This document makes use of international metric units according to the Systeme International d'Unites (SI). In certain cases, utility requires the retention of other systems of units in addition to the SI units. The conventional units stated in parentheses following the computed SI equivalents are the basis of the measurements and calculations reported.

OUTGASSING DATA FOR SPACECRAFT MATERIALS

William A. Campbell, Jr., Richard S. Marriott, and John J. Park
Goddard Space Flight Center

INTRODUCTION

This second compilation of outgassing data of materials for spacecraft use consists of data obtained utilizing equipment similar to that developed at Stanford Research Institute (SRI). The first compilation included data from Goddard Space Flight Center (GSFC) tests and from the SRI report (reference 1) for tests through December 31, 1972. The present compilation includes the prior data (reference 2) plus additional data through December 31, 1974. Thus, this compilation supersedes TN D-7362.

Stanford Research Institute personnel, under contract to the Jet Propulsion Laboratory (JPL), developed a system for determining the weight loss in vacuum and for collecting the volatile compounds. Their report, which contained results for the period from June 1964 to August 1967, served admirably as a foundation for selecting spacecraft materials with low outgassing properties. Based on the SRI data and on GSFC data, a GSFC report (reference 3) was published that included data for those materials which met two criteria: a maximum mass loss of 1.0 percent and a maximum of 0.10 percent condensable materials.

EQUIPMENT

The particular system used at GSFC for outgassing testing was developed at SRI for JPL. The equipment was designed to test microquantities, as opposed to large samples or macroquantities, and to collect outgassing molecules for identification.

A number of samples can be tested at one time in the vacuum system. Each sample, of about 100 to 300 milligrams mass, is placed into a preweighed aluminum foil boat which has been thoroughly cleaned and dried. Following a 24-hour preconditioning in 50 percent relative humidity atmosphere, to ensure that the samples receive a common preliminary treatment, the individual samples are weighed. The samples are then loaded into individual compartments in a solid copper bar which can be heated. Each compartment is closed by a solid copper cover, requiring that all volatile materials escape through a 0.63-cm (1/4-in.) diameter exit port only.

The copper heater bar, having 12 sample compartments, is heated to 398 K (125° C) for 24 hours. The sample, being heated by conduction and radiation, also is heated to 398 K (125° C). This heating causes the volatile materials to be driven off with their only escape being through the exit port. At a distance of 1.25 cm (1/2 in.), a chromium plated collector

plate is in the direct line of sight of the exit port and is maintained at 298 K (25° C). The molecules which condense at 298 K (25° C) or above in the particular vacuum environment will be collected. Barriers are near the collector plate to prevent cross-contamination from adjacent samples.

The mass loss of the sample is determined from the weights before and after the 398 K (125° C) exposure, and the percentage loss is calculated to provide the total mass loss (TML). In a similar manner, the difference between the weight of a clean collector and of a collector having condensed materials will provide the mass of condensables. This mass of condensables can be calculated as a percentage of the starting mass of the sample and is stated as collected volatile condensable materials (CVCVM).

DATA PRESENTATION

The data presented in sections A and B include both the GSFC data and those from the SRI 1967 Final Report (reference 1). A few materials included in these previous reports have been deleted to avoid duplication and to remove materials which are unavailable or otherwise unsuitable. The outgassing data are ordered differently in the two sections in order to be more usable for material selection. In section A, the selected materials are divided into 17 different categories of uses, such as adhesives, greases, paints, potting compounds, and so forth. In section B, all the selected materials contained in section A as well as other uncategorized materials are listed in alphabetical order by the manufacturer's identification for the materials.

These data are stored on computer tape for filing and reading. In the time interval between this compilation and the preceding TN D-7362 (reference 2), the data tapes were converted to be compatible with the Mark IV File Management System. The use of the Mark IV system will make it easier to add data for updating the tapes and to generate current output reports.

In this system, the computer has been instructed to follow a strict alphabetic and numerical order. This may at first seem confusing, particularly since the numbers are read from left to right, irrespective of the number of digits. For example, the order appears as DC11, DC142, DC2106, DC271, and DC3101. Similarly, the series of Scotchcast 200 materials is followed by Scotchcast 3 and 9. In the listing, letters have precedence over numbers; for example, MMM Tape Y-9360 will appear before MMM Tape 136.

All materials are listed only once in section A; there is no cross-indexing within either section A or section B. Thus, in looking for a specific material, one may start in section A under a possible use; if not found, one should consider another use of the material or look in section B under the specific manufacturer's identification of the material. Many materials have been tested, and the manufacturer's identification is the best clue in finding it, although often the name of the manufacturer may not be in the identification.

Section A

This section contains outgassing materials grouped in 17 categories according to their primary use, such as adhesives, conformal coatings, and marking materials. There are various types within the adhesive group, including film, conductive adhesives, and foam; the types are indicated wherever possible. Similarly, tapes include those which are mylar, vapor depositions on mylar, and aluminum sheet plus adhesive. This information is often stated in the description. However, certain materials can be used as adhesives and as potting compounds. In these instances, the material is listed in one category only, reflecting its most prevalent use.

In the printed data, the first column contains each material, listed by its manufacturer's identification followed by the mixture of components, if more than one component. The second column, "Code," contains a three-letter code for the manufacturers. (The appendix contains the manufacturers code list.) The outgassing data of TML and CVCN are in the next two columns, followed by three columns giving the particular curing time, temperature, and atmosphere for that particular sample. If the cure conditions are unknown, the columns are left blank. Some materials are cured or post-cured in two or more steps, which are carried out in the order listed. Some materials have been tested more than once and usually with different cures. The last column gives the application, as known.

Section B

In this section all the materials are listed in alphabetical order, as previously described, in the first column. The second column, "Data Reference," contains a reference number which indicates a GSFC test or an SRI test. The GSFC numbers are the sequentially designated test numbers, the higher numbers being more recent tests; the SRI numbers give page number (first 3 digits) and the material's order (last 2 digits) on that page, as reported in reference 1. The following columns contain the outgassing data as described for section A.

USE OF THE DATA

Whether one has a particular material in mind or not, section A, ordered by use, would be the first place to look. In the adhesives category, for example, there are 501 different test results—almost too many. Selection criteria of a maximum of 1.00 percent TML and a maximum 0.10 percent CVCN are suggested as a guide. One must consider his own experiment and the effect to others on the spacecraft in terms of potential outgassing products. Obviously, the lowest outgassing materials are the safest to select. These criteria are a starting point in materials selection, with other properties such as tensile strength, hardness, curing procedure, and possibly clarity also being considered.

Two component materials, often as A and B, are listed as A/B, and their relative amounts are also listed as a fraction, for example, 1/1, 100/73, and 50/50. These are mixed as parts by weight (BW) and sometimes by volume (BV). These may be cured at a specific temperature for a specific time; the temperatures are in degrees Celsius and the times can be minutes

(M), hours (H), or days (D). If no cure is listed, the cure data are not known, but one may presume that the manufacturer's directions for curing were followed. Also, the cures performed in vacuum are indicated by E-3 or E-6, referring to 0.13 N/m^2 or 0.00013 N/m^2 (10^{-3} or 10^{-6} torr), respectively.

Certain samples, particularly tapes and film adhesives, require specific treatment in testing. Some of the early tape samples were applied to a tubular screen (S), permitting the adhesive to be exposed to the vacuum, a technique no longer used. Tapes can be adhered to an aluminum ring (R), the adhesive being against the aluminum with outgassing occurring at the edges. Double sided tapes and transfer film adhesives are applied to preweighed aluminum foil (F) and covered with another piece of foil; this composite must be folded or cut into smaller pieces for loading into the boat, a procedure which permits outgassing at the edges.

Caution: The materials in this listing have been tested over a period of 10 and more years. There can be no assurance that variations in component materials have not occurred, with a resultant change in outgassing properties. The data should be used as a guide in selecting, with a fair degree of confidence (provided one uses the correct mixture, prepares the mixture properly, and cures the mixture as required), low outgassing materials for use on board spacecraft. Additionally, certain materials use MOCA (methylene-bis-ortho-chloroaniline) as a curing agent. Because the Department of Labor has included MOCA among the chemicals listed in an emergency temporary standard, certain precautions and cleanliness requirements must be followed when using it.

POSTMASTER: If Undeliverable (Section 158
Postal Manual) Do Not Return

"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."

—NATIONAL AERONAUTICS AND SPACE ACT OF 1958

NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons. Also includes conference proceedings with either limited or unlimited distribution.

CONTRACTOR REPORTS: Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities. Publications include final reports of major projects, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

TECHNOLOGY UTILIZATION PUBLICATIONS: Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Technology Surveys.

Details on the availability of these publications may be obtained from:
