-year (current) dollars;
- the procurement quantities associated with those annual TOA dollars; and

- a breakout of the TOA dollars for each aircraft by the major categories of:
 - airframe,
 - engines,
 - electronics,
 - armament, and
 - other.

Once the Service data were in hand, some adjustments were necessary to ensure consistency. Of particular note is the normalization of costs to a constant fiscal year base (FY81). The indices used in this normalization process are described in detail in Appendix A to the handbook; the appendix is an extraction from a standard MCR publication.

2. Applications

The applications for the cost data contained in this handbook are many. Examples are:

- comparing aircraft program budget costs,
- developing cost-quantity relationships, and
- examining cost relationships in conjunction with aircraft performance.

The initial objective of developing this handbook was to provide a consistent set of cost measures that could be used with aircraft performance measures derived from TASCFORM-AIR. The TASCFORM-AIR model is designed to measure the force performance of tactical aircraft. The TASCFORM-AIR measures are relative measures of the capability of tactical aircraft forces, based

on the physical, performance, availability, and employment characteristics of the aircraft. This handbook provides a consistent set of investment (flyaway) cost data that can be used with the TASCFORM-AIR methodology.

The data has had other applications as well and it is hoped that the handbook will continue to be a useful tool for aircraft analyses in which flyaway cost measures are addressed.^{4/}

C. ORGANIZATION OF THE HANDBOOK

Following this introduction are three major sections and two appendices:

- Section II deals with the data collection effort undertaken by MCR to assemble the raw cost and physical and performance data for the aircraft of interest.
- Section III describes how the data were organized and adjusted to create the cost data base contained in Section IV.
- Section IV contains the aircraft cost data collected, displayed in then-year and constant FY81 dollars, with unit and cumulative average cost calculations.

Appendix A contains a more thorough discussion of the use of defense economic indices and associated limitations when normalizing cost data. Appendix B lists references used in developing the handbook.

^{4/} For example, see RTD&E and Flyaway Cost-Estimating Relationships for Fighter/Attack Aircraft, CAG Technical Memorandum No. 36., Institute for Defense Analyses, July 1982.

II. DATA COLLECTION

This section addresses the aircraft data collected for this handbook. Two types of data were of interest: (1) physical and performance characteristics, and (2) cost data. The collection of these types of data is discussed below.

Before data could be collected, however, the aircraft of interest had to be identified. The TASC report on the TASCFORM-AIR model identified US Air Force, Navy, Marine Corps, and Army aircraft.^{5/} These aircraft are combat-oriented and were in the active US inventory in the FY 1960-1980 period. Not included, therefore, were trainers, reconnaissance, or electronic warfare variants or those aircraft produced for foreign military sales (FMS). The aircraft included the following types:

- attack aircraft,
- fighter aircraft,
- tactical bombers, and
- attack helicopters.

Exhibit II-1, on the following page, is taken from that early TASC report and shows the aircraft of original interest. Some aircraft are identified only by Mission/Design or Type/Model (e.g., F-84) while others are identified by Mission/Design/Series or Type/Model/Series (e.g., A-7D).^{6/} For this revised edition

^{5/}The TASCFORM-AIR Model, TR-1334-3, The Analytic Sciences Corporation, 1 February 1980.

^{6/}The USAF and the Army use the term Mission/Design/Series (M/D/S) to designate aircraft while the USN uses the term Type/Model/Series (T/M/S) to designate aircraft. Because the greater number of USAF/USA aircraft are represented in the handbook, Mission/Design/Series (M/D/S) is used generically for all aircraft.

Exhibit II-1. US AIRCRAFT OF INTEREST CATEGORIZED BY TASCFORM-AIR SUB-MISSIONS AND ROLES

of the handbook, several additional aircraft (bomber and patrol) have been included.

To collect consistent data for these aircraft, a Mission/Design/Series (M/D/S) level of detail was required. Research showed that many M/D/S aircraft were (1) not produced, (2) produced only as Research and Development (R&D) aircraft, (3) produced only for Foreign Military Sales (FMS), or (4) converted from other series. Reference to Jane's All the World's Aircraft or to aircraft production acceptance figures maintained by the Office of the Assistant Secretary of Defense (Program Analysis and Evaluation) allowed these M/D/S aircraft to be identified and eliminated. Exhibit II-2 shows the M/D/S that were eliminated and the reasons for elimination.

The list of aircraft for which data were collected is shown on Exhibit II-3. Data for these aircraft are contained in Section IV. While 49 aircraft (M/D or M/D/S) were identified in Exhibit II-1, data were actually collected for 108 aircraft. The data collection is described below.

A. PHYSICAL AND PERFORMANCE DATA

The physical and performance data collected for the aircraft were limited in number. Given that the primary objective of the data collection effort was to produce a consistent set of cost data to relate to TASCFORM-AIR performance measures, collecting detailed physical and performance data was not warranted at this time. However, the preliminary data collected sets the

Exhibit II-3. M/D/S AIRCRAFT INCLUDED IN THE HANDBOOK (SECTION IV)

stage for future expansion of the handbook. These data are displayed in Section IV in the following categories:

- Manufacturer,
- Wing Type (Fixed/Rotary),
- Aircraft Type (CTOL/VSTOL/STOL/Other),
- TASCFORM-AIR Airframe Performance (AP),
- TASCFORM-AIR Aircraft System Performance (ASP),
- Engine Designator,
- Number of Engines, and
- Service.

The physical characteristics data for all aircraft were obtained from unclassified sources, primarily Jane's All the World's Aircraft. In the case of several US Air Force aircraft, "Standard Aircraft Characteristics Charts" were used.

The values for Airframe Performance (AP) and Aircraft System Performance (ASP) were obtained directly from TASC. The methodology used to derive AP and ASP is described in detail in the TASCFORM-AIR methodology development report.^{7/}

B. COST DATA

The objective of the cost data collection effort was to obtain sufficient information to produce a consistent set of historical cost data for the aircraft of interest. Initially, MCR hoped to collect the following data:

^{7/}The TASCFORM-AIR Model, TR-1334-3, The Analytic Sciences Corporation, 1 February 1980.

- the production lot quantities by M/D/S aircraft by fiscal year;
- associated then-year Total Obligational Authority (TOA) costs of new procurements, modifications, and conversions;
- a breakout of the costs by major subsystem (airframe, engines, electronics, armament, and other);
- the research and development costs associated with each aircraft program; and
- some measure of aircraft operating and support costs.

These data were to be obtained directly from the Services. After initial discussions with the Service contacts, it became clear that some of the data could not reasonably be collected. Historical research and development costs, modification and conversion costs, and operating and support costs were not readily available from Service records. Consequently, the list of data to be collected was modified. The actual data collection effort focused on obtaining:

- the total production quantities by fiscal year for the M/D/S aircraft of interest;
- the total flyaway costs (TOA) by fiscal year associated with the production quantities; and
- the breakout of total flyaway cost into airframe, engines, electronics, armament, and other, where possible.

The collection of data from each Service is described below.

1. US Air Force

Air Force aircraft cost data were obtained from the Cost Analysis Division within the Directorate of Cost and Management Analysis, Office of the Comptroller of the Air Force. Data

for most of the M/D/S aircraft are maintained in historical summary records exactly as required. The historical records reflect aircraft production quantities and flyaway costs by M/D/S broken out by subsystem, in TOA dollars, by fiscal year. The only difference in cost reporting is that the Air Force uses the term "ordnance" which corresponds to the term "armament" in this handbook.

For certain aircraft, however, cost data had not been accumulated or were not complete in the summary records. In these instances, Air Force direction and guidance were provided enabling MCR to research secondary sources (e.g., aircraft budget estimates). Exhibit II-4 displays the USAF tactical aircraft for which secondary sources of cost data were used.

Cost data remains incomplete for seven USAF aircraft contained in this handbook: F-105D, F-105F, F-111A, F-111D, F-111E, FB-111A and F-4C. No source of cost data, broken out by major subsystem and consistent with the other USAF data, was discovered for these aircraft during the data collection effort. However, total flyaway cost data were available for all USAF aircraft.

Nonrecurring costs were reported separately for both the A-10A, F-15A, and F-16A aircraft. There is no way, other than by estimate, to distribute nonrecurring costs among the various cost categories. A detailed discussion of nonrecurring costs is presented in the next subsection on US Navy and Marine Corps aircraft. The A-10A, F-15A, and F-16A nonrecurring cost data are included in an exhibit referenced in that subsection (Exhibit II-6).

Exhibit II-4. SECONDARY SOURCES FOR USAF AIRCRAFT COST DATA

2. US Navy and Marine Corps

Navy and Marine Corps aircraft cost data were obtained from the Cost Analysis Division within the Office of the Assistant Commander for Systems and Engineering, Naval Air Systems Command. All aircraft cost data were extracted from the official Navy budget exhibits for aircraft (Exhibit P5). Over time there have been changes in the level of detail appearing on Exhibit P5 for cost reporting. However, there have been no changes in definitions that would lead to inconsistencies between Navy and other Service data.

Exhibit II-5 depicts the evolution within the Navy of reporting categories used in this handbook. Two points about the changes shown on Exhibit II-5 should be made. First, for the period FY51-FY55, costs were reported as unit costs. This required multiplying the unit costs by the number of aircraft procured to produce the subsystem and total flyaway costs for those years. Second, beginning with FY69, nonrecurring costs were reported separately for the first time; previously these costs had been included in the other categories. Thus, Navy aircraft data from FY69 to the present are inconsistent with pre-FY69 data. There is no way to identify, other than estimation, where the nonrecurring costs should be categorized. For this edition of the handbook, these costs have only been included in the total flyaway costs; they have not been reported in the other categories. This nonrecurring cost categorization

HANDBOOK DATA CATEGORIES	P-5 FY 1951 - 1955 (PER UNIT COSTS)	P-5 FY 1956 - 1968	P-5 FY 1969 - 1982

			NONRECURRING COSTS
TOTAL FLYAWAY	TOTAL FLYAWAY	TOTAL FLYAWAY	TOTAL FLYAWAY

Exhibit II-5. NAVY BUDGET EXHIBIT P5 REPORTING CHANGES

problem exists for eleven of the Navy aircraft examined. Exhibit II-6 includes these aircraft and the nonrecurring costs by fiscal year. Further analysis is required to remedy this reporting/categorization problem in the data. Generally, most nonrecurring costs are associated with the airframe and therefore one solution, although imprecise, would be to assign the non-recurring costs to this category.

One other aspect of the Navy data collection effort was the change in aircraft designations. Exhibit II-7 is a cross-reference from former to current designations for the older Navy aircraft contained in Section IV. For some aircraft, we have identified them by the current and the older, more widely known, designation (e.g., F-1B (FJ-2)).

3. US Army

Army aircraft cost data were obtained from the Office of the Comptroller, US Army Troop Support and Aviation Materiel Readiness Command (TSARCOM). These data (for attack helicopters only) were assembled at TSARCOM from historical Army budget documents and transmitted to MCR for inclusion in the handbook.

The same problem encountered with the Navy data, recurring versus nonrecurring costs, is also present with the Army data. Therefore, until a satisfactory method can be devised for assigning the nonrecurring costs to the subsystems, these costs have been included only in the total flyaway cost category. The nonrecurring costs for the AH-1S are also included in Exhibit II-6.

Exhibit II-7. CROSS-REFERENCE FOR NAVY AIRCRAFT DESIGNATIONS

4. Combined Mission/Design/Series

For a number of aircraft within a Mission/Design, the TASCFORM-AIR methodology yields a single AP or ASP measure for several Mission/Design/Series (e.g., the same value for F-4A and F-4B). This occurs because small changes in performance between M/D/S cannot be measured by TASCFORM-AIR. Thus, the performance improvements made to the F-4B over the F-4A were sufficiently small that the TASCFORM-AIR methodology could not distinguish them.

The problem, then, was to combine cost data to develop one cost value for each performance figure of merit. The solution was to treat related M/D/S as belonging to a single cost-quantity curve, as discussed in Section III. The years of cost and quantity data for these M/D/S were put in chronological order. If two lots exist for a single fiscal year, as when two M/D/S were produced concurrently, the data are ordered alphabetically by series (e.g., the F-4A comes before the F-4B).^{8/} The combined data were then processed exactly as the data for individual M/D/S. These combined data sets are also included in Section IV. Exhibit II-8 shows the complete list of individual and combined M/D/S included in Section IV.

The next section of the handbook discusses how the data assembled during the collection effort were incorporated into the data base contained in Section IV.

^{8/} This assumption may warrant further analysis; however, it is believed valid for TASCFORM-AIR cost-performance measurement purposes.

Exhibit II-8. INDIVIDUAL AND COMBINED M/D/S AIRCRAFT INCLUDED IN THE HANDBOOK (SECTION IV)

III. DATA DISPLAYS

In the previous section, the data collection effort was described. In this section, the transformation of the collected data to produce Section IV is described. For each individual and combined Mission/Design/Series aircraft (e.g., F-4D or F-4C/D) reported in Section IV, the following data are displayed:

- a limited set of physical and performance characteristics;
- aircraft cost data presented in then-year Total Obligational Authority (TOA) and in constant FY81 dollars; and
- calculated unit and cumulative average costs for airframe, airframe and engines, and total flyaway cost (if sufficient information is available).

Each display is discussed below.

A. PHYSICAL AND PERFORMANCE DATA

The physical and performance data described in Section II.A were formatted for each M/D/S aircraft as shown in Exhibit III-1. Other physical and performance data can be entered on these formats at a later date. Suggested candidates for addition include:

- airframe weight,
- engine thrust,
- maximum speed,
- gross take-off weight, and
- year of initial operational capability (IOC).

B. COST DATA

Exhibit III-2 shows a sample cost sheet from Section IV. Each cost sheet contains four "blocks" of data. These are:

Exhibit III-2. SAMPLE FORMAT OF AIRCRAFT COST DATA

- cost data in then-year dollars;
- the same cost data normalized to constant FY81 dollars;
- the average costs for each fiscal year; and
- the cumulative average costs.

Each of the four data blocks are discussed in detail below.

1. Then-Year Cost Data

The first block of data contains the then-year cost data collected from the Services. Costs shown are Total Obligational Authority (TOA) dollars, which are the amounts budgeted in a specific fiscal year. TOA dollars do not reflect actual expenditures in any given fiscal year.

For each fiscal year, the number of aircraft budgeted is shown. The total flyaway cost for that quantity of aircraft is also shown. In addition, the following components of flyaway cost, corresponding to aircraft subsystems, are displayed. These are:

- airframe,
- engines,
- electronics,
- armament, and
- other.

In some of the displays, the total flyaway costs shown do not equal the sum of the costs of the component categories. This happens for two reasons:

- component costs were not available, and hence are shown as "0.000," but total flyaway costs were available; or
- nonrecurring costs are included in the total flyaway cost, but could not be assigned to the component categories.

Both of these data conditions were discussed previously in Section II.

2. Constant Fiscal Year Cost Data

The second block of data contains the costs in constant FY81 dollars. The conversion of historical TOA data to constant dollars is accomplished by dividing TOA by a composite or outlay-weighted index:

$$\text{Constant Dollars} = \frac{\text{TOA}}{\text{Composite Index}} \times 100$$

Each service has a unique composite index. The composite indices are based on the OASD Comptroller deflator for major commodity procurement and Service outlay profiles. The deflator series is adjusted to FY81 as the base year (i.e., FY81 has a deflator of 100.00 percent). The composite indices can then be used to calculate directly the constant FY81 dollars as indicated above. Multiplication by 100 is required since the index is expressed as a percentage. The deflators and composite indices are shown in Exhibit III-3, and discussed in detail in Appendix A.

3. Fiscal Year Lot Average Costs

The third block of data shows the average costs of the aircraft budgeted in each fiscal year. These numbers are

FISCAL YEAR	DoD OUTLAY ^{1/} ESCALATION INDEX	COMPOSITE INDEXES ^{2/}		
		APN	APA	APAF
1945	16.73	18.96	20.37	19.49

NOTES: ^{1/} Major commodity index excluding pay and fuel; from OASD(C) DoD Deflators (Outlays), dated 31 January 1983.

^{2/} Computed using individual service outlay profiles; see Appendix A.

Exhibit III-3. DEPARTMENT OF DEFENSE DEFLATORS -
AIRCRAFT PROCUREMENT

are simple averages computed by dividing each fiscal year cost by the associated quantity. Note that engine, electronics, armament and other costs are per aircraft costs, and not per subsystem.

These averages do not necessarily correspond to production lots, since there may be several production lots in a single fiscal year. For this reason they are called "Fiscal Year Lot Average Costs," indicating that they are average costs for the entire fiscal year but regardless of actual production lots. These costs are used in calculating the unit cost curves, discussed later in the subsection on cost-quantity relationships (Section III.C).

4. Cumulative Average Costs

The final block of data contains cumulative average cost data for the cumulative average cost curves. For each fiscal year, the cumulative average costs shown are the average costs of all aircraft produced to date. Thus, the cumulative average for the first fiscal year is equal to the fiscal year average shown in the third block of data above. For the second fiscal year, the cumulative average cost is the sum of the costs (from the second data block) in the first and second fiscal years divided by the sum of the quantities in those fiscal years.

Mathematically, this relationship can be expressed as:

$$\text{Cumulative Average Costs}_i = \frac{\sum_{j=1}^i C_j}{\sum_{j=1}^i Q_j}$$

where:

i = the numbers of the fiscal years in the sequence

C_j = the cost in the j th fiscal year

Q_j = the quantity purchased in the j th fiscal year

Note that cumulative average costs are only meaningful when data are available for all years. If data are missing for a given fiscal year, the calculation of cumulative average costs is not performed for that year or subsequent years. In a very few cases, components of total flyaway cost are missing. In these cases, cumulative average total flyaway costs calculated from total flyaway costs are the only cumulative average costs displayed.

Also note that the cumulative average cost calculations do not include fiscal year lots that have been identified as being Research and Development (R&D) buys. This is also true for the unit cost calculations discussed later. Fourteen M/D/S have one or more R&D fiscal year lots. These are shown in Exhibit III-4. The data collected from the Services did not explicitly identify these fiscal year lots as R&D buys. However, reference to Jane's All the World's Aircraft and a Rand report, An Analysis of Weapon System Acquisition Intervals, Past and Present, permitted identification of these as R&D

M/D/S WITH R&D FISCAL YEAR LOTS	FISCAL YEAR	NUMBER OF AIRCRAFT

Exhibit III-4. R&D AIRCRAFT ELIMINATED FROM UNIT AND
CUMULATIVE AVERAGE COST CALCULATIONS

aircraft. These aircraft have been specifically identified in the data base in Section IV.

C. COST-QUANTITY RELATIONSHIPS

In developing consistent measures of cost, cost-quantity relationships are often used. Two measures, unit cost at a specified quantity and cumulative average cost at a specified quantity, are more prevalent than others. The original handbook contained only cumulative average cost displays; in this edition, the unit cost curve calculations are also presented.

The choice between a unit cost curve or a cumulative average cost curve is often made based on the application or analyst preference. The essential difference between the two curves centers around which curve is assumed to be log-linear, that is, which functional form is assumed to provide the best representation of the learning experience.. The results for both cost curves are presented without advocating a preference for one over the other.

1. Unit Cost Curves

Exhibit III-5 is a sample display of unit cost-quantity information that is contained in Section IV for each M/D/S aircraft or combined M/D/S aircraft. The display shows the values that define unit cost-quantity relationships for airframe costs, airframe plus engine costs and total flyaway costs. These learning curves were determined using regression analysis assuming the functional form:

$$C = AX^B \quad \text{or} \quad \ln C = \ln A + B(\ln X)$$

where:

$\ln$ = the natural logarithm function

C = cost of unit X

X = unit number.

The constant A represents the first unit cost shown in Exhibit III-5. The exponent B is related to the slope, or learning rate, of the unit cost-quantity curve. The slope, s, is related to B as follows:

$$B = \frac{\ln s}{\ln 2}$$

where s is expressed as a decimal (e.g., .90).

The data used in the regression is the lot average cost and a calculated lot midpoint. The lot average cost is calculated from:

$$\text{Fiscal Year Average Cost} = \frac{\text{Fiscal Year Cost } i (\text{Constant FY81 Dollars})}{Q_i}$$

where Q_i is the quantity for fiscal year i. The corresponding lot midpoint is calculated from:

$$\text{Lot Midpoint}_i = \left[\frac{\sum_{x=n+1}^{n+Q_i} x^B}{Q_i} \right]^{1/B}$$

where:

n = cumulative quantity produced to fiscal year i

B = learning curve exponent.

F-4D

UNIT COST CURVES

	CALC SLOPE	CALC FIRST COST	UNIT 100	R2

66	509	4.123	4.189	-.066	1.60

Exhibit III-5. SAMPLE FORMAT OF AIRCRAFT
UNIT COST CURVES

The calculated lot midpoint is seen to be dependent upon the learning curve exponent. For this reason, an iterative procedure is used in calculating the unit learning curve values.

The procedure is:

- calculate an initial estimate for B using arithmetic mean values for lot midpoints;
- calculate lot midpoints from the equation above using last estimate for B;
- calculate a revised estimate for B using new lot midpoints; and
- repeat the previous two steps until the two values for B agree within a small error (e.g., .0001).

The results from the last regression are used for the first unit costs and slopes shown in Exhibit III-5.

Also shown in the exhibit are the 100th unit costs, shown as Unit 100, for the three cost curves. The coefficient of determination, or R^2 , for each curve is shown. This figure indicates the fraction of variation explained by the unit curves "fit" to the actual data. Values for R^2 fall between zero and one, with higher values indicating a better fit to the data.

The remaining data groupings of Exhibit III-5 show by fiscal year:

- the plot point quantity (the calculated lot midpoint),
- the actual lot average cost,
- the calculated lot average cost,
- the difference, and
- the percent difference.

2. Cumulative Average Cost Curves

Exhibit III-6 is a sample display of cumulative average cost-quantity information for each M/D/S aircraft. The display shows the values that define cumulative average cost curves, in contrast to unit cost curves, for airframe costs, airframe plus engine costs, and total flyaway costs. Cumulative average cost curves were determined using regression analysis techniques assuming the functional form:

$$C_Q = A Q^B \text{ or } \ln C = \ln A + B(\ln Q)$$

where:

$\ln$ = the natural logarithm function

C_Q = cumulative average cost for a quantity Q

Q = cumulative quantity

The constant A is the first unit cost, also shown in Exhibit III-6.

The constant B is related to the slope, or learning rate, of the cost-quantity curve (also shown in Exhibit III-6). We can determine the slope from B in this way:

$$s = 2^B \text{ or } B = \frac{\ln s}{\ln 2}$$

where:

s = slope expressed as a decimal (e.g., .90).

Exhibit III-6. SAMPLE FORMAT OF AIRCRAFT
CUMULATIVE AVERAGE COST CURVES

In addition to the slope and first unit cost, Exhibit III-6 shows the cumulative average cost at Unit 100, shown as CAC(100), for the three cumulative average cost curves: airframe, airframe plus engine, and total flyaway costs. Also shown is the coefficient of determination, or R^2 , value for the regression through the cost-quantity data (discussed previously for the unit cost curves).

The remaining three data groupings of Exhibit III-6 show the actual quantity and cost data by fiscal year, and the cost that would be estimated using the cumulative average cost curves. The difference between the actual and estimated values are shown, and the percent difference is displayed.

IV. AIRCRAFT DATA

This section displays the aircraft cost and performance data discussed in the previous sections. The aircraft are presented in the order shown below.

1. A-1E	27. AH-1J	53. F/AF-1E(FJ-4/4B)	79. F-9F/H	105. F-104B

Exhibit IV-1. INDIVIDUAL AND COMBINED M/D/S AIRCRAFT

For each individual and combined M/D/S aircraft, the following data are displayed:

- physical and performance characteristics;
- aircraft cost data presented in then-year TOA and in constant FY81 dollars;
- calculated unit costs for airframe, airframe and engines, and total flyaway cost (when sufficient data are available); and
- calculated cumulative average costs for airframe, airframe and engines, and total flyaway cost (when sufficient data are available).

APPENDIX A.

ESCALATION INDEX TABLES

I. INTRODUCTION

This appendix contains tables of inflation rates, escalation factors and composite escalation/outlay factors for the following Service appropriation accounts:

- Aircraft Procurement, Army (APA),
- Aircraft Procurement, Navy (APN), and
- Aircraft Procurement, Air Force (APAF).

This introduction provides an overview of the escalation indices, Section II provides a more detailed description of the indices and how they are constructed. Section III provides detailed instructions for use of the indices.

At the end of this introduction, the individual appropriation tables are presented accompanied by the outlay profiles from which they were derived (i.e., Exhibits A-1 through A-6). US government fiscal years 1945 through 1999 are covered in the tables, including the 1976 transition quarter 197T. The tables are based on Fiscal Year (FY) 1981 and all index numbers are related to FY81 constant dollars. The computer program used to generate these tables can generate equivalent tables for any base year from 1945 through 2014 to meet special requirements. The composite indices of these three tables were used to normalize aircraft procurement costs of the respective Services into FY81 constant dollars.

The inflation rates from 1945 through 1981 represent historical data for major commodity procurement as compiled by

the Office of the Assistant Secretary of Defense (Comptroller). Inflation rates from 1982 onward represent current DoD estimates.

The outlay profiles for Army, Navy and Air Force aircraft procurement appear in Exhibits A-4, A-5, and A-6, respectively. The outlay profiles for the Army and Air Force represent historical data back to 1974 while the Navy profiles go back to 1972. The earliest available profile for each Service appropriation was used for all prior years of that appropriation. Future years profiles from 1982 onward are DoD estimates. Since the profiles extend for four years beyond the budget year, portions of the 1978 through 1981 profiles must necessarily also be DoD estimates.

The tables for APA, APN and APAF reflect the latest available DoD Deflators (Outlays) and the appropriate Service appropriation outlay profiles. The tables reflect:

- Department of Defense Deflators (Outlays), 31 January 1983 (Historical deflators from 1945 to 1980);
- Outlay Rate File, Navy Appropriations, January 1980 (Historical profiles for Navy appropriations); and
- Report 3, Cumulative Expenditures as Percentage of Ultimate Expenditure Estimate, 16 February 1982 (Historical and estimated profiles for all Service appropriations from 1974 onward).

II. DESCRIPTION OF THE INDICES

This section describes the escalation and composite escalation/outlay tables. The sources of data for the tables are described. The method of using the inflation indices and corresponding outlay profiles to arrive at composite escalation/outlay indices is explained.

A. INFLATION RATES

The escalation indices contained in this appendix have been constructed using DoD Deflators (Outlays), which is a generally accepted source for use in DoD cost analysis and estimating. These deflators are updated periodically by the OASD (Comptroller). Current editions of these deflators were obtained directly from that office to assure the proper linkage of currently estimated future inflation rates with past historical data.

The inflation rates for each fiscal year in the indices represent the percent inflation as of mid-fiscal year compared to the previous mid-fiscal year. The escalation factors represent the price level at mid-fiscal year compared to the price level of the selected base mid-fiscal year, expressed as a percentage.

B. OUTLAY RATES

The outlay rates used in computing the composite escalation/outlay factors are determined from data compiled on historical appropriation outlays. To this are added estimates of future

appropriation outlays to arrive at annual outlay profiles. The factors represent the fraction of a given year's appropriation authorization that was, or is expected to be, paid out (outlayed) in the budget and following fiscal years. The earliest available outlay profile for a given appropriation is used for all prior years. This approximation is necessary since historical data are not available for the earlier years.

C. COMPOSITE INDICES

Outlay profiles for future years are based on the premise that appropriations are not paid out (outlayed) in a single year, but exhibit an outlay profile over a period of years that is characteristic of the appropriation. The estimated profiles for future years are based on historical patterns. Adjustments may be made for current procurement practices and consistency with overall government policy. In order to assure that an appropriation is large enough to cover escalation, it is assumed that the funds will be outlayed in accordance with the profile and necessary inflation amounts are added for each year of the profile. The sum of all amounts over the years of the profile becomes the budget dollars for that budget year. The composite escalation/outlay factor does this with a single calculation. By using the composite escalation/outlay factors, base-year dollar amounts are converted to budget dollars (i.e., adjusted to account for inflation up to the budget year, and for each year of the outlay profile thereafter). Conversely,

budget dollars for future years can be deflated to desired base-year dollars by using the composite escalation/outlay factors.

Past appropriations were outlayed over a period of years and the profiles have been calculated. The annual inflation rates have also been determined, permitting the calculation of composite escalation/outlay factors. The composite escalation/outlay factors for prior years enable the analyst to strip the effects of inflation from a past appropriation, converting it from budget dollars to base-year dollars.

The tables displayed in Exhibits A-1 through A-3 permit the cost analyst to convert back and forth between FY81 constant dollars and budget dollars in any desired year. By multiplying by the ratio between base-year factors, the conversions can be extended to any other year included in the tables.

D. FISCAL YEARS

Prior to July 1976, US Government fiscal years began on 1 July and ended the following 30 June. The fiscal year began six months prior to the corresponding calendar year. The 3-month period 1 July 1976 to 30 September 1976 is referred to as the transition quarter. It is variously designated as 1976TQ, 1976T or, as in this report, 197T. Government fiscal years now begin on 1 October (three months prior to the corresponding calendar year) and end the following 30 September.

E. TRANSITION QUARTER

The inflation rates, escalation factors and composite escalation/outlay factors are all based on mid-fiscal year values. In the case of the transition quarter, 197T, they are based on mid-quarter. Since no time factor is involved in calculation of inflation rates, no adjustment is needed for the 197T and 1977 inflation rates that appear in the tables. To annualize these rates, however, both must be adjusted by a factor of 1.6 (the ratio of 12 months to 7 1/2 months).

III. INSTRUCTIONS

Detailed instructions for use of the escalation and escalation/outlay tables are given in this section.

A. USE OF TABLES

All escalation and composite escalation/outlay factors are expressed in percentages. To use the factors in converting dollar amounts by multiplying or dividing requires that they be in decimal form. For example, the base year escalation index of 100.00 should be expressed as 1.0000. Composite factors of 40.32 and 151.35 should be expressed as 0.4032 and 1.5135 respectively.

In making any conversions, locate the table for the appropriation under study. Conversions are made as follows:

- To Convert Base-Year Dollars to Constant Dollars
 - multiply the base-year dollars by the escalation index factor for the year into which the dollars are to be converted.
- To Convert Constant Dollars to Base-Year Dollars
 - divide the dollars by the escalation index factor for the year in which the constant dollars are expressed.
- To Convert Base-Year Dollars to Budget Dollars
 - multiply the base-year dollars by the composite escalation/outlay factor for the desired budget year.
- To Convert Budget Dollars to Base-Year Dollars
 - divide the budget dollars by the composite escalation/outlay factor for the budget year.

B. OTHER BASE-YEARS

It may be necessary to make conversions into base years other than FY81. In such cases, use the following procedure:

- Select the table for the desired appropriation.
- Determine the base-year conversion factor by dividing the escalation index for FY81 by the escalation index for the desired base year.
- Multiply all escalation and composite escalation/outlay factors taken from the table by the base-year conversion factor.
