## FINAL REPORT

This final report covers the action taken regarding equipment purchases, under Contract AFOSR-87-0021. The funds, totalling \$197,286 were for the purpose of purchasing and establishing a network of Microwax computers for research in the area of chemical physics particularly involving dynamics and kinetics phenomena. We have purchased all the original stated items except the line printer and the IBM-PC terminals. These latter items were replaced with the purchase of the extra disk storage deemed important to attain maximal usage from the hardware. Attached is a list of all the items purchased from DEC, their model number and cost.

The overall system network is fully on-line and we are finding that the machines make a significant impact on our research. The design of the networked set of computers linked to the Departmental mainframe Vax is proving to be very effective. Additional experience will be needed to finally establish the optimal mode of system operation but we are already finding considerable speed-up in the rate that computations can be performed. The computers are being especially put to use for studying problems in gas-surface dynamics, molecular collisions and related problems in chemical kinetics. For example, in the case of gas-surface dynamics the system of computers have allowed us to perform extensive wavepacket calculations leading to a deeper understanding of the role of structure in gas-surface interactions. In the case of chemical kinetics we have been able<sup>3r</sup> to unravel complex mechanistic details through the use of computational sensitivity analysis. Listed below are several specific recent manuscripts resulting from the use of the Microvax computers.
