<p>This report documents a parametric cost model for aircraft avionics installations and modifications. Cost and technical data collected during a previous avionics installation cost study, as well as data collected from data sources identified during this effort were used to analyze costs of individual avionics black-box modifications or installations into aircraft. The report details the methodology used to construct the data base and to develop cost-estimating relationships (CERs). Details of CERs developed for non-recurring costs, recurring installation/modification kit costs, labor costs, and manhours are provided, as well as the supporting data used in the analyses. The report is only available to authorized U.S. Government personnel.</p>

## PREFACE

Management Consulting & Research, Inc. (MCR) is providing support to the Naval Center for Cost Analysis (NCA) to develop an Avionics and Missile System Installation Cost Data Base and Parametric Cost Model. This project is being performed under contract N00600-84-D-4171 Delivery Order 0012 of 13 April 1987. This work is in essence an extension of analysis performed previously for NCA, under contract N0014-85-C-0802 of 1 September 1985, "A Parametric Aircraft Avionics and Missile System Installation Cost Model."

The Contract Data Requirements List (CDRL) calls for a technical report that documents the statistical model and results of analyses. This technical report, and separately bound data base, fulfill this requirement.

MCR is grateful to several people who assisted in obtaining and accessing the data required for both the current and previous efforts. The time and effort spent to help in the data collection effort was well appreciated. We would particularly like to thank the following people for their assistance during this most recent effort:

- Mr. Jack Moore (and others) of the Naval Air Systems Command (NAVAIR 102) who provided assistance in obtaining CCB documents and explaining the modification funding process, and
- Mr. Dan Alton, Mr. Dalton Wood, and Ms. Donna Hall of the Naval Air Maintenance Organization (NAMO), Patuxent River, for their help in accessing TDSA data and explaining the modification tracking process.

## I. INTRODUCTION

This introduction is intended to orient the reader concerning the:

- background,
- purpose/scope of the study, and
- organization of the report.

### A. BACKGROUND

The Naval Center for Cost Analysis (NCA) is responsible to the Secretary of the Navy and to the Chief of Naval Operations for providing independent parametric cost estimates of acquisition programs as part of the Department of Defense Cost Analysis Program. NCA is also responsible for validating cost estimates within the Department of the Navy, as directed.

In order to effectively perform its assigned mission, NCA requires analytical techniques which are both responsive to short lead-time tasking as well as sufficiently accurate to serve as a basis for comparison with the detailed cost estimates produced by the Program Managers of major defense systems. The first requirement dictates a model which is both easy to use and which requires relatively few input parameters. The second requirement dictates a model which is sensitive to more detailed system specifications and which includes sufficient documentation to be used with confidence when presenting independent cost estimates to Navy and OSD decision-makers.

The combination of these NCA requirements and the rapid pace of technological innovation in the field of avionics requires a

set of innovative and flexible tools to relieve the cost analyst of the time-consuming tasks of locating appropriate data and developing a methodology for each estimate as it is needed.

B. PURPOSE/SCOPE OF PROJECT

The purpose of this project is to expand on an aircraft avionics and missile system installation cost model previously developed for NCA. During the previous effort, cost and technical data on avionics and missile system installations were collected from several sources, and at several levels of detail. The data was adjusted and formatted into a consistent, well-documented data base. Cost estimating relationships were developed and documented for each main category of the installation Work Breakdown Structure (WBS). Results of the previous effort are detailed in A Parametric Aircraft Avionics and Missile System Installation Cost Model - Data Base Report, Volume I, TR-8516-1, Management Consulting & Research, Inc., 20 June 1986 and A Parametric Aircraft Avionics and Missile System Installation Cost Model - Final Report, TR-8516-2, Management Consulting & Research, Inc., 31 August 1986.

The previous effort involved developing cost models for avionics and missile system installations into aircraft at the OSIP (Operational Safety Improvement Program) level. The OSIP update programs often involved the installation, removal, or modification of several black-boxes within the aircraft. Each separate update action within an OSIP usually corresponds to a Technical Directive (TD). Therefore, there are often several TDs associated with an OSIP.

The current study was intended to utilize to a fuller extent all of the cost, program, and technical data previously collected, in an effort to break down the costs to the level of the separate black-box installation, removal or modification. During the previous effort analysis was concentrated on costs at the total update program level. The aim of this effort was to examine different aspects and in more detail some of the data that was collected previously, thus gaining further insight into the actual cost drivers of installation costs.

C. ORGANIZATION OF THE REPORT

This final report consists of two (2) volumes. Volume 1 contains the results of analysis and appendices. Volume 2 contains the raw and normalized TDSA data used in the data base.

Final report Volume 1 contains four sections. Section I provides the background, purpose/scope of the study, organization of the report. Section II includes a discussion of the data collection procedures, data sources, and data normalization techniques. Section III pertains to the methodology used to develop the CERs, including hypothesis of relationships, regression analysis, validation of CERs, and documentation of CERs. Section IV documents the aircraft avionics and missile system installation cost model and results of analyses.

Appendix A provides complete documentation of all CERS. Appendix B contains the full data base used to derive the CERS

and relevant CCB descriptions. Appendix C provides definitions of aircraft wiring classifications. Appendix D provides a full listing of the manhour data that was utilized in the installation learning curve analysis. Appendix E provides a description of the Navy aircraft modification funding and implementation cycle, as a reference for those unfamiliar with the modification process.

Although this report is intended to be a stand-alone document, the reader may wish to refer to the reports from the previous effort (cited in Section B above) for clarification or detail in certain areas.

D. CONTENTS OF THIS VOLUME

This volume contains appendices F and G, the raw data extracted from Technical Directive Status Accounting System (TDSA), and the TDSA installation manhour normalizations to unit 100, respectively.

The TDSA is an automated accounting system designed to store, maintain, and disseminate information concerning the status of TDs. The system provides the incorporation/non-incorporation status of the TDs as they apply to each equipment item (airframe, engine, support equipment, avionics, etc.) It also provides projected and actual man-hour reporting, configuration status of equipment items, change-kits material accounting, and summary reporting for overall management and budgeting. On-line access is provided to each Naval Aviation Rework Facility (NARF) and to the Naval Air Maintenance Organization (NAMO)

management. Detailed reports are distributed quarterly at the organizational level.

Further documentation of the data and reports available from the TDSA can be found in TDSA User Report Guide and NALDA User Manual/Data Dictionary, available at NAMO, Patuxent River, Maryland.

Appendix F contains the data extracted from the TDSA system. The data was obtained from queries to the TDSA at NAMO, Patuxent River. Queries were made for each OSIP for kit costs and then for manhours. The data from both queries was combined in Lotus 1-2-3 files. The combined files are shown in Appendix F, listed by OSIP number within OSIP year. The data is ordered as follows:

- OSIP#: The first two digits represent the OSIP year, the last three digits represent the OSIP number.
- TD#: The code describing the Technical Directive, as provided in TDSA. There are a total of sixteen positions in the alphanumeric field that describes the Technical Directive. The first three letters (positions 1-3) designate the type of aircraft affected by the change. The next two digits (positions 4-5) denote the type of change (50 = airframe change, 54 = avionics change, etc.) The next four digits (positions 6-9) provide the basic TD number. The next character (position 10) identifies an interim change by an "I". The next character (position 11) notes if the order is a revision to a previously issued order. The next number (position 12) provides the amendment number, if applicable. The next two digits (positions 13-14) identify the part number, if the kit was issued in parts. The next letter (position 15) denotes the type of kit (A = basic, B = spares, C = tools, D = special provisions, E/K = trainer, P = GFE supplies.) The last number (position 16) denotes the kit configuration number. If no kit is involved in the directive (e.g., for an administrative change), the last two

NOL 363 1153

digits are zeros. Complete definitions for all the code components can be obtained from the Naval Air Maintenance Organization, Patuxent River Naval Air Station.

- A/C: The category of aircraft affected by the change, where identified. The category codes are defined in Exhibit I-1.
- IX: Index number of the change that denotes change status. A = Authorized/Unpublished, B = Active/Published, C = Cancelled, D = Rescinded.
- Title: Title of the TD.
- MT. LVL: Maintenance level of the change. 1 = Organizational, 2 = Intermediate, 3 = Depot, 4 = NAVAIREWORKFAC Mod Team, 5 = Contractor, 6 = Contractor Mod Team.
- KIT\$: Estimated kit cost, in then-year dollars.
- QTY: Quantity of modifications reported as performed.
- TOTHRS: Total number of labor hours reported to perform reported modifications.
- UNHRS: Average labor hours per installation as provided in TDSA (truncated to the whole hour).
- EST MHR: Estimated manhours to perform the modification.

Appendix G contains the TDSA Installation Manhour Normalizations to Unit 100. The data was normalized using the learning curves as discussed in Volume 1, Section II, Data Collection/Sources/Normalization. Calculations were made only when all the necessary information was available. The data is listed by OSIP number within OSIP year, and contains the following:

- OSIP#: The first two digits represent the OSIP year, the last three digits represent the OSIP number.

**Exhibit I-1. TDSA AIRCRAFT CATEGORY  
CODE DEFINITIONS**

- **TD#**: The code describing the Technical Directive, as provided in TDSA. There are a total of sixteen positions in the alphanumeric field that describes the Technical Directive. The first three letters (positions 1-3) designate the type of aircraft affected by the change. The next two digits (positions 4-5) denote the type of change (50 = airframe change, 54 = avionics change, etc.) The next four digits (positions 6-9) provide the basic TD number. The next character (position 10) identifies an interim change by an "I". The next character (position 11) notes if the order is a revision to a previously issued order. The next number (position 12) provides the amendment number, if applicable. The next two digits (positions 13-14) identify the part number, if the kit was issued in parts. The next letter (position 15) denotes the type of kit (A = basic, B = spares, C = tools, D = special provisions, E/K = trainer, P = GFE supplies.) The last number (position 16) denotes the kit configuration number. If no kit is involved in the directive (e.g., for an administrative change), the last two digits are zeros. Complete definitions for all the code components can be obtained from the Naval Air Maintenance Organization, Patuxent River Naval Air Station.
- **TITLE**: Title of the TD.
- **QTY**: Quantity of modifications performed.
- **AVE**: Average manhours per modification, to date.
- **FUH**: Estimate of first unit installation man-hours.
- **L. CURVE**: Learning curve used to calculate man-hours at unit 100.
- **BETA**: Beta used in learning curve.
- **CAH(100)**: Estimated manhours to install unit 100.
