STAGES AND DISCHARGES

OF THE

MISSISSIPPI RIVER AND TRIBUTARIES

AND

OTHER WATERSHEDS

IN THE

NEW ORLEANS DISTRICT

FOR 1984

ARMY MRC VICKSBURG, MISS

This pamphlet contains the results of stage and discharge observations made on the Mississippi River, its outlets and tributaries, and other streams and waterways in the US Army Engineer District, New Orleans, during the 1984 calendar year.

In addition to the records of this District, there are contained herein gage and discharge data furnished by the US Geological Survey, and gage records furnished by the National Oceanic and Atmospheric Administration.

Gages operated by the New Orleans District are generally inspected at least once each year. The datum used is that of the 1929 National Geodetic Vertical Datum by the National Ocean Survey. Gages are being adjusted to agree with benchmark changes also furnished by the National Ocean Survey. Refer to the General Information section at each station for specific adjustments. Gage readings are checked against inspection reports and comparative hydrographs and are corrected where the need is indicated.

Stages are readings of water surface elevations expressed in feet above the zero or reference point of the gage. The reference point is referred to either National Geodectic Vertical Datum of 1929 (NGVD) or mean low gulf datum. Mean low gulf is 0.78 foot below NGVD. National Geodetic Vertical Datum of 1929 is used in lieu of Sea Level Datum of 1929 (MSL).

Discharge is the quantity of water flowing past a cross section of the stream in a unit of time. It is expressed in cubic feet per second.

Discharge data consist of a brief description of the gaging station, results of discharge observations, and where determined, computed daily flows.

Annual highest and lowest stages are reported for most of the daily gage stations. In determining these extreme records, all available gage data, including continuous recorder charts, twice-daily gage readings, and gage records taken from discharge notes, inspection reports, etc., are used. The time of occurrence usually is reported for the annual highest stage but not for the annual lowest stage.

The time of observation refers to central standard, or central daylight saving time. Daylight saving time was in effect from Apr. 29 through Oct. 28.

The enclosed stream gaging map shows the gaging systems operated by the District during the reporting period. The map contains an index for finding gage and discharge records within the pamphlet by system arrangement.

EUGENE S. WITHERSPOON
Colonel, Corps of Engineers
District Engineer

a Distances of Mississippi River are measured from mouth of Ohio River for the stations north of Cairo, Ill., and from Head of Passes (La.) for the stations south of Cairo. Tributary distances are from mouth. Distances for the stations in the Atchafalaya Basin are from head of Atchafalaya River, via the main channel of the basin to the Gulf. Although some gages have been moved, distances shown refer to their present locations.

b Refers either to pool stage, average low water plane, mean low water, or low water reference plane.

c In some cases, the record stage may be determined from a watermark or from a reading on a local gage, since abandoned. Also, the stage refers to the present zero datum.

d For period from July 1, 1930, to date.

* And also on later dates (in the year).
† Possibly exceeded during period of no record.
‡ Affected by hurricane.
§ And also in later years.
