FOREWORD

This report presents the status of the Coso Monitoring Program Conducted for the period October 1985 through September 1986 by the Naval Weapons Center (NWC), China Lake, CA. The investigation, funded under the NWC Coso Geothermal Development Program, is being conducted to provide baseline information on Hydrology and Surface Geothermal activity in the Coso Hot Springs area.

This report was reviewed for technical accuracy by Steven G. Bjornstad.

19 ABSTRACT (Continue on reverse if necessary and identify by block number)

(U) The Coso Monitoring Program is a continuing effort in support of the development of the Navy's Geothermal Resources within the Coso Known Geothermal Resource Area (KGRA). Data are presented on the monitoring of steam flow rates and temperatures, water levels in ponds and wells, water chemistry, temperature logs of shallow wells and rainfall in the Coso Hot Springs Resort Area. A weekly photographic essay of the mud pots and pools shows the variation of surface water levels throughout the year.

INTRODUCTION

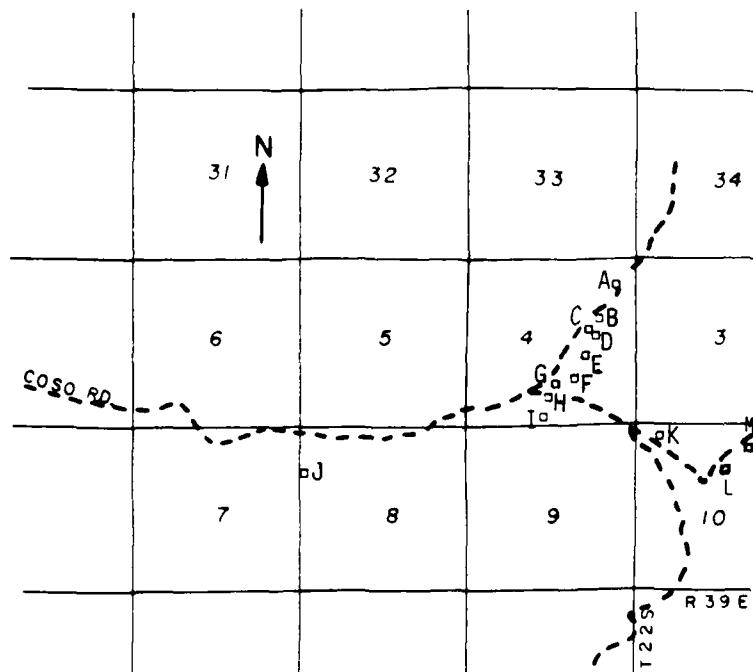

The Coso monitoring program was initiated in 1978 to gather baseline data on the surface and near surface geothermal activity at Devils Kitchen and Coso Hot Springs, the main thermal site within the Coso Known Geothermal Resource Area (Coso KGRA).

This report presents the results of continual baseline data collection for the Fiscal Year 1986. The collection of data, photographs, and data reduction was done by the author. Many others in the geothermal program office have helped on the monitoring program, especially Steve Bjornstad whose patient assistance in leading the author through the computer programs and data reduction methods made the whole effort possible.

Figure 1 is a map of the Coso Hot Springs area and shows the various monitoring sites referred to in this report. The letter that follows the site descriptions on the map indicates the monitoring functions: (1) continuous steam flow, (2) periodic steam flow, (3) continuous water level, (4) periodic water level (5) continuous temperature, (6) periodic temperature (7) photographic investigation of water level, and (8) water chemistry.

In this report the individual sites will be described only if new to the program or if there has been a significant change to the site. The major improvement this year was recording rain gauges that need to be changed twice a year rather than after each rain.

STEAM FLOW AND STEAM TEMPERATURE MONITORING

Steam flow and temperature are measured at several sites in the Coso Hot Springs area. Except for the monitoring station at the corrosion array within Devils Kitchen, all of the sites are located along the Airport Lake-Coso Hot Springs fault. The conversion factors for the data gathered at each site are as follows: Devils Kitchen, 40.23; Coso Corrosion Array, 82.99; Two-Inch Steam Well, 15.7; Eight-Inch Steam Well, 20.56; Schober's Resort, 0.5265.

DEVILS KITCHEN

Daily steam flows at Devils Kitchen for the reporting period are given in Appendix Table A-1. These data are shown graphically in Figure 2. Yearly mean data and standard deviations for the high and low daily steam flows at Devils Kitchen are given in Table 1.

The graph of Figure 2 shows an obvious change in the form of the record beginning in mid February 1986. It should be noted that prior years records show the beginning of this anomaly as occurring in November 1985. The reason for inception of this anomaly was repair and recalibration of the instrumentation. The instrumentation then performed consistently until mid February 1986 at which time the same style of instrumental response reoccurred. The reasons are still being sought, but the problem appears to be a subtle failure of the instrumentation with time.

Pounds Per Hour (pph)

Year	Mean, high daily flow	Standard deviation, high daily flow	Mean, low daily flow	Standard deviation, low daily flow
1985/6	353.9	17.8	312.3	16.6

COSO RESORT CORROSION ARRAY

Daily steam flows at the Coso Resort Corrosion Array for the reporting period are given in Appendix Table A-2. These data are shown graphically in Figure 3. Yearly mean data and standard deviations for the high and low daily steam flows at this site are given in Table 3.

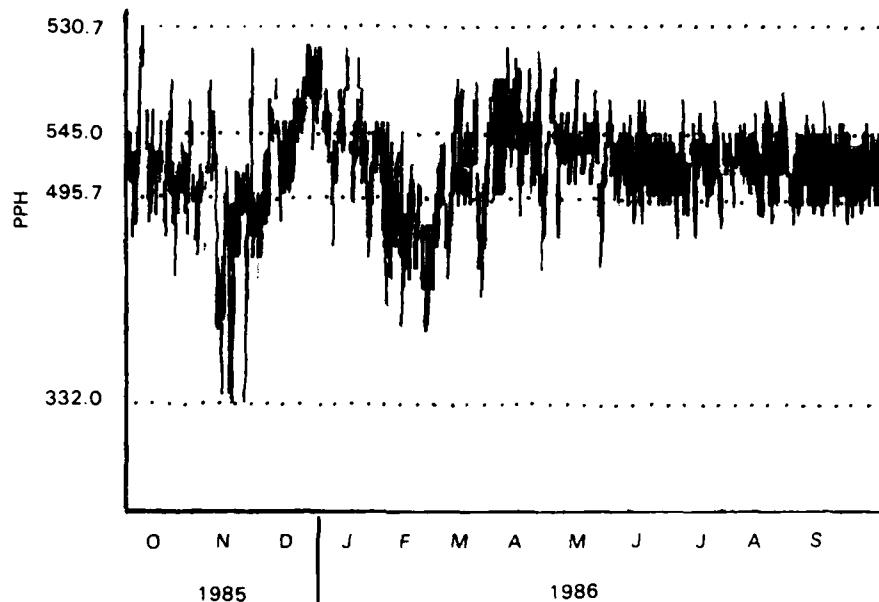

FIGURE 3. Coso Resort Corrosion Array

Pounds Per Hour (pph)

Year	Mean, high daily flow	Standard deviation, high daily flow	Mean, low daily flow	Standard deviation, low daily flow
1985/6	545.1	33.1	495.7	41.5

TWO-INCH STEAM WELL

Appendix Tables A-3 and B-1 give the daily steam flow and temperature data, respectively, for the Two-Inch Steam Well. These data are shown graphically in Figures 4 and 5. Yearly mean data and standard deviations are given for the high and low daily steam flows (Table 3), and for the high and low daily steam temperatures (Table 4).

TABLE 4. Two-Inch Steam Well Statistical Temperature Data, °F

Year	Mean, high daily flow	Standard deviation, high daily flow	Mean, low daily flow	Standard deviation, low daily flow
1985/6	193.3	8.5	176.5	10.2

EIGHT-INCH "STOVE-PIPE" WELL

Daily steam flows at the Eight-Inch Well are given in Appendix Table A-4 and are shown graphically in Figure 6. Yearly mean data and standard deviations for the high and low daily steam flows at the Eight-Inch Well are given in Table 5.

This site has always given erratic results. The data in this report is more stabilized than in the past. In the coming year, plans are to install a 90° elbow so that the orifice plate will be in a vertical position rather than the horizontal. It is felt this change will produce improved data.

The recorder was down for maintenance and calibration during September accounting for the absence of data.

Pounds per Hour (pph)

Year	Mean, high daily flow	Standard deviation, high daily flow	Mean, low daily flow	Standard deviation, low daily flow
1985/6	160.6	42.1	62.8	48.4

SCHOBER'S RESORT

Appendix Tables A-5, B-2, and B-3 give the daily steam flow, steam temperature, and ambient temperature data, respectively, for the Schober's Resort site. The steam flow and temperature data are shown graphically in Figures 7 and 8. Yearly mean data and standard deviations are given for the high and low daily steam flows (Table 6), and for the high and low daily steam temperatures (Table 7). Fluctuation and range in the daily ambient temperature in the Coso Hot Springs area is shown graphically as the ambient temperature at Schober's Resort in Figure 9.

The large fluctuations on the graphs (Figures 7 to 8) indicate time when the orifice in the orifice plate became plugged.

COSO MUD POTS

Appendix Tables B-4 and B-5 give the ambient and mud temperatures at the Coso Resort Mud Pot site. The temperatures are shown graphically in Figures 10 and 11. Yearly mean data and standard deviations are given for the high and low ambient temperature (Table 9) and the mud temperatures (Table 10). The recorder was down for repairs during October and November 1985.

COSO MUD POT PHOTOGRAPHIC INVESTIGATION

A weekly photographic investigation was initiated in January 1978 to document the fluctuation in fluid levels in several of the more prominent mud pots at Coso. This project will continue into the production and power-generation stages of the geothermal development.

Figures 12 through 23 illustrate the seasonal variations in the fluid levels of four of the Coso mud pots and pools. The largest pool is the south pool, which is located inside a circular excavation along the Airport Lake-Coso Hot Springs fault scarp, approximately 1000 feet south of the main resort area. The other three mud pots included in the photographic series are located in the fenced compound adjacent to and south of the main Coso Resort building. A complete weekly photographic series is maintained by the Geothermal Program Office, NWC.

WATER LEVEL MONITORING

Water levels have been monitored in the past, in three wells and three pools. In this report the number in each case has been reduced to two. The absent well is Coso Well 2 which during a pump replacement in August of 1985 the tube through which the measurement was taken was damaged to the point that measurement is impossible. The cistern at the mud pots, the third pool, was filled with sand during runoff of water during the rain of August 1984.

Figure 24 is a plot of water levels at Coso Well 1 and 4P-1. The dotted lines during March, June, July and September were times when the measuring device was down for repair.

TABLE 12. Summary of Water Level at South Pool,
True Elevation, Referenced USGS Benchmark 3635-1905-13B.
January 1980 through September 1986.

Year	High	Low	Mean	Standard deviation
1980	3615.55	3610.55	3613.05	1.8
1981	3614.95	3610.55	3612.65	1.4
1982	3615.05	3611.95	3613.75	1.0
1983	3616.65	3613.15	3614.75	1.1
1984	3614.54	3609.84	3612.69	1.1
1985	3614.46	3610.54	3612.89	1.5
1986	3615.52	3611.65	3613.80	1.3

The water level data presented in this table were collected by the U.S. Army Corps of Engineers, Las Vegas District, Nevada, using a VTPR-1000 pressure transducer connected to a VTPR-1000 data logger. The data were collected at the South Pool of the Lake Mead National Recreation Area, located in Clark County, Nevada, USA. The data represent the mean water level for each month, calculated from daily measurements taken at approximately 12-hour intervals.

RAINFALL AT COSO RESORT AREA AND ROSE VALLEY

Rainfall in the Coso Hot Springs basin is monitored at five sites as shown in Figure 25. Instrumentation at each site includes battery operated digital read out gauges triggered from a tipping bucket and manually read funnel gauges. The latter part of the year this instrumentation was replaced with new tipping buckets and 6 month duration battery operated strip recorders. This new equipment will give us continuous data not affected by evaporation with only two or three trips to gauges per year.

Data collected from these sites are listed in Table 13.

Data collected in Rose Valley are listed in Table 14.

WATER ANALYSIS OF COSO AREA WELLS

Water sampling of two Coso observation wells (Coso Well #2 and Observation Well #3) that are being monitored for chemical composition was conducted on July 30, 1986 and May 14, 1986.

Table 15 shows the chemical analysis for each well; these analyses were performed by BC Laboratories, Inc., Bakersfield, Calif.

TABLE 15. Water Analysis

Constituents	Coso Well #2 mg/liter	Observation Well #3 mg/liter

WATER ANALYSIS OF COSO DEVILS KITCHEN

Water sampling of two sources of water in Devils Kitchen was conducted on July 30, 1986. Table 17 shows the chemical analysis of water from the spring south of the steam array and condensate from the steam array; these analyses were performed by B.C. Laboratories, Inc., Bakersfield, Calif.

TABLE 17. Chemical Analysis

Constituents	Devils Kitchen Spring mg/liter	Devils Kitchen Array mg/liter

(-) refers to "less than".

PLANS FOR 1987

Change piping at the eight-inch well with a 90° elbow to position the orifice plate in a vertical plane. This change was made at Schober's Resort Steam Well resulting in more stabilized data.

Install pressure method of water level data retrieval at Coso #1 which will provide a continuous record rather than an intermittent weekly record.

Update the well temperature logging equipment with improved high temperature sensors.

These items along with a continuing Maintenance, Upkeep, Repair (MUR) program will enhance the data gathering capability.

SUMMARY

The ongoing monitoring program has continued successfully during this reporting period. Minor instrumental problems have been identified and their effects on the data noted.

The photographic essay and the water level measurements continue to record the same types of variations from year to year for the mud pots and pools. The long term continuity in this data continues to indicate that local evaporation and rainfall are the major controlling factors for the observable surface phenomena.

The testing of the steam wells in the Condy and Jim Moore breccia pipes within the Coso steam field and the injection of spent fluids into the spreading fracture network tapped by the 31-8 and adjacent well has shown no identifiable affects on the mud pots or pools within the National Register Site to this date.
