13. ABSTRACT *(Maximum 200 words)*

Thirty-two years of hindcast wind and wave information is summarized for 53 locations along the shoreline of Lake Erie in four data products: percent occurrence tables, wave rose diagrams, mean and largest wave height and 32-year statistics tables, and return period tables. The procedures used to produce this information are discussed, and examples of verification against measurements are shown.

PREFACE

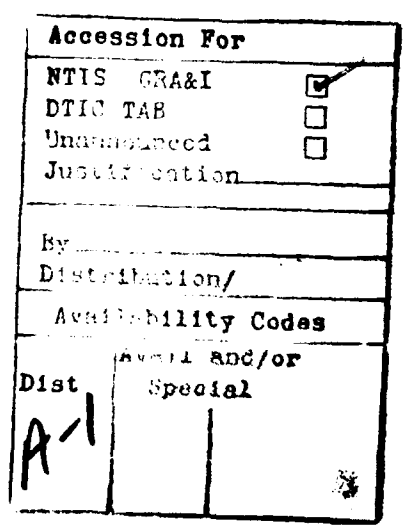

The Wave Information Study (WIS) was authorized in December 1976 by Headquarters, US Army Corps of Engineers (HQUSACE). This study is part of the Field Data Collection Program, which is managed by the Coastal Engineering Research Center (CERC), US Army Engineer Waterways Experiment Station (WES). The HQUSACE Technical Monitors for the Field Data Collection Program are Messrs. John H. Lockhart, Jr.; John G. Housley; James E. Crews; and Robert H. Campbell. Mr. J. Michael Hemsley was the former Program Manager, Ms. Carolyn M. Holmes is the present Program Manager, and Dr. Jon M. Hubertz is the WIS Project Leader.

This report is one of five that present the results of wave hindcasts for the Great Lakes. The Great Lakes hindcasts were performed by Mr. David B. Driver, Dr. Hubertz, and Ms. Robin D. Reinhard, assisted by Mr. Alan Cialone, Ms. Robin Hoban, and Mr. Donald E. Eicher, all of the Coastal Oceanography Branch (COB), Research Division (RD), CERC.

The study was conducted under the direct supervision of Dr. Edward F. Thompson, former Chief, COB; Dr. Hubertz, Acting Chief, COB; Dr. Martin C. Miller, Chief, COB; and Mr. H. Lee Butler, Chief, RD, and under the general supervision of Mr. Charles C. Calhoun, Jr., Assistant Chief, CERC, and Dr. James R. Houston, Chief, CERC. The word processing was by Ms. M. Jane Stauble, COB.

COL Larry B. Fulton, EN, is the Commander and Director of WES. Dr. Robert W. Whalin is Technical Director.

CONVERSION FACTORS, NON-SI TO SI (METRIC) UNITS OF MEASUREMENT

Non-SI units of measurement used in this report can by converted to SI (metric) units as follows:

Multiply	By	To Obtain
degrees (angle)	0.01745329	radians
knots (international)	0.5144444	meters
miles (US statute)	1.609347	kilometers

HINDCAST WAVE INFORMATION FOR THE GREAT LAKES: LAKE ERIE

PART I: INTRODUCTION

1. The primary purpose of this study is to provide an accurate and comprehensive database of information descriptive of the long-term wave climate for the Great Lakes. The goal is to accurately represent mean values of wave parameters such as height, period, and direction. At any station, the hindcast values may at times differ from measured values, but this difference will generally be small and, in the mean, approach zero. It is also expected that the extreme values at any station will accurately represent actual conditions and provide reliable design wave information. This report describes the selection of a grid and hindcast sites, methods used to process and prepare input wind fields, numerical model calibration and verification, and production of a 32-year (1956-1987) hindcast. Information of this nature is essential to the efforts currently being undertaken by both US and Canadian interests in developing workable shoreline management guidelines and navigational aids. Projects benefiting from such information include dredging and dredge disposal, beach nourishment and erosion studies, and the design of coastal structures such as jetties, harbors, revetments, and breakwaters, as well as local projects for improving recreation safety.

2. Prior to 1979, measurements of wave data on the Great Lakes were scarce and quite short in duration. The available data were generally associated with site-specific studies and were usually located nearshore in shallow water. Very few data are available from wave gages, and many of these are in an unanalyzed, analog form. Visual wave observations are available from US Coast Guard stations at several shore locations and from commercial ships for waves offshore.

3. In 1979 the National Data Buoy Center of the National Oceanic and Atmospheric Administration (NOAA) extended their wave measurement program to the Great Lakes, using large, boat-shaped buoys equipped with anemometers, air-water temperature sensors, and vertical accelerometers for wave height measurements. The purpose of this program was to provide a comprehensive set of climatological data for a long period of record from fixed locations in the near coastal and deep ocean areas adjacent to the US mainland. The first two

buoys were installed in northern Lake Michigan and central Lake Superior, respectively. During 1980 and 1981, six additional buoys were deployed: two more in Lake Superior, one in southern Lake Michigan, two in Lake Huron, and one in western Lake Erie. Lake Ontario remains without a buoy.

4. These buoys provide the best long-term wave measurements available for the Great Lakes. Unfortunately, the buoys are removed during the heavy icing season of November to March and are, therefore, subject to miss the winter storms that produce the largest and most destructive waves. Figure 1 shows the location of each of these buoys. Wind and wave information from these buoys were used for calibration and verification of both input wind fields and the numerical wave model.

Previous Studies

5. Prior to this effort, numerical hindcasts of the Great Lakes were conducted by Resio and Vincent (1976a, b, and c; 1977a and b; 1978), hereafter referred to as RV, for the US Army Corps of Engineers (COE) and by a number of Canadian firms for the Ontario Ministry of Natural Resources (1988a, b, and c). The RV study established the hindcast procedure for the Great Lakes that the present study employs, including guidance for the use of measured overland winds to estimate overlake winds. This hindcast was also the first attempt within the COE to use a numerical scheme for wave calculations instead of the standard empirical/analytical approach, such as the Sverdrup-Munk-Bretschneider method (Shore Protection Manual (SPM) 1984). The major differences between RV and the present study are (a) the length of the hindcast period and events hindcast; RV used up to a 69-year record (1907-1975) but only hindcast "storm events," whereas the present study uses a complete 32-year wind record (1956-1987); (b) the present study uses more recent wind information, which, because of improved technology, is of better quality than some of the pre-1950 data; (c) the present study considers the effects of ice cover, whereas the RV study did not, although RV did provide guidance to include ice effects in a probabilistic sense; (d) the present study reflects advances in understanding of the physics involved in wave generation, propagation, and dissipation and employs current techniques to model these processes. The RV classified "storm

events" as days with average wind velocities over the lake of 25 knots* or above, as recorded on the ships' anemometers. Results from RV were tabulated as return period statistics for use in design criteria at hindcast sites along the US coastline. The time series of wind and wave information was not archived.

6. The Canadian hindcasts were developed as part of a Shoreline Management Plan designed to fill the need for a wave climate database for the Great Lakes in Ontario. The approach was similar to that used in the present study. The overlake winds were estimated from several land-based meteorological stations (as per RV), and the presence of ice cover was included. The criterion employed to determine the extent of ice cover is similar to that used for the present study. The Canadian hindcasts produced a wave climate database for stations along the Canadian shoreline that were continuous in time. The time interval of each hindcast varies from 1971-1985 for Lake Erie, 1964-1983 for Lake Ontario, 1962-1970 for Lake Superior, and 1953-1987 for Lake Huron. Lake Michigan was not hindcast. The grid size and number of archived stations are specific for each lake and were selected to provide an accurate representation over the lake with the minimum number of sites. Because of damage during previous storms, shoreline erosion, and existing and proposed developments, these stations were considered priority sites by the Ministry of Natural Resource and Conservation Authority.

Procedure

7. The selection of a grid was based on the grids used previously in the RV study to allow comparison with the present stuay. A 10-statute-mile square grid covering the entire lake was generated. Most of the nearshore and a few midlake grid points were designated as stations at which all model data would be saved (i.e. save stations) (Figure 2). Based on this grid, a land-water boundary matrix was established (0 = land, 1 = water) for computational purposes. Although the model assumes deep water over the entire grid, bathymetric data were input to limit the wave height to 63 percent of the depth. The measured winds from land stations surrounding each lake were converted to an elevation of 10 m after being adjusted for the effects of air-water

* A table of factors for converting non-SI units of measurement to SI (metric) units is presented on page 3.

temperature differences and the land-water interface. These adjustments are discussed in more detail in the following section. The winds were interpolated over the grid at 3-hr intervals.

8. Measured wave data were obtained from NOAA buoys and the Canadian Marine Environmental Data Service (MEDS). Prior to the development of the full 32-year data set, the model was run for selected periods of time (corresponding to available NOAA and MEDS data), and the results were compared with measured data. Wind speeds were then modified, as necessary, as part of the model calibration process. Verification runs were then made for the entire set of available buoy data. Procedures for and results of model calibration and verification are discussed in more detail in subsequent sections.

9. Two data files were created and saved. One, referred to as the parameter file, contains a single record every 3 hr for 32 years for each station. This record includes station identification and location, wave height, peak spectral period, and average wave direction. The second file contains similar information in addition to the full two-dimensional (frequency and direction) distribution of spectral wave energy. The results of various parameter file analysis, including calculation of percent occurrence tables, mean and maximum monthly values, and return period statistics, are presented for the designated save stations. The location and depth of each station is given in Table 1.

PART II: DETERMINATION OF WIND FIELDS

10. The results of any numerical wave hindcast study depend heavily on the quality of the winds used to drive the model and are, therefore, only as good as the input data. In addition to the quality of the wind data, the length of the historical wind record is an important parameter. The longer the period of time that a particular parameter has been observed, the better are any estimates of statistical properties of that population. The only three sources of data with sufficient length of record for the present hindcast are (a) pressure observations at land stations, (b) synoptic weather maps derived from pressure observations, and (c) wind observations at land stations and on ships.

Source

11. The calculation of winds from pressure observations or fields requires the use of a planetary boundary layer model and some simplifying assumptions. Therefore, it was felt that a more straightforward approach should be used. Ship observations were not included because of the inconsistent nature of these measurements in space and time. The incorporation of this information was seen as too time consuming for the present long-term study. Ship wind speeds were used by RV since they addressed only "storm events," which by nature are short in duration. The wind directions recorded by ships were not used in RV since they were often inconsistent.

12. With these factors in mind, estimation of the wind fields over each of the Great Lakes was accomplished by using the most reliable, long-term, continuous wind observations that were available from both US and Canadian coastal land stations. This approach is limited by the distribution of measurement sites around the lakes, but it is considered to be the best alternative. On the US side, these data generally came from National Weather Service stations located at larger airports near the lakes. The Canadian data, supplied by the Canadian Climate Centre (CCC), came from airports and various other CCC weather stations around the lakes. Figure 3 shows the location of the stations used, and Table 2 provides the period of record available for each station. Buoy-measured winds were not included in the following procedure.

13. The wind data, commonly measured and recorded at hourly intervals, were sampled every 3 hr beginning at 00:00 Greenwich Mean Time (GMT) on 1 January 1956. A 3-hr interval was chosen because of the lack of continuous hourly data. Gaps of short duration were interpolated to provide a continuous time series. All data were then corrected to an elevation of 20 m using the standard 1/7th power law for the wind speed profile (Davenport 1960). This approximation, given by

$$U_{20} = U_z\left(\frac{20}{z}\right)^{\frac{1}{7}} \tag{1}$$

estimates the wind speed U_{20} at 20 m from the observed wind speed U_z at elevation z.

Corrections

14. Corrections for the air-water temperature difference and for the difference in frictional effects between land and water were then applied. These corrections were based on two empirical curves developed by RV (1976c), one relating the overland-overlake wind speed ratio to the air-water temperature difference and one relating overlake wind speed (U_w) to overland wind speed (U_l). The approximation of these curves is given by the following formula derived by Schwab and Morton (1984):

$$U_w = U_l\left(1.2 + \frac{1.85}{U_l}\right)\left[1.0 - \frac{\Delta T}{|\Delta T|}\left(\frac{|\Delta T|}{1920}\right)^{\frac{1}{3}}\right] \tag{2}$$

where U_l is given in meters per second at an elevation of 20 m and the air-water temperature difference ΔT is measured in degrees Celsius. Air-water temperature differences derived from ship observations and classified as a function of month and 10-deg direction intervals (Table 3) were obtained from RV (1976c).

15. Overlake winds were then estimated from the measured overland winds using a weighted inverse distance interpolation routine with an r^{-3} spatial weighting function, where r is the distance from the land station to the overwater grid point of interest. The final correction was an additional application of the 1/7th power law to correct the winds to an elevation of 10 m for input into the wave model.

PART III: WAVE MODEL

16. The wave model used in this study, DWAVE, was developed by Dr. Donald T. Resio of Offshore and Coastal Technologies, Inc. It is described in Resio and Perrie (1989) and in an unpublished contractor's report* available from the Wave Information Study (WIS) Project Office.

17. DWAVE is a FORTRAN computer code that simulates wave growth, dissipation, and propagation in deep water. The modeled spectra are represented as fully two dimensional in discretized frequency and direction bands. Propagation effects and source-sink mechanisms are computed in terms of variations of energy levels in each of these frequency-direction elements. All wave parameters, such as wave height, frequency of the spectral peak, and mean wave direction, are computed from these discrete elements. Figure 4 shows how energy is partitioned in a directional spectrum within DWAVE. As seen there, each frequency-direction increment is envisioned as a "bin," and these "bins" are centered on specified frequencies and directions.

18. The physics embodied in DWAVE represents the state of the art in present understanding of wave generation. It is the first discrete-spectral model to be based on an f^{-4} equilibrium range formulation, as supported by almost all past field experiments (Toba 1978, Forristall 1981, Kahma 1981, Kitaigorodskii 1983). As such, it represents the only model (including the third-generation models under development in Europe) that is consistent with energy conservation in the equilibrium range, as calculable from the complete or reduced Boltzmann integrals. The fetch-growth characteristics of DWAVE are similar to the Joint North Sea Wave Project (JONSWAP) relationships, i.e., wave energy increases linearly with fetch; and the duration-growth characteristics are roughly similar to those of Resio (1981) and the US Navy's Spectral Ocean Wave Model (SOWM).

19. DWAVE will run on computers ranging from desktop microcomputers to supercomputers. Many years of model development have led to an understanding of the "trade-offs" between avoiding unnecessary tedious calculations and maintaining numerical accuracy.

---

* D. T. Resio and D. P. Bach, 1989, "Program DWAVE: Global/Regional, Deep-Water Wave Model User's Manual," Offshore and Coastal Technologies, Inc., Vicksburg, MS.

Theoretical Considerations

20. The model is based on the assumption that the wave field on a water body can be represented by a distribution of energy in discrete frequency and direction elements as schematized in Figure 4. The change in energy in each element as a function of time at all specified points on the water body is determined by the radiative transfer equation

$$\frac{\partial E_2(f,\theta)}{\partial t} = \vec{c}_g(f,\theta) \cdot \nabla \vec{E}_2(f,\theta) + \sum_{k=1}^{n} S_k(f,\theta) \qquad (3)$$

where E_2 is the two-dimensional spectral energy at frequency f and direction θ. The group velocity is c_g, and S_k represents a number of functions that act as sources or sinks for energy. This equation is solved at each point in a square grid on the water body for successive intervals in time. The wind source term supplies energy to the sea surface and allows the wave spectrum to grow, and the wave-wave interaction term controls development of the spectrum.

21. Hasselmann (1962) derived an equation for four resonantly interacting waves, which he showed to be the lowest order interaction capable of achieving a net transfer of energy among spectral components in a statistically homogeneous wave field. Although Hasselmann et al. (1973, 1976) argued that these wave-wave interactions controlled the shape of a spectrum, they did not pursue the spectral balance responsible for this tendency. Tracy and Resio (1982) showed that a number of exact geometric similarities were exhibited within the collision integrals for wave-wave interactions; however, they made use of these similarities only to improve the efficiency of numerical integration for the full integral. Only recently Kitaigorodskii (1983) demonstrated that inherent in the collision integrals for wave-wave interactions are geometric constraints on the gradient of energy density in the equilibrium range of a spectrum. Kitaigorodskii pointed out the analogue between this "equilibrium" range behavior and the Komolgoroff range in turbulence. Kitaigorodskii's derivation is based solely on dimensional arguments and does not illustrate some of the important geometric scaling aspects inherent in the collision integral. A different derivation, one which follows the scaling aspects of this integral, is offered by Resio (1981).

22. This derivation implies that an equilibrium range in action density in a deepwater wave spectrum is representable as

$$n(\underline{k}) = B'k^{-4} \tag{4}$$

where B' is a constant with units time^{-1} and k is the wave number. Equation 4 is equivalent to that derived by Kitaigorodskii (1983), although the two methods of derivation differ significantly. Figure 5, from numerical calculations using the full collision integral, shows that, in deep water, an equilibrium range with this form does come very close to a constant energy flux equilibrium form. Flux divergence, which would produce steeper equilibrium range slopes, will occur for values of the power of k less than 4; and flux convergence, which would produce shallower equilibrium range slopes, will occur for values of the power of k greater than 4. Thus, there is a strong shape restoring-preserving tendency inherent in these energy fluxes due to wave-wave interactions.

Wave Propagation

23. In DWAVE, each frequency-direction element in the directional wave spectrum is propagated independently, according to an upstream differencing method. This technique is presently employed in the latest third-generation models in Europe. Its advantages in terms of stability, execution time, and set-up simplicity outweigh any gains by using higher order propagation schemes. During the development phase of DWAVE, several higher order propagation schemes were tested in actual wave simulations. Typical differences in spectral energy contents and total energies, under these "real-world" conditions, were typically only a few percent or less.

24. A latitude-longitude grid is used in DWAVE. Propagation along meridians (or components of propagation along meridians) is the equivalent of propagation along great circles. Consequently, there is no curvature away from a straight-line propagation along these axes; however, divergence/convergence effects must be incorporated for meridional propagation. For propagation along latitudes (parallels), there is no divergence/convergence; however, there is an angular curvature that must be considered.

Numerical Simulation of Wave Growth and Dissipation

25. The proper simulation of the physics of energy transfer into and out of each element in the directional spectrum is essential to accurate wave modeling. In DWAVE, the simulated sources and sinks are as follows:

a. Energy transfer from the atmosphere to the wave field.

b. Energy transfer among wave frequencies (wave-wave interactions).

c. Energy transfer from waves to the atmosphere (swell propagating against the wind).

d. Energy losses due to wave breaking in deep water.

Wind Input

26. The energy input into the spectrum is given by

$$\frac{\partial E_2(f,\theta)}{\partial t} = B(f,\theta)\,E_2(f,\theta) \tag{5}$$

where $B(f,\theta)$ is a function with units of time^{-1} given by

$$B(f,\theta) = z\left(\frac{uf_m}{g}\right)f\cos(\theta_{wv} - \theta_{wd}) \tag{6}$$

where

f = frequency

z = dimensionless constant

u = wind speed

f_m = peak frequency

g = acceleration of gravity

θ_{wv} = wave direction

θ_{wd} = wind direction

The constant z is composed of the drag coefficient, the ratio of air density to water density, and an empirical constant and should have a value between 0.16 and 0.24. The value used in this study is 0.2.

Description of Wave Growth and the Behavior of the Wave-Wave Interaction Source Term

27. From Hasselmann et al. (1973), Mitsuyasu (1968), and others, the following is obtained

$$\hat{E}_0 = J\hat{x} \tag{7}$$

where J is a dimensionless empirical constant. Nondimensional values of energy $\hat{E}_0$ and fetch $\hat{x}$ are given by

$$\hat{E}_0 = E_0 \frac{g^2}{u_*^4} \tag{8}$$

and

$$\hat{x} = \frac{gx}{u_*^2} \tag{9}$$

where

E_0 = total wave energy

u_* = friction velocity

x = fetch

The constant J ranges in value from 1.0×10^{-4} to 1.5×10^{-4}. The value used in this study is 1.28×10^{-4}. Substituting the definitions of $\hat{E}_0$ and $\hat{x}$ into Equation 7 and taking a derivative with respect to distance for the equation, the following is obtained:

$$\frac{\partial E_0}{\partial x} = J\frac{u_*^2}{g} \tag{10}$$

Thus, Equation 10 indicates that the rate of gain of energy with fetch is independent of fetch. Converting to a time rate of growth,

$$\frac{\partial E_0}{\partial t} = \langle c_g \rangle J\frac{u_*^2}{g} \tag{11}$$

where $\langle c_g \rangle$ is an average group velocity such that

$$\langle c_g \rangle = \frac{1}{E_0} \int_0^{\infty} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \vec{E}_2(f,\theta) \cdot \vec{c}_g d\theta df \tag{12}$$

If a parameter, β_1, is defined such that

$$\beta_1 c_{gm} = \langle c_g \rangle \tag{13}$$

where c_{gm} is the group velocity of waves at the spectral peak (i.e., $c_g(f_m)$ where f_m is the frequency of the spectral peak), Equation 11 becomes

$$\frac{\partial E_0}{\partial t} = \beta_1 c_{gm} J \frac{u_*^2}{g} \tag{14}$$

In discrete spectral models, the radiative transfer equation,

$$\frac{\partial E_2(f,\theta)}{\partial t} = \vec{c}_g(f,\theta) \bullet \nabla \vec{E}_2(f,\theta) + \sum_{k=1}^{n} S_k(f,\theta) \tag{15}$$

where $S_k(f,\theta)$ represents energy input or loss at a spectral element with frequency f and direction θ due to the kth source term, is solved at every time step for each water point in the computational grid. In order to estimate important spectral balances and energy exchanges due to nonlinear wave-wave interactions, it is essential to know the location of the spectral peak. In the previous WIS model, as described by Resio (1981), the nonlinear wave-wave interaction source term is treated explicitly. A problem with this approach is that the location of f_m actually evolves during each time step and an explicit treatment which holds it constant over a time step can lead to significant underprediction of wave period.

28. To obtain an implicit representation for nonlinear source terms, begin by expressing the total energy in a spectrum in terms of a set of spectral parameters in a manner consistent with Equation 2.6 of Resio and Perrie (1989),

$$E_0 = \frac{1}{3} \lambda \alpha g (u_*^2 c_m)^{1/3} f_m^{-3} \tag{16}$$

where λ is a constant of proportionality and ranges in value from 1.5 to 2.0 and c_m is the phase velocity of the spectral peak. The value used in this study is 1.75. The constant α ranges in value from 0.035 to 0.05. The value used in this study is 0.045. This relationship is appropriate for self-similar spectra with an f^{-4} equilibrium range. As discussed by Resio and

Perrie (1989), spectra of this type can be written in a fashion analogous to the form of the JONSWAP spectrum, i.e.

$$E(f) = \alpha \frac{(u_*^2 c_m)^{\frac{1}{3}} g}{(2\pi)^3} f^{-4} \Psi\left(\frac{f}{f_m}\right) \tag{17}$$

where

$$\Psi\left(\frac{f}{f_m}\right) = \gamma^{\exp\left[-\frac{(f-f_m)^2}{2(\sigma f_m)^2}\right]} \quad for\ f \geq f_m \tag{18}$$

or

$$\Psi\left(\frac{f}{f_m}\right) = E(f_m) \exp\left[1 - \left(\frac{f}{f_m}\right)^4\right] \quad for\ f < f_m \tag{19}$$

and γ and σ are the JONSWAP coefficients. From the form of Equations 17, 18, and 19, it is apparent that the parameter λ is dependent on γ and σ in a fairly nonlinear fashion; however, the actual variability for reasonable values of γ and σ constrain λ to be somewhere between 1.5 and 2.0, so the net effect of variations in γ and σ is not too large. In DWAVE, the value of λ is set at a constant 1.76.

29. Returning to Equation 16 and making use of the deepwater definitions of phase and group velocities, i.e.

$$c = \frac{g}{2\pi f} \quad ; \quad c_g = \frac{g}{4\pi f} \tag{20}$$

gives

$$E_0 = Q_1 f_m^{-10/3} \tag{21}$$

where

$$Q_1 = \frac{\lambda \alpha_*}{3(2\pi)^{10/3}} u_*^{2/3} g^{4/3} \tag{22}$$

and α_* is α divided by the square root of the drag coefficient, and from Equation 14,

$$\frac{\partial E_0}{\partial t} = J\beta_1 \frac{g}{4\pi} \frac{u_*^2}{g} f_m^{-1} \tag{23}$$

If $R = f_m^{-10/3}$, then Equation 23 becomes

$$\frac{\partial Q_1 R}{\partial t} = J\beta_1 \frac{g}{4\pi} \frac{u_*^2}{g} R^{3/10} \tag{24}$$

Separating the variables and integrating yields

$$\frac{10}{7}\left(R^{7/10} - R_0^{7/10}\right) = \frac{J\beta_1}{Q_1 4\pi} u_*^2 (t - t_0) \tag{25}$$

where the subscript "0" refers to initial conditions at time t_0. Rearranging and substituting f_m back into Equation 21 yields

$$f_m^{-7/3} = f_m^{-7/3}\Big|_{t_0} + \frac{7}{10} \frac{J\beta_1 u_*^2}{Q_1 4\pi} (t - t_0) \tag{26}$$

If all dimensional quantities are factored out, then the change in f_m over a time step is given as

$$f_m^{-7/3}\Big|^{n+1} = f_m^{-7/3}\Big|^{n} + \frac{J\beta_1}{\lambda \alpha_*} Q_3 \left(\frac{u_*}{g}\right)^{4/3} (t - t_0) \tag{27}$$

where the superscripts "n" and "$n+1$" refer to time-step counters and

$$Q_3 = \left(\frac{7}{10}\right) \frac{3(2\pi)^{10/3}}{4\pi} \tag{28}$$

Thus, the rate of change of f_m can be seen to depend on four parameters, J, λ, α_*, and β_1. Each of these parameters can be defined independently, J and α on an empirical basis and λ and β_1 from numerical constraints.

30. Equation 23 expresses a fundamental law for active wave generation. This can be converted into a nonlinear source term by equating S_{NL} to differences in energy densities

$$S_{NL}(f,\theta) = [\hat{E}(f)|^{n+1} - \hat{E}(f)|^{n}]\Phi(\theta - \theta_0) \tag{29}$$

where $\hat{E}(f)$ is the estimated value of the one-dimensional spectral density $E(f)$, $\Phi(\theta - \theta_0)$ is an angular function, and θ_0 is the mean wave propagation direction. The approach to a fully developed sea can be modeled by introducing a limiting parameter such that

$$T_m|^{n+1} = T_m|^{n} + p\frac{\partial T_M}{\partial t}\Delta t \tag{30}$$

where T_m is the peak period and p is given by

$$p = 1 \text{ if } f_m > f_{PM}$$

$$= 0 \text{ if } f_m \leq f_{PM}$$

and f_{PM} is the "fully" developed peak frequency given by

$$f_{PM} = Z_c \; g/(2\pi u)$$

where Z_c is a dimensionless empirical constant (taken as 0.9 in DWAVE).

31. Swell decay in this model is based on the concept of energy loss by nonlinear fluxes. In this form, the total energy flux from the "rear-slope" portion of the spectrum is estimated as

$$\Gamma_E = \left[\frac{a_1(2\pi)^9}{g^4}\right]E_0^3 \; f_m^9 \tag{31}$$

where a_1 is a dimensionless empirical constant that ranges in value from 0.35 to 2.0. The value used in this study is 0.40. An explicit scheme is used to estimate the energy loss over the time step, and a part of the energy is redistributed to the forward face. A schematic of S_{NL} is shown in Figure 6 from Resio and Bach.*

32. In summary, DWAVE is a computer code that simulates the growth, propagation, and decay of wave energy as a function of space, time, frequency, and direction. Wave growth occurs through transfer of energy from the wind to the sea surface. Part of this energy results in surface gravity waves. As energy continues to flow into the spectrum, wave-wave interactions transfer energy from the midrange portion of the spectrum to both the forward face and

---

* Resio and Bach, op. cit.

high-frequency regions. For constant wind input, eventually an equilibrium of energy versus frequency is reached. Wave energy is propagated in space through time as a function of frequency and direction of each of the discrete energy packets.

PART IV: MODEL CALIBRATION

33. Most numerical wave models require a certain amount of fine-tuning, or calibration, when first applied to a particular area. A model can be calibrated in several ways, including adjustment of certain internal parameters that control processes such as wave growth, propagation, and dissipation; adjustment of external parameters, such as input wind fields; or a combination of both. To determine if, and to what degree, the model used in the present study required calibration, modeled winds and waves taken from the grid point closest to the buoy location were compared with the same buoy-measured parameters for the period June-December 1980. Stated accuracy for the measured parameters is ±0.2 m, or 5 percent, for wave height; ±1.0 sec for spectral peak period; ±1.0 m/sec, or 10 percent, for wind speed; and ±10 deg for wind direction (Gilhousen et al. 1990). Time-series plots and percent distribution histograms of measured (Buoy 45005) versus modeled (WIS Sta 5) wind speed, wave height, and peak spectral wave period were examined. Figure 7a shows that the distribution of wind speed is significantly different, with the buoy exhibiting a larger (21 versus 10) percentage of wind speeds less than 4 m/sec, a considerably lower (39 versus 65) percentage of speeds between 4 and 6 m/sec, and a larger (40 versus 25) percentage of speeds greater than 6 m/sec. The resulting wave height distribution plot (Figure 7b) reflects the differences exhibited by the winds, particularly at the extremes. A difference in the distribution of peak periods is evident (Figure 7c), but not as dramatic.

34. Given the inherent problems in assimilating wind data from irregularly spaced (both spatial and temporal) observations and in determining how best to blend all the available data, it was felt that the input wind field was the most "free" parameter to vary for model calibration. The best approach was determined to be an adjustment to the input (modeled) wind speeds that would force a closer match to the measured wind speed distribution. For Lake Erie, this adjustment took the form:

$$y = 1.53x - 2.44 \quad for \quad 2\ m/sec < x \leq 4m/sec$$
$$y = 1.37x - 1.28 \quad for \quad x > 4m/sec \tag{32}$$

relating measured (y) and modeled (x) wind speeds. Speeds less than 2 m/sec were changed to 0.5 m/sec. The effect was to re-distribute the

modeled wind speeds, resulting in the distribution shown in Figure 8a. Wind directions were unchanged. This improved agreement (<4 m/sec, 21 versus 21 percent; 4 to 6 m/sec, 39 versus 40 percent; >6 m/sec, 40 versus 39 percent) in wind speeds resulted in the corresponding improvement in the wave height and peak period distributions shown in Figures 8b and 8c. Figures 9a and 9b are examples of time-history comparison plots of wave height and peak period using the adjusted wind speeds as input to the model. Tables 4 and 5 provide the various statistical parameters for all data from 1980. Based on this improved agreement, the above procedure was considered sufficient and was used for the entire 32-year hindcast.

PART V: VERIFICATION

35. An important question to ask in any study involving numerical models, whether used for hindcasting purposes as in the present study or as a forecasting tool, is, "How well does the simulated data reproduce, or predict, what has, or what will, occur?" The ability to answer this question with any degree of confidence depends on the availability and quality of field measurements within the study area. As was pointed out in the introduction, wave height measurements on Lake Erie prior to the installation of the NOAA buoy were scarce. The earliest source of available data is Coastal Engineering Research Center (CERC) gage data obtained during several short-term measurement programs in 1975 and 1976. Unfortunately, the data were so sparse and sporadic that they were deemed unusable for verification purposes.

36. The main source of verification data is the NOAA buoy which, at the time of this study, had provided data for varying portions of 7 years (1980-1986). In an effort to verify both the model and the corrections made to the input wind speeds, a procedure similar to that carried out for the calibration phase was undertaken. All available buoy data, including winds, from 1980 to 1986 were compared, using percent distribution as a guideline, to hindcast data from the same time and place. Figures 10a, b, and c show percent distributions for measured (Buoy 45005) versus modeled (WIS Sta 5) wind speed, wave height, and peak spectral wave period. Agreement between each set of distributions is quite good. The largest difference in wave heights is seen to occur at the 0.15-m range (Figure 10b), where measured exceeds modeled by approximately 9 percent. This difference is most likely the result of larger percent occurrence values for measured wind speeds in the 3- to 5-m/sec range (Figure 10a). Figures 11 and 12 show representative samples of time-history comparison plots. In general the agreement is good, although there seems to be a tendency for the model to underpredict the peaks. Tables 6 and 7 contain the wave height and peak period statistics for the 7-year period. The mean and maximum values agree very well. For comparison purposes, the data shown in Figure 9a have a correlation coefficient of approximately 0.7, similar to that for the entire wave height data set. Peak period is a characteristically unstable parameter, particularly during times of low wave energy, and would be expected to produce rather low correlation.

37. Although the NOAA buoy provided much needed information for the calibration of the winds and the verification of hindcast wave heights and

periods, it provided no information on wave direction. Directional wave measurements on the Great Lakes are rare, making verification of modeled wave direction difficult. Fortunately, a field experiment jointly conducted by NOAA's Great Lakes Environmental Research Laboratory (GLERL) and the University of Michigan during the fall of 1981 provided a small but valuable data set of measured wave parameters, including direction. The data are from a research tower located approximately 6 km off the southeast shoreline of Lake Erie (see Figure 3). Statistics for modeled and measured wave heights and periods are provided in Tables 8 and 9, while Figures 13 through 15 show time-history comparisons and scatterplots for wave height, period, and direction. Table 8 reveals an overestimation of modeled wave heights, although agreement between the maximum modeled and observed wave height is very good. Peak periods show reasonable agreement, exhibiting no real bias. Of particular interest is the information contained in Figure 15c, showing modeled-versus-measured wave directions. All directions are measured clockwise from True North and are "coming from" the stated value. The agreement seems reasonably good for directions greater than 180 deg, but between 0 and 180 deg, there is considerable disagreement. A possible explanation for this result can be found by examining Figures 16 and 17 and by considering the geometry of Lake Erie. Figure 16 is a plot of modeled wind versus modeled wave directions. The results indicate that, in general, the model produces waves moving in the same direction as the wind. A possible exception is seen for wind directions of 180 to 225 deg (offshore), where the corresponding wave directions are often shifted to the 225 to 270-deg band. Figure 17 is a plot of measured wind versus measured wave directions. It agrees reasonably well with Figure 16 for wind directions greater than 180 deg, but rather poorly for wind directions between 90 and 180 deg, where it shows rather large deviations between wind and wave directions. Waves produced under these circumstances are fetch-limited and, according to Donelan (1980), may diverge considerably from the wind direction towards the long fetch direction. For Lake Erie, the maximum fetch directions are east-northeast and west-southwest, directions that seem to be favored in the measured data. This phenomenon may account for the deviations exhibited in Figures 16 and 17. The lack of any deviation for wind directions between 90 and 180 deg in Figure 16 is under investigation, but is most likely the result of the way fetch-limited conditions are handled in the model. In addition, the measured data may reflect bottom effects that are absent from the deepwater model results. The differences exhibited

between Figures 16 and 17, for whatever the reasons, explain the disagreement in Figure 15c for wind directions between 0 and 180 deg.

38. Based on the results of the calibration and verification phases, it is believed that the hindcast data are within the stated accuracy of the measured parameters and therefore represent a reliable estimate of the actual wave conditions.

PART VI: ESTIMATION OF ICE CONCENTRATION

39. Lake Erie, the shallowest of the five Great Lakes with a mean depth of 19 m, can essentially be divided into three basins: the shallow western basin situated west of Point Pelee, the deeper central basin located between Point Pelee and Long Point, and the deepest eastern basin lying east of Long Point. In addition to being the shallowest, Lake Erie also has the smallest volume of all the Great Lakes. The combination of these factors allows the temperature of the lake to respond very quickly to changing atmospheric conditions. During a "normal" Great Lakes winter, the ice cover on Lake Erie generally exceeds 90 percent. One obvious effect of this extensive icing over is a reduction in the size of the lake, resulting in both the elimination of some or all of the 53 stations of interest and a significant change in the open water available for wave generation. The number and location of stations either lost or impacted by the reduced fetch depend on whether it is early, middle, or late winter.

40. Given the high percentage of ice coverage experienced by Lake Erie during a normal winter, any effort to develop a long-term wave database would be incomplete without including the resulting effects. To accomplish this, additional model runs using ice-modified, land-water boundary data were made for the same 32-year period as the open-water hindcast.

41. Land-water matrix modification was made possible by using an extensive, 20-winter, digital data set compiled by the Great Lakes Environmental Laboratory (GLERL) of the NOAA (Assel et al. 1983). This database consists of ice concentration observations, beginning in the winter of 1960 and including all of the Great Lakes, made by both US and Canadian government agencies. The data are partitioned into nine half-month intervals starting with the latter half of December. Ice concentration values are given in increments of 10 percent from 0 (open water) to 100 (total ice cover) for individual grid cells measuring 5 km square.

42. The GLERL analyzed each half-month data set to provide the maximum, minimum, average, median, and modal ice concentrations for each 5-km cell. The median value, which represents an estimate of the 50-percent point of the ice concentration probability distribution, is referred to as the "normal" winter ice concentration. This particular statistical value was chosen because it was "subjectively determined that the median ice concentration patterns provided the most coherent pattern of the progression of ice-cover

formation and decay over the winter season" (Assel et al. 1983). It was decided, therefore, that the GLERL-derived, median ice concentration values for each of the nine half-month time periods would provide the best data for modifying the original land-water boundary matrix.

43. The procedure for incorporating the progression and decay of the time-dependent ice cover was complicated by the fact that different grid cell sizes were used for mapping the ice concentration (5 by 5 km) and for hindcasting the waves (16 by 16 km). To facilitate a direct relationship, ice-concentration values from a block of nine grid cells (three by three) were averaged to produce one value corresponding to a cell that was approximately the same size as a hindcast grid cell. If the ice-concentration value in this larger cell was 50 percent or greater, it was considered, for modeling purposes, to be totally covered, and the corresponding hindcast grid point was changed from a water point to a land point.

44. This procedure resulted in the formation of nine half-month land-water boundary matrices reflecting the various stages of ice-cover development and decay (Figures 18a-i). The hindcast model was then re-run for the 32-year period, using the appropriate matrix for each date. The results were again summarized in the form of percent occurrence tables, mean and maximum monthly values, and return period statistics.*

* Appendices C (Summary Tables, Ice Conditions) and D (Return Period Tables, Ice Conditions) are available for loan by request from the WES Technical Information Center Library or the WIS Project Office, USAE Waterways Experiment Station, 3909 Halls Ferry Road, Vicksburg, MS 39180-6199.

PART VII: EXPLANATION OF SUMMARY TABLES

Percent Occurrence Tables

Description

45. Two types of tables are printed: azimuth tables and tables for all directions. The azimuth tables give the percent occurrence of waves in height and period ranges for specified direction bands at each station. The title of each table provides station identification and azimuth, or midpoint angle for each of the sixteen 22.5-deg direction bands (Table 10). The period ranges were derived from the period ranges available from the WIS hindcast model (Table 11), and the height ranges are in 0.25-m increments. Values in the azimuth tables represent the percentage of the 32-year period during which waves occur from the specified azimuth range for the indicated height and period ranges. The values have been multiplied by 1,000 to allow more accuracy while using less printing space. Summations of period and height ranges are provided in the last column and row of each table. The summations also have been multiplied by 1,000. The last line in each azimuth table contains the following information for the specified azimuth range and station:

a. The mean wave height H .

b. The largest H .

c. The mean spectral peak period T_p .

d. The number of cases (wave occurrences computed at 3-hr intervals over the length of the hindcast for that direction band).

46. The all-directions table for each station is printed following the 337.5-deg azimuth table for each station. This table gives the percent occurrence of waves within specified height and period ranges coming from all directions. Values in the all-directions table are multiplied by 100. The parameters listed in the last line of the table are derived from all directions for the full 32 years, and the total number of cases (93,504) is the number of cases calculated in the 32 years analyzed.

Use of the tables

47. The tables have been developed to produce the most detailed information available in a summary report.

Example

48. To find the number of hours that waves of 0.50 to 0.74 m and 3.0 to 3.9 sec are expected to occur from the 292.5-deg band at Sta 1 for the 32-year interval, the value read in the table for the specified station, azimuth, height, and period should first be divided by 1,000, which for this example yields 2.483 percent (Appendix A). Then 2.483 is divided by 100 to give the probability (0.02483) and multiplied by the number of hours for the 32-year interval (93,504 cases times 3 hr = 280,512 hr) to yield the number of hours that the specified wave is expected to occur. The simple conversion process is:

$$\frac{\text{Value read in table}}{1{,}000 \times 100} \times \text{number of hours in time interval} = \text{number of hours specified wave is expected to occur}$$

For this example:

$$\frac{2.483}{1{,}000 \times 100} \times 280{,}512 \text{ hr} = 6{,}965 \text{ hr}$$

Wave Rose Diagrams

Description

49. The wave rose diagrams use wave height H and wave direction D and present analyses of the 32 years of hindcast data. The diagrams show the percent occurrence of H ranges from eight (45-deg) direction bands. The percentage of waves occurring from each direction for the specified station is displayed in a triangle at the end of each leg of the diagram.

50. As in most wave rose diagrams, the width of each bar segment indicates the H range, and the length of the bar segment indicates the percent occurrence of waves from the specified direction. The distance between each circle in the diagram is 20 percent. Each leg of the diagram represents 22.5 deg to either side of the primary direction of the leg. For example, the leg to the north represents waves coming from 337.5 deg (NNW) through 0 deg (N) to 22.5 deg (NNE).

Use of the diagrams

51. The diagrams are intended as visual aids and are not appropriate for detailed analyses.

Example

52. The wave rose diagram for Sta 1 (Appendix A) indicates that 10 percent of the waves were from the east, 90-deg band (waves moving east to west), and of the 10 percent, approximately 38 percent were 0.0 to 0.4 m, about 42 percent were 0.5 to 0.9 m, about 18 percent were 1.0 to 1.4 m, etc. The total for each leg is 100 percent for the specified direction.

Mean H , Largest H , and 32-Year Statistics Tables

Description

53. Two tables that summarize the mean and largest H for each month and year are provided for each station (Appendix A). The mean table also provides a mean monthly value and mean yearly value of H . The largest H table provides the largest H hindcast for each month in each year. The 32-year statistics tables provide the following:

a. Mean H .

b. Mean T_p .

c. Most frequent D band.

d. Standard deviation of H .

e. Standard deviation of T_p .

f. Largest H .

g. T_p of largest H .

h. D of largest H .

i. Date and time (GMT) of largest H .

Use of the tables

54. The tables can be used as a quick reference in determining estimates of the wave climate in an area.

Example

55. To determine the mean H at Sta 1 for January 1956, simply read the value in the specified column and row (Appendix A). The mean H for 1956 is given in the MEAN column opposite 1956. The mean H for all January's is given in the MEAN row under JAN. For this example:

a. The mean H for JAN 1956 = 0.5 m.

b. The mean H for 1956 = 0.6 m.

c. The mean H for all JAN's = 0.6 m.

The largest H table can be read in a similar fashion, and by scanning the columns and rows, additional information can be determined:

a. The largest H for JAN 1956 = 1.2 m.

b. The largest H for 1956 = 1.6 m.

c. The largest H for all JAN's = 2.1 m.

Return Period Tables

Description

56. An analysis of extreme storm wave heights was performed for each of the save stations. The procedure, developed by Goda (1988) and currently available in CERC's Automated Coastal Engineering System, fits five candidate probability distributions to a series of ranked extreme wave heights. In the present study, a Fisher-Tippett Type I distribution was chosen because it provided the best overall match to the input data. The 32-year extremal statistic tables (Appendix B) are in the following format:

a. Wave heights for recurrence intervals of 2, 5, 10, 20, and 50 years are listed.

b. The standard error of wave height for the specified return period is included in parentheses next to each wave height estimate.

c. Angle Classes 1, 2, and 3 are defined as viewed by an observer on shore (Figure 19):

(1) Angle Class 1 - Mean wave approach angle greater than 30 deg to right of normal to shore.

(2) Angle Class 2 - Mean wave approach angle within 30 deg to either side of normal to shore.

(3) Angle Class 3 - Mean wave approach angle greater than 30 deg to left of normal to shore.

(4) Angle Class All - includes all directions.

57. Table 12 lists the azimuths of the vectors normal to the shoreline for each station.

Use of the table

58. Estimates of extreme wave heights and their standard errors can simply be read from the table for the desired return period and station. Table 13 provides the factor by which the standard error should be multiplied to obtain bounds for various levels of confidence and the corresponding

probability of exceeding the upper bound. Table 14 can be used to find the probability of one or more waves, or larger waves, of a specified return period occurring within 1, 10, 25, or 50 years.

Example

59. Wave height values for specified return periods are simply read from the table for the desired station. For example, the 50-year maximum for Sta 1, Angle Class 1, is 2.0 m. The 50-year maximum for Sta 1, all directions, is 2.5 m. Table 14 shows that the 2.5-m extreme wave height has a probability of 0.18 of being equaled or exceeded at least once in 10 years.

PART VIII: RESULTS

60. A 32-year time series of historical wave heights, periods, and directions has been developed for Lake Erie using the latest version of CERC's deepwater wave model. The data presented in this report, in the form of graphs and tables, serve to verify the hindcast procedure as well as present a concise and useful summary of a very large data set.

61. Information contained in this report can be quite useful for initial assessments, but users must keep in mind that the results from this hindcast represent deepwater conditions, and, as such, should be used only as approximations to coastal conditions. For detailed coastal wave information, such as that required for the design, construction, operation, and maintenance of coastal structures, one must take advantage of the full two-dimensional spectrum (available on magnetic tape) from the nearest deepwater point and use an appropriate shallow-water wave transformation model to bring the waves to the point of interest.

62. One of the more important parameters reported is the return period wave height. It is often this extreme value that guides the design of many coastal structures, such as selection of the appropriate rock size for a jetty or breakwater. Coastal engineers, both within the COE and in the private sector, responsible for the design of coastal structures on the Great Lakes have relied heavily on the results of RV for estimates of extreme waves. The return period wave heights estimated in this study were compared with those reported in RV. The results, shown in Figures 20a-d and in Table 15, compare the wave heights at co-located stations for return periods of 5, 10, 20, and 50 years, respectively. Each plot shows three distinct regions of varying agreement, roughly corresponding to the three different basins. Sta 47, 1, 2, and 3 are located in the shallow, western basin, where the extreme wave heights estimated in the present study (WIS) are always lower than the RV estimates. Sta 6 through 16, located in the central basin, exhibit the best agreement between two estimates, with the 5- and 10-year WIS values biased slightly high and the 20- and 50-year WIS values biased slightly low. Sta 17 through 25 are, for the most part, located in the eastern basin. It is this region that shows the greatest divergence in extreme wave height estimates, with WIS values exceeding RV values by as much as 1.5 m. It is felt that the WIS estimates are more realistic given the fetch lengths involved and the nature of the storms that pass over the area. As an example, the SPM (1984)

nomograms of deepwater wave height prediction suggest that Sta 20, with an estimated fetch of 240 km to the southwest, could experience a 6.0-m wave given a wind speed of 28 m/sec blowing for approximately 8 hr. This agrees quite well with the WIS estimate of 6.4 m reported for the 50-year return period at Sta 20. Although these curves are for monochromatic wave conditions, they do serve to indicate that the return period wave heights estimated in the present study are realistic and that, perhaps, the RV estimates for these stations are low.

32 YR. STATISTICS FOR WIS STATION E52

MEAN SIGNIFICANT WAVE HEIGHT	(METERS)	0.8
MEAN PEAK WAVE PERIOD	(SECONDS)	4.0
MOST FREQUENT 22.5 DEGREE (CENTER) DIRECTION BAND . .	(DEGREES)	180.0
STANDARD DEVIATION OF WAVE HS	(METERS)	0.5
STANDARD DEVIATION OF WAVE TP	(SECONDS)	1.1
LARGEST WAVE HS	(METERS)	3.6
WAVE TP ASSOCIATED WITH LARGEST WAVE HS	(SECONDS)	8.0
AVERAGE DIRECTION ASSOCIATED WITH LARGEST WAVE HS . . .	(DEGREES)	34.0
DATE OF LARGEST HS OCCURRENCE IS (YR,MO,DA,HR)		82040609

STATION E53 41.73N 82.30W AZIMUTH(DEGREES) = 0.0

32 YR. STATISTICS FOR WIS STATION E53

MEAN SIGNIFICANT WAVE HEIGHT	(METERS)	0.9
MEAN PEAK WAVE PERIOD	(SECONDS)	4.1
MOST FREQUENT 22.5 DEGREE (CENTER) DIRECTION BAND	(DEGREES)	202.5
STANDARD DEVIATION OF WAVE HS	(METERS)	0.5
STANDARD DEVIATION OF WAVE TP	(SECONDS)	1.1
LARGEST WAVE HS	(METERS)	4.2
WAVE TP ASSOCIATED WITH LARGEST WAVE HS	(SECONDS)	8.0
AVERAGE DIRECTION ASSOCIATED WITH LARGEST WAVE HS	(DEGREES)	253.0
DATE OF LARGEST HS OCCURRENCE IS (YR,MO,DA,HR)		56030821

APPENDIX B: RETURN PERIOD TABLES

Station 1 (41.73N , 83.27W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	1.7(0.02)	2.0(0.02)	1.7(0.03)	2.1(0.03)
5.00	1.8(0.03)	2.1(0.03)	1.8(0.05)	2.2(0.04)
10.00	1.9(0.04)	2.2(0.04)	1.9(0.06)	2.3(0.05)
20.00	1.9(0.04)	2.2(0.05)	2.0(0.07)	2.4(0.06)
50.00	2.0(0.05)	2.3(0.05)	2.1(0.08)	2.5(0.07)

Station 2 (41.73N , 83.08W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	2.2(0.02)	2.2(0.03)	2.2(0.05)	2.4(0.04)
5.00	2.3(0.03)	2.3(0.04)	2.4(0.07)	2.6(0.06)
10.00	2.4(0.04)	2.4(0.05)	2.5(0.08)	2.7(0.07)
20.00	2.5(0.05)	2.5(0.06)	2.6(0.09)	2.8(0.08)
50.00	2.5(0.06)	2.6(0.07)	2.8(0.11)	2.9(0.10)

Station 3 (41.73N , 82.88W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	2.1(0.03)	2.3(0.03)	2.3(0.04)	2.5(0.03)
5.00	2.2(0.04)	2.4(0.04)	2.5(0.05)	2.6(0.04)
10.00	2.3(0.04)	2.5(0.04)	2.6(0.06)	2.7(0.05)
20.00	2.4(0.05)	2.5(0.05)	2.7(0.07)	2.8(0.06)
50.00	2.5(0.06)	2.7(0.06)	2.8(0.09)	2.9(0.07)

Station 4 (41.58N , 82.88W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	1.8(0.02)	1.8(0.02)	1.9(0.03)	2.0(0.03)
5.00	1.9(0.03)	1.9(0.03)	2.0(0.04)	2.1(0.04)
10.00	1.9(0.03)	2.0(0.04)	2.1(0.05)	2.1(0.05)
20.00	2.0(0.04)	2.0(0.05)	2.2(0.06)	2.2(0.05)
50.00	2.1(0.05)	2.2(0.06)	2.3(0.07)	2.3(0.06)

Station 5 (41.73N , 82.50W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	2.8(0.03)	2.2(0.04)	2.6(0.03)	2.9(0.03)
5.00	3.0(0.04)	2.3(0.06)	2.8(0.04)	3.0(0.04)
10.00	3.0(0.05)	2.5(0.07)	2.9(0.05)	3.1(0.05)
20.00	3.1(0.06)	2.6(0.09)	3.0(0.06)	3.2(0.05)
50.00	3.3(0.07)	2.8(0.11)	3.1(0.07)	3.3(0.07)

Station 6 (41.43N , 82.50W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	3.1(0.04)	2.6(0.05)	2.2(0.03)	3.1(0.04)
5.00	3.3(0.06)	2.8(0.07)	2.3(0.04)	3.3(0.06)
10.00	3.4(0.07)	3.0(0.09)	2.4(0.05)	3.5(0.07)
20.00	3.5(0.09)	3.2(0.10)	2.5(0.06)	3.6(0.08)
50.00	3.7(0.10)	3.4(0.12)	2.6(0.07)	3.8(0.10)

Station 7 (41.58N , 82.30W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	3.3(0.04)	2.9(0.05)	2.9(0.03)	3.4(0.04)
5.00	3.5(0.06)	3.1(0.07)	3.1(0.05)	3.6(0.06)
10.00	3.6(0.08)	3.3(0.09)	3.2(0.06)	3.7(0.07)
20.00	3.8(0.09)	3.5(0.11)	3.3(0.07)	3.8(0.08)
50.00	4.0(0.11)	3.7(0.13)	3.4(0.08)	4.0(0.10)

Station 8 (41.58N , 82.10W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	3.6(0.05)	2.9(0.05)	3.3(0.04)	3.7(0.04)
5.00	3.9(0.07)	3.1(0.07)	3.5(0.06)	3.9(0.06)
10.00	4.0(0.09)	3.3(0.09)	3.7(0.07)	4.1(0.08)
20.00	4.2(0.10)	3.5(0.11)	3.8(0.09)	4.2(0.09)

50.00	4.6(0.15)	3.8(0.11)	5.5(0.14)	5.5(0.14)

Station 18 (42.30N , 80.15W)

Return Period (yr)	Angle Class 1	2	3	All
2.00	3.5(0.05)	2.8(0.05)	4.8(0.07)	4.8(0.07)
5.00	3.7(0.07)	3.1(0.07)	5.1(0.09)	5.1(0.09)
10.00	3.9(0.09)	3.2(0.09)	5.3(0.11)	5.3(0.11)
20.00	4.0(0.11)	3.4(0.11)	5.5(0.13)	5.5(0.13)
50.00	4.3(0.13)	3.6(0.13)	5.8(0.16)	5.8(0.16)

Station 19 (42.30N , 79.97W)

Return Period (yr)	Angle Class 1	2	3	All
2.00	3.5(0.06)	2.8(0.06)	5.1(0.07)	5.1(0.07)
5.00	3.8(0.08)	3.1(0.08)	5.4(0.10)	5.4(0.10)
10.00	3.9(0.10)	3.3(0.10)	5.7(0.13)	5.7(0.13)
20.00	4.1(0.11)	3.5(0.12)	5.9(0.15)	5.9(0.15)
50.00	4.3(0.14)	3.7(0.14)	6.2(0.18)	6.2(0.18)

Station 20 (42.45N , 79.77W)

Return Period (yr)	Angle Class 1	2	3	All
2.00	3.0(0.05)	2.9(0.04)	5.3(0.08)	5.3(0.08)
5.00	3.2(0.08)	3.1(0.06)	5.6(0.11)	5.6(0.11)
10.00	3.4(0.09)	3.2(0.07)	5.9(0.13)	5.9(0.13)
20.00	3.6(0.11)	3.3(0.08)	6.1(0.15)	6.1(0.15)
50.00	3.8(0.13)	3.5(0.10)	6.4(0.18)	6.4(0.18)

Station 21 (42.45N , 79.57W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	2.8(0.05)	2.8(0.04)	5.1(0.06)	5.1(0.06)
5.00	3.0(0.07)	3.0(0.06)	5.3(0.09)	5.3(0.09)
10.00	3.2(0.08)	3.1(0.07)	5.6(0.11)	5.6(0.11)
20.00	3.3(0.10)	3.3(0.08)	5.8(0.13)	5.8(0.13)
50.00	3.5(0.12)	3.4(0.10)	6.0(0.15)	6.0(0.15)

Station 22 (42.58N , 79.37W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	2.4(0.04)	2.5(0.04)	4.8(0.07)	4.8(0.07)
5.00	2.6(0.06)	2.6(0.06)	5.1(0.09)	5.1(0.09)
10.00	2.7(0.07)	2.8(0.07)	5.3(0.11)	5.3(0.11)
20.00	2.8(0.09)	2.9(0.09)	5.6(0.13)	5.6(0.13)
50.00	3.0(0.11)	3.1(0.10)	5.8(0.16)	5.8(0.16)

Station 23 (42.58N , 79.18W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	2.3(0.04)	2.8(0.05)	4.4(0.05)	4.4(0.05)
5.00	2.5(0.06)	3.0(0.07)	4.6(0.07)	4.6(0.07)
10.00	2.7(0.07)	3.2(0.08)	4.8(0.09)	4.8(0.09)
20.00	2.8(0.09)	3.3(0.10)	5.0(0.11)	5.0(0.11)
50.00	3.0(0.10)	3.5(0.12)	5.2(0.13)	5.2(0.13)

Station 24 (42.73N , 78.98W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	1.8(0.03)	1.8(0.03)	4.3(0.05)	4.3(0.05)
5.00	1.9(0.05)	1.9(0.04)	4.5(0.06)	4.5(0.06)
10.00	2.0(0.06)	2.0(0.05)	4.7(0.08)	4.7(0.08)
20.00	2.2(0.07)	2.1(0.06)	4.8(0.09)	4.8(0.09)
50.00	2.3(0.08)	2.2(0.07)	5.0(0.11)	5.0(0.11)

Station 25 (42.73N , 79.18W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	5.0(0.06)	2.7(0.06)	2.0(0.03)	5.0(0.06)
5.00	5.3(0.08)	3.0(0.08)	2.1(0.04)	5.3(0.08)
10.00	5.4(0.10)	3.2(0.10)	2.2(0.05)	5.4(0.10)
20.00	5.6(0.12)	3.3(0.12)	2.3(0.06)	5.6(0.12)
50.00	5.9(0.14)	3.6(0.15)	2.4(0.08)	5.9(0.14)

Station 26 (42.73N , 79.37W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	5.1(0.06)	2.9(0.07)	2.3(0.04)	5.1(0.07)
5.00	5.3(0.09)	3.1(0.10)	2.5(0.06)	5.3(0.09)
10.00	5.5(0.11)	3.3(0.12)	2.6(0.07)	5.6(0.11)
20.00	5.7(0.13)	3.5(0.14)	2.7(0.08)	5.8(0.13)
50.00	6.0(0.16)	3.8(0.17)	2.9(0.10)	6.0(0.16)

Station 27 (42.73N , 79.57W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	4.8(0.06)	2.7(0.04)	2.3(0.04)	4.8(0.06)
5.00	5.0(0.09)	2.8(0.06)	2.5(0.05)	5.0(0.09)
10.00	5.2(0.11)	3.0(0.07)	2.6(0.06)	5.2(0.11)
20.00	5.4(0.13)	3.1(0.08)	2.7(0.07)	5.4(0.13)
50.00	5.7(0.15)	3.3(0.10)	2.8(0.09)	5.7(0.15)

Station 28 (42.73N , 79.77W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	5.0(0.08)	3.1(0.05)	2.4(0.04)	5.0(0.08)
5.00	5.3(0.10)	3.3(0.06)	2.6(0.05)	5.3(0.10)

50.00	2.5(0.05)	2.0(0.05)	2.1(0.05)	2.5(0.05)

Station 47 (41.87N , 83.27W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	1.7(0.02)	1.6(0.02)	1.6(0.02)	1.8(0.02)
5.00	1.8(0.03)	1.7(0.03)	1.7(0.02)	1.8(0.02)
10.00	1.8(0.03)	1.7(0.03)	1.8(0.03)	1.9(0.03)
20.00	1.9(0.04)	1.8(0.04)	1.8(0.03)	1.9(0.03)
50.00	2.0(0.05)	1.9(0.05)	1.9(0.04)	2.0(0.04)

Station 48 (41.87N , 81.90W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	3.6(0.05)	2.6(0.04)	4.2(0.06)	4.3(0.05)
5.00	3.8(0.07)	2.8(0.05)	4.5(0.08)	4.5(0.07)
10.00	4.0(0.08)	2.9(0.07)	4.7(0.10)	4.6(0.09)
20.00	4.1(0.10)	3.0(0.08)	4.8(0.11)	4.8(0.11)
50.00	4.3(0.12)	3.2(0.09)	5.1(0.14)	5.0(0.13)

Station 49 (42.15N , 81.13W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	3.0(0.04)	2.5(0.04)	4.4(0.05)	4.4(0.05)
5.00	3.2(0.05)	2.7(0.06)	4.6(0.07)	4.6(0.07)
10.00	3.3(0.06)	2.8(0.07)	4.7(0.09)	4.7(0.09)
20.00	3.4(0.08)	3.0(0.08)	4.9(0.10)	4.9(0.10)
50.00	3.6(0.09)	3.1(0.10)	5.1(0.12)	5.1(0.12)

Station 50 (42.30N , 80.35W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	3.1(0.04)	2.6(0.03)	4.1(0.05)	4.1(0.05)
5.00	3.3(0.06)	2.8(0.04)	4.3(0.07)	4.3(0.07)
10.00	3.4(0.07)	2.8(0.05)	4.5(0.08)	4.5(0.08)
20.00	3.5(0.08)	3.0(0.06)	4.6(0.10)	4.6(0.10)
50.00	3.7(0.10)	3.1(0.08)	4.8(0.12)	4.8(0.12)

Station 51 (42.58N , 79.57W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	2.5(0.05)	2.4(0.04)	4.9(0.07)	4.9(0.07)
5.00	2.7(0.06)	2.6(0.05)	5.2(0.09)	5.2(0.09)
10.00	2.8(0.08)	2.7(0.07)	5.4(0.11)	5.4(0.11)
20.00	3.0(0.09)	2.8(0.08)	5.6(0.14)	5.6(0.14)
50.00	3.2(0.11)	3.0(0.09)	5.9(0.16)	5.9(0.16)

Station 52 (41.87N , 82.30W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	3.1(0.04)	2.5(0.03)	3.2(0.03)	3.3(0.03)
5.00	3.3(0.05)	2.6(0.04)	3.3(0.05)	3.4(0.04)
10.00	3.4(0.07)	2.7(0.05)	3.5(0.06)	3.5(0.05)
20.00	3.5(0.08)	2.8(0.06)	3.6(0.07)	3.6(0.06)
50.00	3.7(0.09)	2.9(0.07)	3.7(0.08)	3.8(0.08)

Station 53 (41.73N , 82.30W)

Return Period (yr)	Angle Class			
	1	2	3	All
2.00	3.5(0.04)	2.5(0.05)	3.4(0.04)	3.6(0.04)
5.00	3.6(0.06)	2.7(0.07)	3.6(0.06)	3.8(0.05)
10.00	3.8(0.07)	2.8(0.09)	3.7(0.07)	3.9(0.07)
20.00	3.9(0.08)	3.0(0.10)	3.9(0.09)	4.0(0.08)
50.00	4.1(0.10)	3.2(0.12)	4.0(0.10)	4.2(0.09)
