16. Abstract This report documents the approaches portion of the Fixed Wing Microwave Landing System (MLS) Terminal Instrument Procedures (TERPS) data collection and processing project using a Cessna 172 (C-172) aircraft. This is one part of the Fixed Wing MLS TERPS data collection and processing program being performed at the Federal Aviation Administration (FAA) Technical Center. The program was undertaken to collect flight test data in various aircraft to establish a data base for development of MLS TERPS criteria. Data were collected during both missed approaches and landings using glideslopes of 3°, 4°, and 5° with all flights being tracked by ground based tracking systems. Statistical processing was performed on both the airborne and tracker data, and various graphical plots were produced. The processed data were delivered to AVN-210 for inclusion in the MLS TERPS criteria development data base.

EXECUTIVE SUMMARY

This report documents the Federal Aviation Administration (FAA) Technical Center's Cessna 172 (C-172) Fixed Wing Microwave Landing System (MLS) Terminal Instrument Procedures (TERPS) approach data collection and processing project. This is one portion of the Technical Center's MLS TERPS data collection program. As the implementation of MLS approaches, the application of Instrument Landing System (ILS) TERPS criteria to MLS guided procedures has become inadequate due to MLS's more extensive guidance capabilities. The Technical Center's Engineering Division, ACT-100, was tasked by the Standards Development Branch, AVN-210, Aviation Standards National Field Office, through the Navigation And Landing Division, APM-400, with collecting and processing MLS TERPS flight test data in a Cessna-172 general aviation aircraft. AVN-210 will use the data collected during this project, and additional projects being conducted in various aircraft by the Technical Center and other organizations, to develop MLS TERPS criteria.

During this flight test series, various approach and departure procedures were flown in a leased C-172 to and from runway 13/31 at the Atlantic City International Airport (ACY). The departure procedures flown will be the subject of another report. A Bendix Basic Narrow MLS was used, along with a Bendix MLS receiver. Approach angles of 3°, 4°, and 5° were used for both missed approaches and landings. Sixteen general aviation subject pilots completed all or part of the flight test series. All flights had aircraft parameters recorded by an on-board data collection system, and were tracked throughout by ground based tracking systems.

The airborne and tracking data from each flight were checked for validity, merged, smoothed, and gaps in the data were filled by either linear interpolation or a least-squares quadratic polynomial curve fitting routine. The data were partitioned into bins and statistical calculations were performed. Plan, profile, composite, isoprobability, and scatter plots were drawn. The processed data were delivered to AVN-210 for inclusion in the MLS TERPS criteria development data base.

INTRODUCTION

BACKGROUND AND OBJECTIVES.

As the implementation of the Microwave Landing System (MLS) approaches, the application of Instrument Landing System (ILS) Terminal Instrument Procedures (TERPS) criteria to MLS guided approaches and departures has become inadequate due to MLS's more extensive guidance capabilities. The Federal Aviation Administration (FAA) Technical Center's Engineering Division, ACT-100, was tasked by the Standards Development Branch, AVN-210, Aviation Standards National Field Office, through the Navigation And Landing Division, APM-400, with collecting and processing MLS TERPS flight test data in a Cessna-172 (C-172) general aviation aircraft. AVN-210 will use the data collected during this project, and other projects being conducted in various aircraft by the Technical Center and other organizations, to develop an MLS TERPS criteria data base.

SYSTEM/EQUIPMENT DESCRIPTION

MLS AND PRECISION DISTANCE MEASURING EQUIPMENT.

The "Basic Narrow" MLS used for this project was developed for the FAA by the Communications Division of the Bendix Corporation. It consists of azimuth and elevation subsystems in a noncollocated configuration. It provides proportional guidance through $+40^\circ$ of azimuth and 0° to 15° in elevation in the Phase III signal format. An International Civilian Aviation Organization (ICAO) signal format MLS could not be procured in time for this phase of the project. Because a Precision Distance Measuring Equipment (DME/P) ground station was not available for this flight test series, the airport Conventional Distance Measuring Equipment (DME/N) ground station was used instead. This did not present a problem procedurally because the airport DME ground station is located next to runway 13/31, approximately 1 mile from the azimuth DME location.

TEST AIRCRAFT.

The test aircraft was a leased Cessna-172P. This is a representative small general aviation (GA) aircraft, with a gross weight of approximately 2,400 pounds, a cruising speed of 110 knots, and approach speeds in the range of 70 to 90 knots. The aircraft's avionics were standard, except for the addition of a Bendix MLS Service Test Evaluation Program (STEP) receiver and control head.

AIRBORNE DATA COLLECTION EQUIPMENT.

The airborne data collection system (figure 1) was designed and fabricated by ACT-140. It was controlled by a Motorola 6809 microprocessor and an ACT-140 designed Aircraft Systems Coupler (ASC) retrieved analog and digital aircraft sensor data, along with time code generator data, and formatted it in 8-bit parallel form for processing by the computer. The data were recorded on a digital cassette tape recorder twice per second. A Collins DME-40 interrogator was used to provide DME information to the data collection system (the GA DME

FIGURE 1. AIRBORNE DATA COLLECTION SYSTEM.

interrogator installed in the instrument panel was not equipped with recordable outputs). The parameters collected are listed in table I.

TABLE I. AIRBORNE DATA COLLECTION PARAMETERS

<u>Parameter</u>	<u>Units</u>	<u>Resolution</u>
Time	Hours, minutes, seconds, 1/10 second	0.1 sec
Vertical deviation (flight technical error (FTE))	Crosspointer deviation in millivolts (mV)	0.5 mV
Lateral deviation (FTE)	Crosspointer deviation (mV)	0.5 mV
MLS azimuth	Degrees	0.005°
MLS elevation	Degrees	0.005°
DME	Nautical miles (nmi)	0.01 nmi

AIRCRAFT TRACKING EQUIPMENT.

In order to assure continuous tracking of the aircraft during all maneuvers, two different tracking systems were used: NIKE radar and a laser tracker.

The Technical Center's NIKE radar is a precision X-band instrumentation radar system that was adapted from a missile tracking radar to measure and record an aircraft's position in slant range and azimuth and elevation angles. NIKE has a maximum range of 200 nmi.

The pulsed infrared laser tracker is positioned approximately 0.5 mile north of runway 13/31. A mirrored retroreflector was mounted below the cockpit of the aircraft to return the laser beam. Slant range and azimuth and elevation angles were recorded as for NIKE. The laser tracker generally provided the more accurate tracking data at distances of 5 nmi or less from the ground point of intercept (GPI), and at these distances is preferred to NIKE data. Parallax corrections for MLS antenna and retroreflector locations were not made because of their relatively close proximity.

TEST LOCATION.

All procedure development and data collection flights were flown to and from runway 13/31 at the Atlantic City International Airport (ACY), which is located on the grounds of the FAA Technical Center, Egg Harbor Township, New Jersey.

PROCEDURE DEVELOPMENT AND EVALUATION

The procedures for this flight test series were developed by Mr. Theos McKinney, ACT-630, FAA Technical Center, and personnel from the Standards Development Branch, AVN-210, located at the FAA Aeronautical Center, Oklahoma

City, OK. AVN-210 personnel were at the Technical Center during the procedure evaluation flights. The procedure evaluation flights were flown by Technical Center pilots to and from runway 13/31. Approach angles up to 6° were flown before the final determinations were made. After considering a number of factors including safety and approaches during tailwinds, it was determined that the maximum operational elevation angle (MOEA) would be 5°. Since the shallowest approach angle would be 3°, it was obvious that the midpoint elevation angle should be 4°. At the same time, two departure procedures were evaluated. They will be discussed in the C-172 "Departures Data Report."

OPERATIONAL PROCEDURES

SUBJECT PILOT SELECTION.

The subject pilots for this flight test program were taken from the ranks of general aviation pilots. In all, 16 subject pilots were used. All pilots were instrument rated, and had no previous experience flying MLS procedures.

SUBJECT PILOT BRIEFING.

When a subject pilot arrived at the Technical Center, he received a thorough briefing by one of the project safety pilots. Included in the briefing was an explanation of the operation of MLS, a review of aircraft operating procedures, and a review of the procedures to be flown. A sample of the information packet sent to each subject is in appendix A.

DATA COLLECTION FLIGHTS.

In addition to the subject and safety pilots, each flight had a data collection technician onboard. The data collection technician operated the data collection system, monitored all project equipment, and recorded event mark times and other observations on a flight log (see appendix B). The project safety pilot handled all communication with air traffic control (ATC) and the tracking facilities, monitored the subject pilot for safe operation of the aircraft, and operated the vision restricting goggles.

Instead of conventional vision restricting goggles or a hood, an electronically controlled set of instrument meteorological condition (IMC) simulation goggles were used. These goggles have the ability of simulating runway visual range (RVR) of 0 to 1 mile. They can also be instantly cleared to simulate breaking out of clouds. The goggles have a sensing switch that allows a portion of the goggles to be clear while the subject pilot is looking at the instruments, but causes the goggles to completely fog over if the subject lifts his head to look out of the cockpit. Since the goggles were operated by the safety pilot, the chances of cheating were reduced, and a more natural flight environment was presented. Therefore, the subject pilot was able to concentrate on flying the aircraft and not have to worry about removing a hood at decision height (DH). During an approach, the visibility was set to zero. When the subject pilot reached DH, the safety pilot simply cleared the glasses for a landing or kept them fogged for a missed approach. This was important, since the subject pilot did not know if the procedure would terminate in a landing or a missed approach until reaching DH.

Each subject pilot flew 16 approaches. Twelve resulted in missed approaches, and four were flown to landing. In addition, four departures were flown and will be discussed in the C-172 Departures Data Report. The sequence of runs is listed in table 2.

9. 3° Missed approach	19. 5° Missed approach
10. 5° Landing	20. 3° Landing

DATA PROCESSING

FLIGHT TEST DATA.

Flight Test data came from four sources: an airborne data tape, a NIKE tracking tape, a laser tracking tape, and observer flight logs. The airborne tape contained the aircraft parameters collected onboard the aircraft during the data collection flights (table 1). The NIKE and laser tracking tapes contained tracking data that had been converted from slant range, azimuth, and elevation to x, y, and z coordinates using the Technical Center coordinate system. During processing the origin of the tracking data was translated to the appropriate GPI for each glide slope angle. The observer flight logs contained the times for specific events during the procedures and any other pertinent information about the flight.

SUBJECT PILOT QUESTIONNAIRE.

At the conclusion of the fourth flight session, the subject pilot was given a questionnaire to fill out (see appendix C). These questionnaires asked the pilot his opinions on the flyability of each procedure. The completed questionnaires were forwarded to AVN-210 for tabulation and analysis.

PLAN AND PROFILE VALIDITY PLOTS.

For each approach, plan and profile view validity plots were generated (see appendix D). These plots depict vertical and lateral aircraft position and the corresponding azimuth and elevation crosspointer deviations, with respect to

the intended path. The plots determined which runs contained valid data. Runs that had had tracking data were incorrectly flown due to ATC instructions, or were invalid for other reasons, were eliminated from the statistics pool. The total number of runs flown and the number that were usable are shown in table 3.

TABLE 3. LIST OF USABLE RUNS

Total Number of Pilots:	16
Total Number of Approaches:	258
Number of Missed Approaches and Landings Providing Usable Data:	201
Number of Missed Approaches Providing Usable Data:	
3° Missed Approaches:	49
4° Missed Approaches:	51
5° Missed Approaches:	52
Total	152
Number of Landings Providing Usable Data:	
3° Landings:	23
4° Landings:	13
5° Landings:	13
Total	49

MERGE.

In order to process data that came from three different sources, it was necessary to merge the data from the airborne, NIKE, and laser tapes into one file. When recorded, each record on each tape had been tagged with synchronized time. Thus, it was possible to merge the data from the three different tapes into one data file. The time on the airborne tape was considered the "master," and the data from the tracking tapes were aligned with the data from the airborne tape. A mode flag was created for each merged data file to indicate which tracking data sets were valid. Tracking data were considered invalid only if there were no data with the proper time tag.

FILL.

Occasionally, gaps were present in both the airborne and tracking data. To provide as continuous a string of data as possible, two methods were used to fill in these gaps. If the gap consisted of only one missing record, linear interpolation was used to calculate the missing data. If the gap was between 2 and 20 records long, a least-squares quadratic polynomial curve fitting routine was used. If the gap was greater than 20 records, the gap was too long for the filling routines and was left in the data base.

SMOOTHING.

During processing of the data, a problem was discovered in some of the isoproductivity plots, particularly the navigation system error plots. The

plots were extremely noisy, having cyclical spikes with peak to peak values of 30 feet or more. After extensive investigation, the problem was traced to the conversion of MLS azimuth, elevation, and DME to the x,y,z coordinates needed for certain statistical processing. The algorithms used during coordinate conversion were designed to use DME/P data with a resolution of 0.01 nmi. However, only DME/N data, which has a resolution of 0.1 nmi, were available during the flight tests, so smoothing of the DME/N data was necessary. The DME/N data were put through a 41-point smoothing filter, and the resulting data were truncated to 0.01 nmi. This smoothed data was used for all statistical processing where DME/P data were needed, and produced results similar to those seen in previous tests using DME/P data.

DATA PARTITIONING.

In order to compute the required statistics, it was necessary to partition, or bin, the data horizontally (perpendicular to the intended flightpath), and vertically (parallel to the ground). For horizontal bins, the first bin (bin zero) is located along the system x-axis (runway centerline) at the point where a line dropped from the theoretical threshold crossing height (TCH), which is 50 feet above ground level (AGL), intersects the x-axis. Each subsequent bin was located at 50-meter intervals, with positive bins located on the approach side of bin zero and negative bins located on the landing, or missed approach side of bin zero. Additional bins were located at the following points:

1. Intermediate Approach Fix
2. Final Approach Fix
3. Missed Approach Point (DH)
4. Missed Approach Boundary

Vertical partitions were established for missed approach segments. The vertical bins were located at 10-meter intervals AGL while below DH (200 feet), and at 25-meter intervals AGL above DH to 2000 feet AGL.

STATISTICS.

Statistical calculations were performed on the data in each bin. The parameters calculated are in table 4.

TABLE 4. STANDARD STATISTICS

<u>Parameter</u>	<u>Notation</u>
Number of data points	N
Arithmetic mean	$\bar{X}$
Maximum value	X_{max}
Minimum value	X_{min}
Unbiased estimate of variance	S_u^2
Biased estimate of variance	S_b^2
Unbiased estimate of standard deviation	S_u
Biased estimate of standard deviation	S_b
Skewness	b_1
Kurtosis	b_2

To aid in the calculations for skewness and kurtosis, the first 4 moments about zero were calculated. The equations used to calculate the standard statistics and first 4 moments about zero are shown in table 5.

RESULTS

STATISTICAL PRINTOUTS AND TAPES.

The statistical data were delivered to AVN-210 in two different formats. A set of summary statistics and the minima analysis were printed to allow a quick overview of the statistical data. The full set of statistical data were recorded on magnetic tapes due to the extensive volume of paper that would be needed to print the complete set. Examples of the summary statistics printouts are provided in appendix E. The complete set of minima analysis printouts are presented in appendix F. The parameters for which statistics were calculated are listed by segment in tables 6, 7, and 8. The parameters for the minima analysis are listed in table 9.

COMPOSITE PLOTS.

To see how the subject pilots performed as a group, composite plots of each type of approach were produced and are shown in appendix G. These plots are an overlay of each of the individual plan and profile view validity plots and provide an indication of how much airspace needs to be protected for a particular procedure.

ISOPROBABILITY PLOTS.

A graphical presentation of the computed statistics was performed by the drawing of ± 6 standard deviation isoprobability plots. The complete set of isoprobability plots is included in appendix H.

LANDING SEGMENT SCATTER PLOTS.

Due to the relatively small number of landings performed during this flight test series, no statistical analysis was done on the landing segment data. However, landing segment scatter plots with a 45 percent error ellipse on each plot were generated for both horizontal and vertical plans. Samples of the landing segment scatter plots are shown in appendix I.

DELIVERIES.

The following plots and processed data were shipped to AVN-210 on June 30, 1987:

1. All validity plots for missed approaches and landings.
2. All isoprobability plots for missed approaches and landings.
3. All composite plots for missed approaches and landings.
4. All summary statistics printouts for missed approaches and landings.
5. All minima analysis printouts for missed approaches.
6. Complete standard statistics on magnetic tapes for missed approaches and landings.
7. All landing segment scatter plots with 45 percent error ellipses.
8. All archival merge and statistics magnetic tapes.

TABLE 5. STANDARD STATISTICS EQUATIONS

Arithmetic Mean (first moment about zero): $\bar{X} = M_1 = \frac{\sum X}{N}$

Second Moment About Zero: $M_2 = \frac{\sum X^2}{N}$

Third Moment About Zero: $M_3 = \frac{\sum X^3}{N}$

Fourth Moment About Zero: $M_4 = \frac{\sum X^4}{N}$

Biased Estimate of Variance: $S_b^2 = M_2 - M_1^2$

Unbiased Estimate of Variance: $S_u^2 = \frac{(S_b^2)N}{N-1}$

Biased Estimate of Standard Deviation: $S_b = \sqrt{M_2 - M_1^2}$

Unbiased Estimate of Standard Deviation: $S_u = \sqrt{\frac{(S_b^2) N}{N-1}}$

Skewness: $b_1 = \frac{M_3 - 3M_1M_2 + 2M_1^3}{(M_2 - M_1^2)^{1.5}}$

Kurtosis: $b_2 = \frac{M_4 - 4M_1M_3 + 6M_1^2M_2 - 3M_1^4}{(M_2 - M_1^2)^2}$

Project: MLS Steep Angle Approaches for TERPS, T0603P

Sponsor: FAA Navigation and Landing Branch, APM-410

Monitor: FAA Standards Development Branch, Aviation Standards National Field Office, AVN-210

Objective:

To provide flight data suitable for procedures specialists to develop criteria for MLS guided approaches and departures for general aviation aircraft. This data will be used to update Terminal Instrument Procedures (TERPS) for fixed wing aircraft.

Operational Areas Include

1. MLS Precision Approaches
2. Normal and Steep (3°, 4°, 5°) Approach Gradients
3. Height Loss at Missed Approach Point
4. MLS Azimuth Departures

Technical Issues

1. Pilot Workload
2. Aircraft Performance Limitations

Location

Federal Aviation Administration Technical Center
Atlantic City Airport, NJ 08405

Project Contracts

1. Edward Pugacz, Project Manager
MLS Fixed Wing TERPS Flight Tests, ACT-140
(609) 434-5707, FTS 482-5707
2. Ken Johnson, Subject Pilot Scheduling
(609) 434-6467, FTS 432-6467

Attachment #1

VOLUNTARY FAA EMPLOYEE

In order to cover our legal obligation to you during your participation in this project, a request for personnel action will be filled out for you using the information you supply on the subject pilot personal information questionnaire. This will make you a WITHOUT COMPENSATION VOLUNTEER EMPLOYEE with the Guidance and Airborne Systems Branch, ACT-140, FAA Technical Center, Atlantic City Airport, NJ, without compensation during the term of your involvement in this project, approximately 3 days.

Employee Status

A WITHOUT COMPENSATION VOLUNTEER EMPLOYEE is NOT a Federal Employee for any purposes other than injury compensation or laws related to the Tort claims Act. Service is NOT creditable for leave accrual or any other employee benefits. However, travel orders will be issued to you, and thereby provide a method to reimburse you for travel expenses as described in attachment #2.

Volunteer Employee Duties

During your involvement in this project, you will perform the duties of pilot of a Cessna-172 aircraft, including preflight planning, aircraft control, navigation, and communication. You will be assigned to perform the technical inflight evaluation of various guidance and airborne systems. You will normally be assigned to work between the hours of 8:00 a.m. and 4:30 p.m. You will be the pilot of the aircraft, however, the project safety pilot will be pilot-in-command AT ALL TIMES.

Qualifications

You will be required to meet the following minimum qualifications to participate in this project:

1. Hold a valid FAA Pilot Certificate with an Instrument Rating.
2. Hold a valid FAA Medical Certificate.
3. Meet the recent flight experience requirements of FAR 61.57.

Termination

Upon the completion of the assignment, your voluntary employment will be terminated, with no further obligation to either party.

ATTACHMENT #2

TRAVEL EXPENSES

You will be reimbursed for normal travel expenses incurred while participating in this project. A U.S. Government travel voucher, Standard Form 1012, has been provided for you to record expenses and submit upon the completion of your participation in the program. The following is a list of important information to keep in mind while on government reimbursed travel.

1. Mileage for actual miles driven in your own car is reimbursed at 20.5¢ per mile.
2. Air travel (if necessary) should be via coach class, and at a discount or excursion fare, if available.
3. By Federal Law, the MAXIMUM ALLOWABLE AMOUNT you can be reimbursed for lodging and meals during any one day is \$126.00. Of that amount, \$33.00 is a flat reimbursement for meals and incidental expenses, except for the first day of travel, which is limited to \$16.50. The remainder, \$93.00, is a maximum amount reimbursable for lodging. All other reasonable expenses (car rental, airline tickets, tolls, etc.) are reimbursed at full rate.
4. All receipts for airline tickets, lodging, taxis, and tolls must be remitted with your travel voucher. Receipts for meals are not required.
5. Upon completion of the form, mail to the following address in the postage paid envelope provided for your convenience.

Edward Pugacz
FAA Technical Center
ACT-140
Atlantic City Airport, NJ 08405

DIRECTIONS TO ATLANTIS HOTEL/CASINO

Take the Atlantic City Expressway to the end. Turn right onto Atlantic Avenue.

Proceed several blocks south to Florida Avenue. Turn left.

Proceed to the end of the street. (telephone (609) 441-2888).

DIRECTIONS TO THE PIER 4 HOTEL

Take the Atlantic City Expressway to the Garden State Parkway south. Get off on exit 30.

When you leave the toll booth proceed straight ahead on highway 52 towards Ocean City. Cross route 9 and proceed to the traffic circle.

Bear right at the circle and exit right onto the first road (before passing the Circle Liquor Store).

The Pier 4 is ahead and to your left behind the Crab Trap restaurant. (telephone (609) 927-9141).

DIRECTIONS TO THE COMFORT INN AND DAYS INN

Take the Atlantic City Expressway to the Garden State Parkway south. Bear right on the parkway 1/4 mile to exit 37.

From exit 37 turn left onto Washington Avenue. Proceed to the traffic light and turn right. This is Fire Road.

For Comfort Inn: Proceed on Fire Road to the first traffic light and turn left onto route 40 east. Continue on route 40, approximately 1/2 mile. The Comfort Inn will be on your right (telephone 609-646-8880).

For the Days Inn: Proceed on Fire Road past the first traffic light (route 40) until just short of the second traffic light. The entrance to the Days Inn will be on the right, just before the Mobil station (telephone 609-641-4500).

DIRECTIONS TO THE TECHNICAL CENTER FROM THE
GARDEN STATE PARKWAY AND ATLANTIC CITY EXPRESSWAY

If travelling on the Garden State parkway, use exit 38 west/to Philadelphia.

Take the Atlantic City Expressway to exit 9. This exit has a mechanical toll taker that takes exact change only (25 cents).

If travelling from Atlantic City, turn right, if travelling from Philadelphia, turn left, and proceed over the bridge to the traffic circle.

Exit the circle on the third road. This is a divided highway with an Atlantic City Airport/FAA Technical Center sign.

The main gate is straight ahead.

At the main gate indicate you have an appointment with John Ryan, ACT-630, Flight Operations Building (Hangar). Parking is across the road from the hangar.

Once at the hangar, proceed across the hangar floor to the elevator. We are on the second floor, room 207.

DIRECTIONS TO THE TECHNICAL CENTER FROM PIER 4 HOTEL

Go around circle and proceed on highway 52 west to the Garden State Parkway. Take the parkway north to exit 38 (Atlantic City Expressway).

Follow Parkway/Expressway directions above.

DIRECTIONS TO THE TECHNICAL CENTER FROM THE COMFORT INN AND DAYS INN

From Comfort Inn: Turn left onto route 40 west. Proceed to the second traffic light (at the Sears Shopping Center).

Continue to the traffic circle, and exit on the second road (between the Sunoco and Mobil stations). This is Tilton Road.

Proceed on Tilton Road and over the bridge to the traffic circle.

Exit on the second road (divided 4 lane highway) and proceed straight ahead to the main gate. Follow the last two Parkway/Expressway directions above.

From the Days Inn: Turn right onto Tilton Road (highway 563), and proceed to the traffic light (at the Sears Shopping Center). This is the second traffic light from the Comfort Inn. From this point, follow directions from the Comfort Inn.

SUBJECT PILOT QUESTIONNAIRE

Pilot Questionnaire

Steep Angle Approach

Date _____
Pilot _____

EL Angle _____
Wind D/V _____

All questions relate to IMC MLS operational performance.

1. Was the EL angle:

Too shallow About Right Too steep
1 2 3 4 5 6 7

2. Could the EL angle be steeper? ☐ yes ☐ no

3. Indicate the difficulty experienced in intercepting and maintaining the glide path angle.

Very easy About Right Very difficult
1 2 3 4 5 6 7

4. Indicate the difficulty experienced in keeping the AZ needle centered in relation to the EL angle being used.

Very easy About Right Very difficult
1 2 3 4 5 6 7

5. Indicate your assessment of the stabilized power setting relative to operational procedures.

Too low About Right Too High
1 2 3 4 5 6 7

6. Compare the difficulty of visual transition and landing from a _____ angle to a normal 3 degree ILS:

Much less Same Much More
1 2 3 4 5 6 7

7. Compare the workload of a _____ GS to a normal 3 degree ILS.

Much Less Same Much More
1 2 3 4 5 6 7

8. Was the GS intercept distance from DH

Too Short About Right Too Long
1 2 3 4 5 6 7

9. What is your recommendation for the maximum allowable rate of descent:

_____ fpm.

10. What is your recommendation for a minimum at DH?

☐ 100 ☐ 150 ☐ 200 ☐ 250 ☐ 300 ☐ Other

11. Was this DH satisfactory for the execution of a missed approach? _____

PILOT QUESTIONNAIRE

MLS DEPARTURE

Date _____

Wind D/V _____

Pilot _____

1. What degree of difficulty did you have maintaining the specified AZ course?

Easy			None		Very Difficult
1	2	3	4	5	6 7

2. Was the difficulty based on

☐ Workload?

☐ Sensitivity of the AZ course?

☐ Other? What nature _____

3. Comments: _____

PILOT QUESTIONNAIRE
MLS SHUTTLE PATTERNS

Date _____

Wind D/V _____

Pilot _____

1. Were the PDME fix distances?

Too close together	•	About right	Too far apart
1 2 3 4 5 6 7			

2. Was the distance between the two AZ courses sufficient to execute the turns?

Too close	About right	Too far apart
1 2 3 4 5 6 7		

3. Was the workload?

Very low	About right	Too much
1 2 3 4 5 6 7		

4. How would you compare the shuttle pattern to a conventional holding pattern?

Much easier	Same	Much more difficult
1 2 3 4 5 6 7		

5. Comments: _____
- _____

PILOT QUESTIONNAIRE

MLS COURSE REVERSALS

Date _____

Wind D/V _____

Pilot _____

1. Were the AZ courses used for containment?

Too close			About right		Too far apart	
1	2	3	4	5	6	7

2. Were the PDME fixes used?

Too close			About right		Too far apart	
1	2	3	4	5	6	7

3. Was it helpful to provide the maximum PDME distances for containment?

☐ Yes

☐ No

4. Was the specified heading sufficient to intercept the AZ course defined for the course reversal?

☐ Yes

☐ No

5. Was the approach course capture from the turn reversal acceptable?

☐ Yes

☐ No

6. How did the test turn reversals compare to a "conventional" procedure turn?

Easier			Same		More difficult	
1	2	3	4	5	6	7

7. Comment: _____
