SUMMARY

A survey of the power conditioning market has been conducted to determine the availability and characteristics of electrical power conditioning equipment, both solid state and rotating. Sources for the survey were sought through synopsis in the Commerce Business Daily as well as direct mail requests and contacts with Belvoir Research and Development Center Foreign Liaison Offices and foreign embassies. The survey was conducted by means of a questionnaire furnished to prospective sources. Data from the survey are summarized in this report. The survey data show that general purpose, multifrequency, multivoltage power conditioners are not presently available. Most single-frequency-in, single-frequency-out combinations of standard voltage and connections are supported, however. Few units are designed for the military environment, and little attention has been devoted to minimizing size and weight.

POWER CONDITIONING EQUIPMENT

AVAILABILITY SURVEY

I. BACKGROUND

A TRADOC/DARCOM Letter of Agreement (LOA) for a Family of Military Power Conditioners established a requirement and an operational concept for the use of electrical power conditioners by Army field units. This LOA is included as Appendix A of this report. The family of power conditioners as envisioned by the LOA would consist of eight units in ratings from 1.5 kW to 200 kW, coinciding with the ratings of the DOD standard family of Mobile Electric Power Sources. The units would be used to condition power for tactical systems, supply uninterruptible power as required, and to supply general purpose power in semi-fixed locations from sources of incompatible power. They would be capable of voltage and frequency conversion as well as upgrading of power quality. As one step in the definition of a program to provide this capability, Belvoir Research and Development Center has been requested by DOD Project Manager-Mobile Electric Power (PM-MEP) to identify the types and characteristics of power conditioning equipment available on the commercial market for potential procurements as Military-adapted commercial items or as non-development items within the range of ratings stated.

II. OBJECTIVES

This survey of the commercial market has been conducted to determine the availability of power conditioning equipment and to compare characteristics of that equipment with requirements of the LOA. It encompasses all types of power conditioning equipment: converters, inverters, frequency changers, line conditioners and uninterruptible power supplies. Both rotating and solid state equipment are included. The following functional definitions of equipment types are used within this report: (1) *converters* accept a.c. or d.c. input and provide d.c. output; (2) *inverters* accept d.c. input and provide a.c. output; (3) *frequency changers* accept input at one or more a.c. frequencies and provide output at one or more different a.c. frequencies; (4) *line conditioners* accept a.c. input and provide a.c. output at the same frequency with enhanced voltage regulation of the line and transient or noise suppression; (5) *uninterruptible power supplies* (UPS) provide no-break power from a separate a.c. or d.c. energy source during disruption of the primary supply.

III. APPROACH

The survey was undertaken by means of a questionnaire sent to prospective sources. A copy of the questionnaire is included as Appendix B and a copy of the cover letter, as Appendix C. Sources were sought through a synopsis published in the Commerce Business Daily (CBD) on 17 December 1982. A copy of the synopsis is included as Appendix D. In addition to those sources responding to the CBD synopsis, copies of the questionnaire were sent to companies otherwise known to be active in the field. Contacts were also made through the Belvoir Research and Development Center Liaison Offices for possible sources in Australia, Britain, Canada, France and Germany. A list of sources to whom the questionnaire was sent is included as Appendix E.

Responses to the questionnaire were used in assembling this report. In some cases, companies provided brochures or product data sheets in addition to or instead of the questionnaire. In those cases, information was transferred where possible to the questionnaire format for use in analyzing responses. The citation of manufacturers and trade names of commercially available products does not constitute official endorsement or approval of the use of such products. Every effort has been made to report accurately the data furnished. However, no liability is assumed.

The questionnaire solicits information concerning technical performance of the equipment and its availability and cost. A brief summary follows:

Section 1 asks for the manufacturer's name.

Section 2 requests data on the basic configuration of the equipment such as input/output connections, frequency, power, size and weight, and UPS capability.

Section 3 asks for the technology(ies) utilized. It is intended to determine general techniques and components such as the use of SCRs or transistors, step wave inverters, ferroresonant transformers, high frequency switching, etc., rather than proprietary details of the equipment design.

Section 4 requests electrical performance specifications with regard to voltage and frequency regulation and modulation, harmonic distortion, and phase relationships.

Section 5 requests limitation of the equipment with respect to outside effects such as load power factor, short circuit, and fluctuations at the input line.

Section 6 asks for ambient operating conditions including temperature and elevation limits, electromagnetic and nuclear radiation hardness, and protection against an outdoor environment.

Section 7 requests information on operation, reliability and maintainability and requests such data as efficiency, noise level, MTBF, and use of high reliability parts.

Section 8 requests information on controls, instrumentation and protection, and conformance to safety standards.

Section 9 requests cost and production data.

IV. RESULTS

The results of this survey are presented in the form of tables listing selected data for each model of power conditioning equipment reported, as discussed below. A concerted effort has been made to obtain information on all power conditioning equipment currently in production and being marketed.

In the process of gathering the data in this report, 58 U.S. and 17 foreign companies were queried (see Appendix E). Information obtained from the respondents encompasses more than 460 models of power conditioning equipment. The responding companies and the reported items of equipment are considered to be a good representation of the power conditioning field at this time as to the range of cost, size, weight, environmental factors, voltages, frequencies, and electrical performance.

For the purposes of this report, power conditioning equipment has been separated into the following functional categories as defined in Section II: UPS, Frequency Changers, Inverters, Converters, and Line Conditioners. Within these categories, units are grouped by power rating into four ranges: 0 kW to 5 kW, 5 kW to 15 kW, 15 kW to 60 kW, and greater than 60 kW.

V. DATA

Selected data for each model are reported in Tables 1 through 5. The tables present characteristics of the equipment which are considered most important for military applications. In addition to company name and model designation, the characteristics include: input and output voltage, frequency and phase, size and weight, output voltage regulation, frequency regulation and total harmonic distortion, and environmental tolerances. The data shown are as provided by the sources. In cases where data sheets were furnished instead of completed questionnaires, data were extracted from the sheets. Blanks indicate that the data were not provided. Unless otherwise specified, dimensions are in

inches and weight in pounds. In cases where more than one input or output voltage is shown as being available, the word "or" indicates that a selection may be made when specifying the unit; "and" indicates that the combination is furnished on the unit as delivered. Power rating is given in kVA. Most units allow for at least 0.8 power factor, lagging.

1. Line Conditioners (Table 1). Line conditioners are used primarily for transient and electrical noise suppression and for a degree of voltage regulation of input power to sensitive equipment. These functions are accomplished through such techniques as filtering, use of transient energy absorbers (MOVs, Transorbs, etc.), and ferroresonant and step-changing transformers. No control of frequency (or frequency changing) is provided. The models reported are not designed for rough handling or harsh environments.

2. Inverters (Table 2.). Inverters are used to develop an a.c. output from a d.c. source. (Thus, solid state UPS systems and frequency changers typically include an inverter section.) The inverters reported in this group are configured as stand-alone systems. Included in the group are units designed for aircraft power systems and fuel cell and solar photovoltaic systems. Weight to power ratios are shown in Figure 1.

The aircraft inverter technology appears promising. At the 1-kVA level, Avionic Instruments produces 50-Hz, 60-Hz and 400-Hz models (Nos. 3A1000, 2A1000, and 1B1000, respectively) with weight to power ratios of about 13 lb/kVA. These units are rated for a wide temperature range (-55°C to $+71^{\circ}\text{C}$) and for high altitude (55,000 ft) operation. Voltage and frequency regulation of the 3A1000 model are within the precise power definition of MIL-STD-1332. As manufactured and distributed, each of the Avionic Instruments units provide only single-frequency/single-voltage output. Leland, also, has models with weight to power ratios in the 13 lb/kVA to 17 lb/kVA range at ratings of 1 kVA to 3 kVA which have operating temperature ranges of -55°C to $+71^{\circ}\text{C}$ and altitude to 55,000 ft. Bendix Model 32827-10 is a motor-generator (MG) type inverter with a weight to power ratio of 15 lb/kVA and an operating temperature of -55°C to $+85^{\circ}\text{C}$.

Aerospace Avionics Model SVS 500 (0.5 kVA) has 60-Hz and 400-Hz output but with a narrower temperature range (0°C to 50°C). DECC Model 61098 has a weight to power ratio of 29 lb/kVA with 60-Hz and 400-Hz output. This model was specifically developed for the MERADCOM fuel cell program. The Powertronics unit has variable output frequency but is part of a system and is not available as a separate unit.

3. Converters, a.c. to d.c. (Table 3). The a.c. to d.c. converters are used to generate a regulated d.c. output from an a.c. source. Battery chargers, d.c. power supplies, and transformer rectifier units are examples of this function. Although the Goodall units conform to military specifications, they do not appear as outstanding candidates for Army tactical applications because of weight to power ratio (60 lb/kVA to 200 lb/kVA) and narrow operating temperature range (23° C to 50° C). The Aerospace Avionics unit has a narrow temperature range (0° C to 50° C). The Bendix units have power to weight ratios of about 3 lb/kVA; these are 400-Hz units.

4. Uninterruptible Power Supplies (UPS) (Table 4). UPS are used to provide an unbroken supply of power for critical equipment or functions during temporary interruption of the primary power source. A complete UPS system includes a standby source of power to provide this no-break capability. The duration of the interruption during which the UPS system can provide power is determined by the energy capacity of the standby source (in relation to the load/power requirements). An UPS capability is of major importance to some military systems as represented by the power line conditioner in the communication system control element being developed by PM TRITAC.

A typical UPS system may consist of a rectifier/battery charger section operating from the primary a.c. supply, a battery bank which serves as the standby energy source, and an inverter section to provide a.c. power of suitable quality to the load, operating either from the rectified input or the battery bank. Such systems typically find use in critical computer systems or for solar power backup.

In the power range of less than 5 kW, none of the units reported has characteristics which are especially useful for military field applications. The operating temperature ranges are narrow (e.g., -10°C to $+40^{\circ}\text{C}$ is the widest range.). The weight to power ratios are in the 10^2 lb/kVA range. Voltage regulation is not within MIL-STD-1332 requirements for precise power, although frequency regulation is within that specification. Most models have voltage regulation within the 4-percent utility power definition. All the units are single frequency in and out.

In the 5-kW to 15-kW range, the same comments apply with the exception that Gould systems such as 6156-X and Exide systems such as 2710 have voltage regulation of 1 percent, which complies with MIL-STD-132 for precise power.

In the power ranges 15 kW to 60 kW and 60 kW and above, there are several models by Gould, Teledyne Inet and Elgar which meet the precise power voltage and frequency regulation specifications of MIL-STD-1332. These models are single frequency in and out and are specified for an operating temperature range of 0° C to 40° C by Gould and Teledyne and 0° C to 50° C by Elgar. Teledyne Inet states that its models (series 75 through 500) are not adaptable to field use in rough terrains.

Basically, these units are intended for fixed installation and are for single-purpose applications. Weight to power ratios are shown in Figure 2 (these figures do not include the standby energy source.).

Figure 2. Weight to power rating ratio of uninterruptible power supplies vs power rating.

5. Frequency Changers (Table 5). Frequency changers are used to convert power available at one frequency to a different frequency required by the using equipment. Examples include supply of 400-Hz aircraft power from 60-Hz ground sources or conversion of 50 Hz to 60 Hz for equipment utilization in Europe and other OCONUS Theaters. The equipment reported here falls into two general categories: solid state static changers such as rectifier-inverter combinations and rotating machinery, such as motor-generator (MG) sets.

As a class, the MG sets tend to be heavier at a given power level than the solid state units, as shown in Figure 3. A similar relative trend is seen in the volume data, as shown in Figure 4.

The MG sets reported here are designed for single frequency in and out. In many cases, the output frequency is not controlled: In units based on synchronous machines, variations in the input frequency appear at the output. Except for d.c. motor control, this type of equipment does not lend itself to multi-input frequency designs.

Solid state systems in this category are designed for single frequency in and out, almost exclusively. A few solid state systems allow for a choice of frequency on order. They are intended for single-purpose application.

In the less than 5-kW power range, one unit from Teledyne Inet (CV-3231/V2) is built to military specifications. However, voltage regulation is ± 4 percent, outside precise requirements of MIL-STD 1332 but within the 4-percent utility power definition. Its weight to power ratio is about 40 lb/kVA. The operating temperature range is -33°C to $+52^{\circ}\text{C}$. Nova Electric models such as FC12XX allow a range of input frequencies. California Instruments Models such as 3001TC permit a range of input and output frequencies. These units are, essentially, laboratory power supplies.

Figure 3. Weight to power rating ratio of frequency changers vs power rating.

Figure 4. Volume to power rating ratio for frequency changers vs power rating.

In the power range from 5 kW to 15 kW, one unit from A.L.S. Corp. (Model SMG-15M) is built to military specifications with an operating temperature range of -34 to $+53^{\circ}\text{C}$. Voltage and frequency regulation are within the precise specification of MIL-STD 1332. Input frequency range is 45 Hz to 65 Hz with an output at 400 Hz. Weight to power ratio is 55 lb/kVA. Powertronic Systems has a unit at 15 kVA with weight to power ratio of 10 lb/kVA, somewhat lower than average at that power level. According to Powertronic Systems, this unit is not marketed at present. The same comments as before apply to California Instruments models.

In the 15 kW to 60 kW power range, none of the units stand out. The A.L.S. models meet the voltage and frequency regulation requirement for MIL-STD 1332, but the operating temperature range is 0 to 40°C . Weight to power ratios are about 15 lb/kVA for 400 Hz units and about 40 lb/kVA for 60 Hz units. The Teledyne Inet MG sets which have operating temperature ranges extending to about -40°C (MMG IA and MD4) are limited to having output frequency regulation synchronous with the input. Nova Electric has models such as FC20K3/X which allow a range of input frequencies.

In the power range greater than 60 kW, Teledyne Inet has some solid state units intended for shipboard power (AC68 thru 160). However, Teledyne states that these models are not adaptable to field use in rough terrain.

Although more flexible than other units, these units which allow a range of input frequencies are not general purpose, since multiple input voltages are not similarly available on the same units.

VI. COST INFORMATION

Only a limited amount of cost information was obtained through this survey. Where available, the cost (and cost/VA) is shown with the model designation on the data sheets. These data are displayed in the form of cost per VA versus rating in Figure 5. There is a range of approximately \$2.00/VA to \$4.25/VA in the low (<5) kVA ratings. The range tends to narrow at higher ratings and the trend, as expected, is to lower cost per VA at higher ratings (\$1.00/VA at 60 kVA). The spread is due to a number of factors including technology type, production methods, and sales, which are difficult to separate or define based on the available data.

The data are displayed in the form of cost/pound vs rating in Figure 6. At the low kVA ratings the scatter is quite large, and it is difficult to draw any conclusion. At ratings above 10 kVA the scatter is smaller, and the values are in the range of \$10/lb to \$15/lb.

Even fewer data were provided for unit cost vs quantity purchased. Those data available are plotted in Figure 7 (see, also, Table 6). Unit price has been normalized to unity at 500 units. The ordinate, then, is the relative unit cost and the abscissa is the number of units purchased. These data show that a change in the range of 9 percent to 23 percent in unit price can be expected when the purchased quantity changes from 50 units to 500 units. For two families (the upper curves), the data indicate a change of about 38 percent in unit price between 50 units and 500 units. (The smooth curves are drawn to guide the eye of the viewer; they do not represent a functional fit to the data.)

VII. CONCLUSIONS

- This survey has not located any general purpose (multi-frequency, multi-voltage, transportable, environmentally protected) power conditioners.

- Essentially all systems are single-frequency in, single-frequency out; all combinations of standard (50-Hz, 60-Hz, 400-Hz) frequencies seem to be supported.

- Most units allow only limited or no input and output voltage reconnection. Many units provide a choice of standard connections on order.

- With the exception of aircraft inverter technology, little emphasis has been given to size and weight constraints.

- Few units are designed for operation over the military temperature and altitude range.

- The categories of frequency chargers and uninterruptible power supplies are fairly well represented across the power ratings from 1-1/2 kW to 200 kW. The categories of inverters and converters are primarily represented in the lower power ranges.

LETTER OF AGREEMENT
FAMILY OF MILITARY ELECTRIC POWER CONDITIONERS (PC)

1. NEED:

a. The Army has a critical need in the 1985-1995 timeframe for a capability which will meet its increasing electrical power requirements and reduce the logistical burden associated with current approaches for conditioning the required energy. Increasing technical requirements including low acoustical and infrared (IER) signatures have been imposed on military power systems by the development of modern equipment such as computers, communications systems, target acquisition and fire control systems. Tactical power requirements for the Army require provision of such varied forms of power as: direct current (DC) and alternating current (AC) at 50/60 HERTZ (HZ), 400 HZ and 60 HZ only; single phase and three phase power; closely controlled frequency/voltage (precise power) from 28 volts DC to 460 volts AC; and uninterrupted power source (UPS) (no break power) in a range of power ratings from 1.5 kilowatts (KW) to 200 KW. Standardization efforts by the DOD Program Manager for Mobile Electric Power (PM-MEP) have reduced the types and numbers of generators for providing the required power to a minimum; however, some forms of power require costly special purpose generators. In order to provide both standard (utility) and precise power, the current system must use a utility and a precise power generator. The use of a family of power conditioners (PC) could significantly reduce, if not eliminate, the need for costly special purpose generators, thereby achieving substantial logistical savings. Power conditioners located with power consuming equipment could produce additional savings because the generator and/or distribution power ratings could be reduced through use of lower distribution frequencies or shorter distribution distances.

b. Catalog of approved requirements documents reference number:

2. OPERATIONAL CONCEPT:

a. The members of the family of electric power conditioners will be employed to condition power for tactical weapons systems in the field and for general purpose power requirements in semi-fixed locations. Employment with tactical weapons systems will require power equipment with small size, light weight and a high degree of mobility. Employment with systems in semi-fixed locations will require power equipment with increased operating life. Power conditioners can be used by all units having requirements for diverse forms of special purpose electric power in any area of the theater of operations. The family of electric power conditioners must be capable of specified performance at rated loads comparable to the special purpose generators which will be replaced. This family concept has been reviewed by the ABCA Standardization Program and other services.

b. Mission profile is attached as Annex A.

3. SYSTEM DESCRIPTION:

a. The family of electric power conditioners will consist of eight (8) solid state PC units in ratings between 1.5 KW and 200 KW to match the DOD standard family of Mobile Electric Power Sources (MEPS). Each individual power conditioner will be designed to be significantly smaller than the equivalent standard MEPS, e.g.: size - one to one hundred cubic feet, weight - 60 to 3,000 pounds, transportability - able to be transported by truck, trailer, helicopter or fixed wing aircraft as well as by, rail and marine craft. A separate operator will not be required after initial installation, except to change air filters.

b. Installation will insure that each PC unit will provide a suitable interface between an available power source and a load power requirement regardless of load or power source characteristics. The PC will be reconnectable in voltage and phase at both input and output; will provide for frequency conversion; and will be compatible with a no break or uninterrupted power source (UPS) requirement when connected to external storage batteries, fuel cells, commercial power or other auxiliary power sources to replace the prime power source. UPS is herein defined as the capability of providing steady-state power for a limited time within acceptable tolerance bands without damage to the power consuming equipment after prime power source failure occurs.

c. Reliability, availability and maintainability (RAM) is critical to the cost and operational effectiveness of the PC. Appropriate RAM requirements will be included in the PC Required Operational Capability (ROC).

d. Electronics Counter Measure/Counter-Countermeasures and Safety and Human Engineering considerations must be included in the design in accordance with applicable specifications.

e. Nuclear survivability is required and the system must be designed and constructed to survive the set of nuclear effects levels which will be stated in the outline acquisition plan and the key documents that lead up to this plan such as the Concept Formulation Package and the appropriate test plans.

f. To facilitate chemical agent decontamination, chemical agent resistant materials will be used to the maximum extent practicable in the development of this item.

g. This item will be painted with chemical agent resistant paints to facilitate chemical agent decontamination.

h. Personnel must be able to successfully perform their mission in

an NBC environment. This includes individual operations wherein personnel are clothed in their appropriate chemical/biological protective ensemble.

i. This family concept lends itself for other service or allied nation interest.

j. The system may be palletized, skid mounted or banded and will be transportable to and within the theater by highway, rail, marine and air transport. Suitable lifting and tie down devices will be provided as required.

k. All PCs must operate normally in climatic categories 1 through 6 without winterization kits.

l. All PCs must operate normally in climatic conditions 7 through 8 with winterization kits.

4. PROSPECTIVE OPERATIONAL EFFECTIVENESS AND COST:

a. The family of PCs should be able to reduce the logistics support necessary to provide electrical power in any tactical situation. This is done by reducing the need for low density special purpose generators and with the substitution of low cost tactical utility (TU) generators supplemented with PCs to meet diverse utility and precise power consuming needs required by weapons systems, maintenance shelters, or command posts. Employment of PCs in a tactical situation will reduce infrared (IR) or acoustical noise signatures over equivalently rated electrical generators, motor generator sets, rotary converters or inverters. In a peacetime situation where low acoustical noise is required, the PC can be used to convert commercial or foreign utility power sources to the proper voltage and frequency required probably at a lower cost over the use of tactical generators. These system capabilities can be achieved with no increase in crew size or logistic support requirements, probably at reduced cost relative to present systems.

b. Unit Flyaway Cost. Broad based estimates of unit flyaway cost expressed in constant FY78 dollars is \$1592 for the 1.5 KW PC, \$2684 for the 3 KW PC, \$3264 for the 5 KW PC, \$14,338 for the 10/15 KW PC, \$16,644 for the 30 KW PC, \$23,982 for the 60 KW PC, \$38107 for the 100 KW PC and \$60,514 for the 200 KW PC.

c. Manpower savings should result since there will be no increase in operator requirements and a potential decrease in annual maintenance man hours. Forecasted reduction in operator/maintenance man hours is envisioned by standardization of generators and an anticipated reduction in the inventory of special purpose generators.

5. SYSTEM DEVELOPMENT:

a. Operational Employment Plan: Commander, HQ TRADOC with input from HQ DARCOM will conduct the necessary studies, war games, test and evaluations to define the operational concepts. A system unique event that must be addressed by the combat developer and materiel developer is if the PC can provide military units with the conditioned power in required amounts and characteristics needed for mission accomplishment.

b. Technical Development Plan: The following system unique events will be addressed by the materiel developer:

(1) A study of frame sizes to determine whether the number of proposed ratings of the family of power conditioners can be changed or reduced to meet user needs.

(2) Establish whether the order of developments of individual ratings is optimal for maximum transfer of technology.

(3) The Combat and Materiel Developers will jointly develop RAM requirements for inclusion in the subsequent ROC or LR. Together they will develop a RAM Rational Annex that justifies and supports the quantitative RAM requirements. As a minimum, the RAM Rational Annex will contain the operational mode summary/mission profile, failure definition/scoring criteria, baseline analysis historical data, and definitions of RAM terms that are unique to this materiel.

(4) RAM will be a critical test issue for DTI and OTI.

c. Logistics Support Plan: The Combat and Materiel Developers will jointly conduct appropriate analysis and planning effort to assure that:

(1) System design is such that Logistic Support, manpower and skill requirements are not increased beyond the capabilities of presently assigned MOS personnel.

(2) RAM requirements are sufficiently high to assure that the Logistic Support burden will not be increased with the addition of the item to using unit TOEs.

d. Training Support Concept:

(1) The materiel developer, in coordination with the TRADOC proponent, will develop a detailed training subsystem capable of providing a complete transfer of knowledge from the developer to the system user and maintainer. This training subsystem will be based upon a precisely defined set of performance requirements obtained through analysis or collection of Logistic Support Analysis (LSA) data generated IAW DARCOM Pam 750-16 or MIL-M3035, as appropriate. Based on the results of this analysis, DARCOM/TRADOC will jointly agree upon a detailed task list covering all operator and maintenance difficult to train tasks for the system. The identification of and agreement on these tasks will be a formal, identifiable milestone in the validation phase of development. Tasks so identified will be incorporated into a signed agreement and into the system outline acquisition plan.

(2) TRADOC will describe the user population to the materiel developer and assist the materiel developer in identifying any unusual training requirements inherent in the intended user population.

(3) The DARCOM materiel developer will develop an outline of each TM to be produced, and preliminary draft documentation and storyboard training materials for tasks selected for training IAW approved Skill Performance Aids (SPAS) specifications. Deliverable products for DT/OT I will be determined between DARCOM and TRADOC on a case-by-case basis. The draft documentation and training produced as a result of this determination will be used to train operator/crew and maintenance personnel representative of the user population for OT I.

(4) The need for training requirements and materials, such as class room trainers or collective trainers, which are not identified as a result of the SPAS work effort, will be investigated. The necessary TRADOC/DARCOM responsibilities and resources to develop these training materials will be established and requirements will be included in the ROC or separate requirement documents, as appropriate.

(5) TRADOC will develop an outline individual and collective training plan (OICTP), outlining the initial system training concept and strategy and as much of the individual and collective unit and institutional training requirements as known.

(6) The capability of the player personnel, trained with the draft documentation and storyboard training materials, to perform the task selected for training to the required standards in the field phase of OT I will be made a critical test issue.

(7) The training support plan will be available for evaluation at OT I.

e. Personnel Support Plan. There are no personnel constraints related to mission area or force level. Introduction of this system will reduce the overall number of special purpose generators which will, in turn, decrease the annual maintenance man hours. This may result in some reduction of manpower requirements at the general support and depot support maintenance levels.

ANNEX A
MISSION PROFILE

1. MISSION PROFILE:

a. WEAPONS POSING THREAT TO SYSTEM:

	<u>BDE</u>	<u>DIV</u>	<u>CORPS</u>	<u>REAR</u>
Small Arms	X			
Arty	X	X		
TAC AIR	X	X	X	X
Missile/Rocket	X	X	X	X

b. MISSION: Provide military units with conditioned electric power in required amounts and characteristics.

c. WEATHER EXTREMES: Climate categories 1-6. If supported equipment must operate in categories 7 or 8, protective shelter or kits may be provided.

d. TASKS:

(1) The function of electric power conditioners is to convert power for any period ranging from short intermittent periods to periods up to 24 hours per day for extended periods. Because solid state technology will be used in the power conditioners, and they will be electrically connected to a power source, tasking elements are expected to be based on that required for the power source. In this example, tasking is that required for tactical generators.

(2) <u>TASKS ELEMENTS</u>	<u>TIME</u>	<u>% OF TIME</u>
(a) Set up generator	15 min	1%
(b) Start generator	15 min	1%
(c) Operate at demand levels	21.5 hrs	90%
Full load	5 hrs	21%
75% load	6 hrs	25%
50% load	5 hrs	21%
25% load	4.5 hrs	19%
on line-0 load	1 hr	4%
(d) Shut down generator	15 min	1%
(e) Service time	30 min	2%
(f) Prepare for movement	15 min	1%
(g) Move to new site	1 hr	4%
MISSION TIME	24 hrs	

2. MOBILITY: System can be transported on vehicle types presently organic to units with no unacceptable degradation of the present mobility of those units.

3. OPERATING SUMMARY:

Conditioning Power - 89.5%

Not Conditioning Power - 10.5%

POWER CONDITIONING EQUIPMENT QUESTIONNAIRE

1. Manufacturer's Name:

2. Description of Equipment:

[illegible]

3. Description of Technology Used (non-propriety)

[illegible]

3.b. What are the major components used?

[illegible]

5. Load and Input Limitations

[illegible]

Model Description	Ambient Limits		Outdoor Enclosure	Method of Cooling
	Temperature	Humidity Elevation		

6.b. Is equipment adaptable to field use by Army personnel in rough terrain?

6.c. What is the extent of vulnerability to external effects (e.g., electromagnetic and nuclear radiation)?

7.a. Operation and Maintainability

Model Designation	Efficiency %		No Load Losses (W)	Audible Noise (dBA @ ft)	Reliability (Mean-time between failures in hrs)	Operational Life at Rated Load (hrs)	Maintainability (hours)	
	Full Load	3/4 Load					Mean time to repair	Preventive maintenance down-time

7.b. To what extent are established-reliability parts utilized?

7.c. To what extent is modular replacement used in maintenance?

7.d. What are the exceptions to total use of solid state components (e.g., electromechanical relays)?

7.e. Describe utilization of self-diagnostics and built-in test equipment.

8.a. Controls and Protective Features

Model Description	Detachable Control Panel for Remote Operation	Paralleling Capability	PROTECTION METHODS			
			Input/Output Over/Under Voltage	Input Over/Under Frequency	Over-temperature	Output Overcurrents & Fault Currents

8.b. To what electrical safety standards (e.g. NEMA, UL) does the equipment conform?

8.c. What meters and indicators are normally available?

9. Production

Model Designation	ESTIMATED UNIT COST			Production Rate (units per month)
	Quantity 50 (\$ each)	Quantity 100 (\$ each)	Quantity 500 (\$ each)	

APPENDIX C

DEPARTMENT OF THE ARMY
US ARMY MOBILITY EQUIPMENT RESEARCH & DEVELOPMENT COMMAND
FORT BELVOIR, VIRGINIA 22060

January 18, 1983

DRDME-PEB

Gentlemen:

A survey of available commercial power conditioning equipment (e.g., inverters, converters or frequency changers) is being conducted to assess currently available technology in this field. The information will be used in planning an approved program to develop or adapt power conditioning equipment for U.S. Army field use. The survey is not limited to solid state equipment; all types of equipment, including rotating machinery (e.g., motor-generator sets) are to be considered.

You are invited to participate in this study by completing the enclosed questionnaire for each model of power conditioning equipment which you manufacture. Additional commercial literature would also be useful.

In order to meet our survey schedule, your response by 15 February 1983 will be appreciated.

The information is requested for planning purposes. The Government does not intend to award a contract on the basis of this request or otherwise pay for information solicited.

For additional information, please contact Dr. W. David Lee (703) 664-5724.

Sincerely,

Herb Rothschild
Contracting Officer

Enclosure

A -- INFORMATION FOR USE IN PLANNING A DEVELOPMENT PROGRAM FOR MILITARY
POWER CONDITIONING EQUIPMENT. Sources sought for manufacturers of power
conditioning equipment of both solid state and rotating design (e.g., inverters,
converters and frequency changers) to provide information via a questionnaire.
The questionnaire requests data on cost, performance and availability of power
conditioning equipment now on the market. Information will be used in planning
a program to develop or adapt power conditioning equipment for Army field use.
THE GOVERNMENT DOES NOT INTEND TO AWARD A CONTRACT ON THE BASIS OF THIS REQUEST
OR OTHERWISE PAY FOR THE INFORMATION SOLICITED. Interested firms are invited to
submit information or data no later than 10 January 1983. U.S. Army MERADCOM,
