13. Abstract:

2 of 3

The DOD Data Model is an integrated view of data requirements for the Functional Areas and Components in the Department of Defense (DOD). It represents, in accordance with the DOD Data Administration 8320 series standards, a view of each data requirement.

Standard data items are represented as entities (prime words), attributes (data elements), and relationships. These objects are represented in graphical format on entity relationship diagrams (Volumes 2-5). The details of these objects are found in the entity report (Volume 6), the attribute report (Volume 7). Enhancements since the 1-98 DDM are located in Volume 8.

Version 1-99 of the DOD Data Model represents the first update in fiscal year 1999 with a cut-off date of 30 Nov 1998 for all DOD Data Dictionary System (DDDS) information.

The DOD Data Model is an integrated view of logical data models from the functional areas.

Executive Summary

EXECUTIVE SUMMARY

The Defense Information Management Program requires accurate and consistent information expeditiously available to decision-makers to execute the Department of Defense (DoD) missions effectively. As information systems are planned, acquired, developed, and implemented from a DoD-wide perspective, they shall be based on a standard information model and use standard metadata. The DoD Data Model (DDM) is the infrastructure to support these objectives.

One of the major principles of the Defense Information Infrastructure (DII) initiative is the technical support of infrastructure and tools. An integral part of information infrastructure is the management of data through models, standards, dictionaries, and repositories. The DDM represents a consolidated view of the data models supporting the information infrastructures of the major functional areas and Services within the DoD.

Data is increasingly recognized as a major corporate asset which should be managed centrally to ensure its effective use. As the DoD continues to build, integrate, and consolidate the data models that reflect the corporate requirements captured in the DDM, it increases the accuracy, timeliness, integrity, and interoperability of the DII. It also ensures the interoperability of these systems via the Shared Data Environment (SHADE) by forming the basis of the logical data structure for the DoD information systems. These improvements will result in long-term savings for a Department faced with the challenges and fiscal constraints of implementing interoperable information systems.

The DDM is an integrated view of data models from some of the major functional areas which have been initial participants in data standardization.

*DoD Data Model contains almost 18,000 Approved Data Standards in the
1-99 version (November 30, 1998).*

The DDM is the result of integrating data model proposal packages which have been submitted through the formal data standardization process. All Functional and Component Data Administrators participated in the formal cross-functional review of these data standards.

The DDM is published on a semi-annual basis. Each version reflects the standard data requirements of the migration systems' transition to the standard environment; it also reflects requirements of new information systems developed in compliance with approved standards. The versions are based on the DoD fiscal year. Each version represents a snapshot of the DDM components as they evolve through the states of standardization.

The 1-99 version of the DDM represents the first update in fiscal year 1999, with a baseline date of 30 November 1998 for all Defense Data Dictionary System (DDDS) information. This version includes all approved and candidate entities and attributes which have entered the standardization process via proposal packages and which have been integrated into the DDM as of the baseline date.

The current version of the DDM represents 20 subject area views resulting from an architectural analysis of the data. As the model continues to grow, the number of subject area views may increase. The baseline was the 13 strategic subject area views established from the DoD Enterprise Model (11 January 1994). The seven additional subject area views represent the emerging strategic and operational data requirements of the DoD. Paper copies of all data models are available through the Defense Technical Information Center (DTIC). Electronic files (softcopy) of the DDM are available for file transfer from the DDDS Server. Views will be accessible on the internet at the DISA DoD Data Administration home page (<http://www-datadmn.itsi.disa.mil>). A notice of the release date will be placed in the DDDS Bulletin Board

Future versions of the DDM will continue to provide additional detailed information about DoD data standards. Based on technological improvements to commercial off-the-shelf software and computer-aided-software-engineering (CASE) tools, alternate methods will be used to improve the readability and usefulness of the DDM. One of the proposed DoD data management goals is to transition from the existing DDM and Functional and Component area data models to a functionally connected DoD Data Architecture. This would entail moving from a single, conceptual DDM in a single method/tool, IDEF1X/ERwin to an environment where Functional and Component data architectures are developed and maintained by the Principal Staff Assistants/Components in whatever method/tool they choose, as long as the data exchanged among systems/functions is classified as standard data.

The DoD 8320 series guidance, specifically the DoD 8320.1-M-1, Data Standardization Procedures, April 1998, defines the data standardization process. Changes to the current version of the DDM should be submitted in accordance with the above guidance.

Introduction

1.0 INTRODUCTION

The Defense Information Management Program requires accurate and consistent information expeditiously available to decision-makers to enable them to execute Department of Defense (DoD) missions effectively. As information systems are planned, acquired, developed, and implemented from a DoD-wide perspective, they shall be based on a model of information and use standard metadata. The DoD Data Model (DDM) is one component of the infrastructure to support these objectives. Figure 1 shows the relationship between data standards and information system databases.

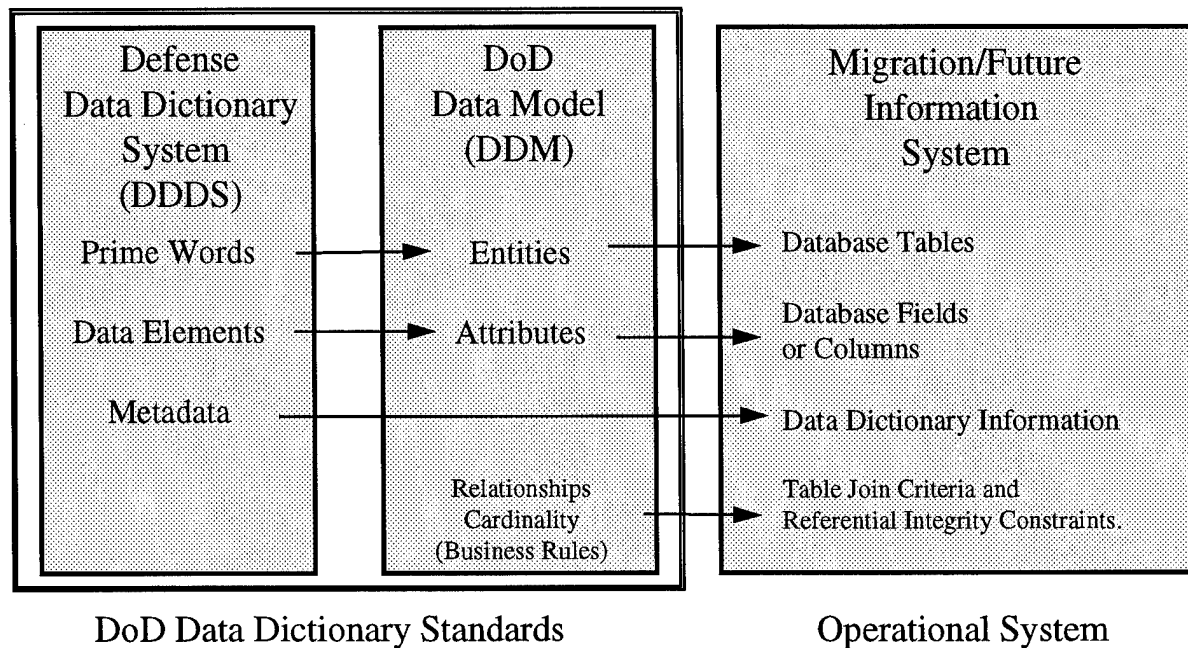

Figure 1. Relationship Of Data Standards To Their Information System Constructs.

The DDM is an integrated logical model of data requirements for all of DoD's Functional Areas and Components. It represents, in accordance with the DoD Data Administration 8320 series standards, a view of each data requirement. It serves as a communication medium to reconcile various references to the same data into a standard name, definition, format, and relationship for each data requirement.

The DoD Data Administration Program tracks all the entities (prime words) and attributes (data elements) that represent the evolving DoD standard information requirements. Part of the management responsibility includes tracking data model components in various states of standardization and integration.

With nearly 18,000 approved DoD data standards in the Defense Data Dictionary System (DDDS), the DoD Data Standardization initiative is entering a new phase. Data standardization is an important ongoing activity, but the focus is shifting to data standard validation with near-term implementation in mind. Quite often, data standards enhancements or extensions involve verifying the robustness of the current DDM. Factors important to data standards implementation are incorporated into the process to satisfy the stability and data exchange concerns of shared databases. The role of the DDM is to supply the community with snapshots of the evolving DoD logical data model. The DDM is available in views which are representations of the current standard data. These views, including the associated reports and cross-reference lists, are reference material for implementation and extension of the DDM. This

publication displays information not by process or organizational viewpoints, but from a closely-coupled data requirement perspective. Therefore, the DDM is a data reference document for locating DoD-wide accepted data standards for information requirements.

Standard data items are represented as entities, attributes, and relationships. These objects are represented in graphic format in data model views, also known as data maps or entity relationship diagrams (Section 3). The details of these objects are found in the following documents: the entity report (Section 5), the attribute report (Section 6), and the relationship report which describes the relationships among entities and their associated business rules (Section 7). The related data standard metadata is managed in the DDDS.

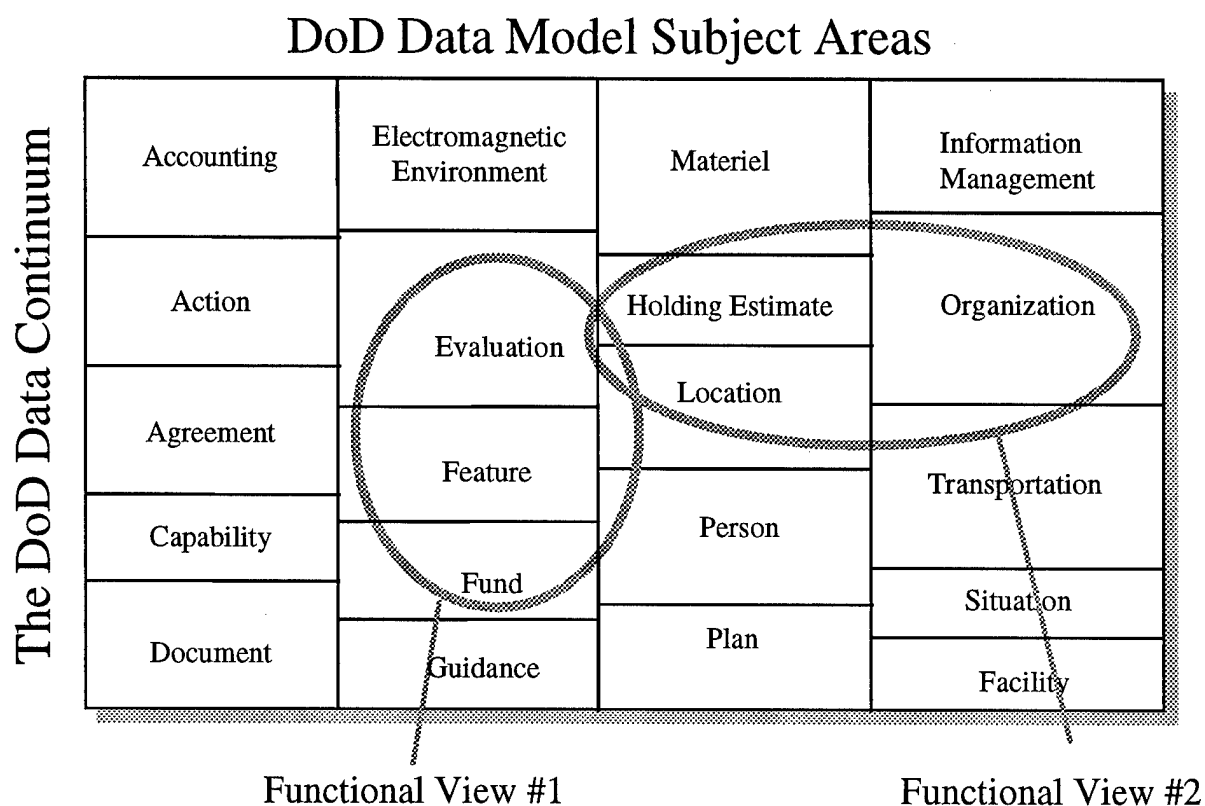

Figure 2. Integrated Views from Functional Areas

Extensions of the DDM are accepted based on reconciliation actions such as collaborative modeling sessions and focus sessions, reviews of data model proposal packages, and comments received from cross functional reviews. The DoD procedures to track data model components as they proceed through different states of acceptance are established in 8320.1-M-1, Data Standardization Procedures, April 1998. As a data model proposal moves through the review process, its entities and attributes move through the data standardization process. The stages of standardization, with the goal of implementing the data standards in DoD information systems, are the following:

Developmental	data requirements are evolving to meet the standards set for the DoD data;
Candidate	data from a proponent has met the criteria as required, and is submitted for formal cross-functional review to become new data standards;
Approved	data has been technically and functionally approved as standard;
Disapproved	data has been technically and/or functionally rejected;
Proposed for Archival	data is being analyzed to determine whether or not it should be archived;
Archived	data is no longer used for the DoD functional and component standard information system requirements.

Version 1-99 of the DDM represents the first update in fiscal year 1999, with a baseline date of 30 November 1998 for all DDDS information. The 1-99 Version of the DDM includes approved and candidate entities and data elements that have entered the standardization process via proposal packages as of the cut-off date, and have been integrated into the DDM.

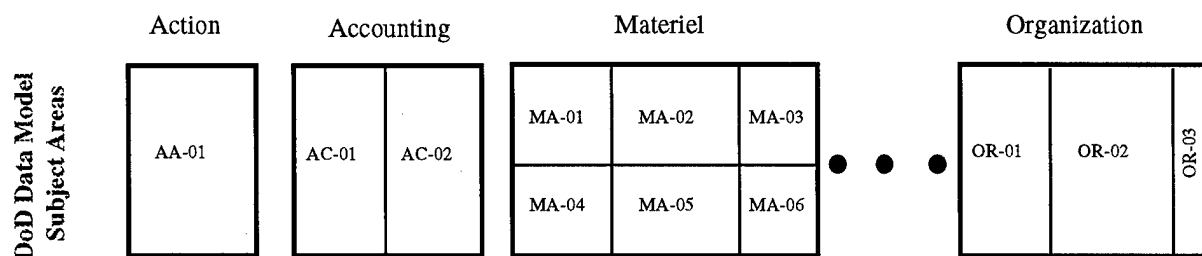

The DDM is an integrated view of data models from the functional areas, which have been participants in data standardization, as shown in Figure 2. This version of the DDM is composed of many functional area models, or portions of their models, which have been submitted for standardization in the form of data standardization proposal packages. All Functional and Component Data Administrators participated in the formal cross-functional review of these packages.

1.1 Subject Area Organization

The DDM document is organized into subject area folders. For ease of display in both soft and hard copy, each subject area is broken into several data maps. In order to provide the community with a more flexible mechanism of displaying and using the data maps, each data map is a view. Views are logical groupings of entities based on interaction of related entities and sizes of maps. Views no longer require an independent entity, although the model view could possibly stem from one.

The view approach is a simple and flexible method for grouping related data requirements. The size of the current views is more uniform, and in many cases, smaller across the fully-integrated model. While the independent entity view technique replicated associative entities across views to illustrate integration points, the current display format does not display most entities in more than one view. Integration points are still illustrated by key migration (symbolized by "FK") in each View. This approach reduces the number of displayed entities while retaining a fully integrated data model.

The DDM subject areas are comprised of a high-level collection of related groups of data requirements, as shown in Figure 3. Each subject area contains one or more views. The view format reduces the number of entities within DDM map displays to present smaller, more manageable, and portable data models.

Note:

1. Each View (V) name is a combination of the Subject Area abbreviation and an one up counter.
2. An entity may appear in multiple views if required to supply necessary detail to each view.
3. Each view belongs to one and only one Subject Area.

Figure 3. Subject Areas are comprised of View Data Maps

The view representation has no effect on the data element proposal package process or on data mapping requirements. Context entities still will be displayed in proposal packages of candidate data standards to show their placement and integration into the DDM. The view approach does not change the manner in which data requirements are captured, but it does modify the presentation of how the data requirements are displayed to enhance research into data standard reuse possibilities. In addition to facilitating implementation of data standards and creation of customized model views, migrating to smaller, more uniformly-sized views of the DDM allows us to use the World Wide Web (WWW) to distribute, display, and transfer files related to the DDM. Views in this document will be placed on the WWW. Any changes from the views presented in the DDM will be annotated as the views are placed on the WWW.

1.2 Document Organization

In addition to the Executive Summary and Introduction, this document consists of several major reports representing the integrated DDM. The reports provide graphic and narrative descriptions of the consolidated data requirements which have been submitted for cross-functional review up to 30 November 1998. The basic components displayed in this document are entities, attributes, and relationships.

SECTION 1: Entity To View To Subject Area Cross Reference Sorted By Entity.

This section contains a cross reference of every entity within the DDM, the views where the entity is represented, and the subject areas where the views reside. The list is sorted alphabetically by Entity Name.

SECTION 2: Entity To View To Subject Area Cross Reference Sorted By View.

This section contains a cross reference of every entity within the DDM, the views where it is represented, and the subject areas where the views reside. The list is sorted alphabetically by Subject Area name.

SECTION 3: Subject Area View IDEF1x Data Maps.

This section contains the entire DDM, broken out by subject area and view. The section is organized alphabetically by Subject Area. Within each Subject Area sub-section are the views which comprise that Subject Area. Each view corresponds to one data map.

SECTION 4: External Interface Standards.

The External Interface Standards Subject Area is captured in its own section. These data requirements reflect interfaces to the external community, not internal data requirements for DoD systems. The Electronic Commerce (EC) and Electronic Data Interchange (EDI) proposed standards which have been approved or are in candidate status by the cutoff date are represented in this section. These standards are mapped to the DoD functional community data standards (See Section 3) as required for electronic interchange with organizations external to the DoD.

SECTION 5: Entity Report.

This section contains all approved and candidate entities included in the DDM. For each entity, the following information is reported: associated attributes, the entity definition, the status, and the DDDS counter number.

SECTION 6: Attribute Report.

This section contains all approved and candidate attributes included in the DDM. For each attribute, the following information is reported: attribute definition, status, and the DDDS counter number.

SECTION 7: Entity Relationship Report.

This report contains all relationships managed within the DDM. All identifying, non-identifying, and subtype relationships are reported. Information includes the type of relationship, the cardinality and business rule name, plus parent and child entity data.

SECTION 8: DoD Data Model Enhancements.

This section contains all changes in status for approved and candidate entities and attributes from the 4-97 DDM, plus new entities and attributes and their respective statutes. The listing is by proposal package submission. The configuration management report shows the entire set of changes, which describe how the current DDM version is extended from the previous baseline.

SECTION 9: Functional Area Using Model Report.

The DDDS provides the DoD communities with the capability to associate prime word names with "Using Models". The Using Model construct allows functional areas to define a collection of prime words necessary to support ongoing data standardization efforts and implementation of standards. Via Using Models, a community can extract a "View" which can be the basis of a Logical Data Model for a new system implementation. Section 9 is a report of all currently defined Using Models in the DDDS. Included in the report is the Functional Area which defined the Using Model and all the approved and candidate prime words associated with the model. The report is sorted by Using Model Name.

Appendix A. IDEF1x Modeling Conventions.

This section explains the integrated definition language for data modeling as discussed in the Federal Information Processing Standards, and illustrates the components contained in a data map. It incorporates basic information regarding the iconography and semantics of the DDM.

Appendix B. Acronyms.

The section provides a consolidated list of acronyms and abbreviations used in the text of this document.

Appendix C. Reference Documents.

This section contains authoritative references to the policy documents that address DDM management and administration.

Appendix D. Obtaining Softcopy or Hardcopy of the DoD Data Model.

This appendix describes how to download softcopies of the DDM via the Burns server or the WWW, and how to obtain hardcopies from the Government Printing Office.

1.3 Potential Issues Related To Developmental And Candidate Data

The majority of the DDM data is either in approved or candidate status. However, some developmental data is displayed in the model to provide context. This technique is both understandable and unavoidable in a model of this magnitude. Nevertheless, it should be noted that the developmental and candidate data are only potential standards and may not be compliant with functional area using models until completion of formal review.

As an integral part of the iterative nature of data standardization, developmental data that is not compliant in certain areas should be viewed as "placeholders" for topics of future discussion and modeling. These issues may be functional and/or technical in nature, and may be identified and resolved by several methods.

Developmental data may not meet the functional requirements of the entire DoD community. The cross-functional issues will be identified by the functional community. This developmental data is distributed in formal review packages or distributed for discussion via collaborative modeling sessions and/or focus sessions. Once identified, the functional requirements will be resolved by the appropriate Functional Data Administrators (FDAs) and the DoD Data Administrator in accordance with DoD 8320.1-M-1, Data Standardization Procedures, April 1998. Data administrators may identify potential areas for future integration opportunities, and should coordinate those requirements with their fellow data administrators and the DoD Data Administrator.

The technical issues related to the 8320 series of guidance and/or the Federal Information Processing Standard (FIPS) 184, Information Modeling Conventions, will be identified by the Center for Standards as the developmental data approaches the formal standardization process. Technical issues related to developmental data will *not* be resolved unilaterally by the Center for Standards. While many of the technical considerations found in the DDM may be documented and available to customers, the issues may not have a final resolution until customers indicate they are ready to proceed with formal standardization. The Center for Standards will provide final technical considerations and recommendations to customers prior to approving the data. The appropriate vehicles for technical suggestions are formal technical reviews, or collaborative modeling and/or focus sessions. Developmental data, which is displayed in the DDM to provide context, is not required to conform to all program requirements.

When seeking solutions to functional and/or technical issues, a primary technique of data administration has been the identification and management of synonyms--a single data concept having many similar characteristics and different names. The resolution of synonyms requires involvement by both functional and technical experts, and provides several great benefits to a data administration program i.e., reduction in the number of data items to manage; the increase in the accuracy and integrity of databases; and the increase of interoperability among systems. Limited use of the analytical techniques for resolving homonyms may cause false results with respect to integration issues and may be resolved more appropriately through the identification and documentation of these homonyms.

1.4 Modifications To The DoD Data Model Subject Areas

As part of the continuous review of the usability of the DDM, many views from the previous version have been divided into more than one view to accommodate the WWW environment. We anticipate views to become more stable in future DDM updates.

1.5 Future Enhancements Planned For The DoD Data Model

Future versions of the DDM will continue to provide additional detailed information about DoD data standards. Based on technological improvements to commercial off-the-shelf software and computer-aided-software-engineering (CASE) tools, alternate methods will be used to improve the readability and usefulness of the DDM. In conjunction with this publication of DDM 1-99, the C2 Core Data Model has been produced on the ModelMart CASE tool server. Over a period of time, one of the DoD data management goals is to have functional area models replace the user views currently in the DDM. All models will have access to metadata which users may download directly for modeling.

Data maps and metadata reports will be available via the internet. Views will be accessible on the DISA DoD Data Administration home page (<http://www-datadmn.itsi.disa.mil>). A notice of their release on the WWW will be placed in the DDDS Bulletin Board.

As in the past, each new DDM will represent an up-to-date version of all the data captured through the standardization process, and will identify changes from the previous version. The most current information between versions may be found in the DDDS. Changes to this model are accommodated and outlined in the DoD 8320 series of guidance, specifically DoD 8320.1-M, March 1994. Any cross-functional issues identified through the review of this document are accommodated by: requests for modification or archival via the DDDS; submission of proposal packages with proposed changes; and, collaborative modeling or focus sessions.

1.6 Data Standardization Entering A New Phase

The initial phase of DoD Data Standardization was to identify and catalog data standards. With almost 18,000 approved data standards captured in the DDDS and represented in the DDM, the focus is moving towards implementation of the data standards. The rate of additional new standards will lessen, and more reuse of existing standards will occur. In addition, the representation of the data standards as tailored logical data models for migration systems will become more important. In support of the Shared Data Environment, the Data Standards Division is moving forward on new ways to support the community. The softcopy of these logical data models will contain the metadata necessary to generate specific Data Dictionary Language to support the creation of databases. Also, reference tables (domain values) will be made available to the community to assist in the population of databases with standard-based information.

1.7 Obtaining The DoD Data Model In Softcopy Form

The DDM is available in both hardcopy and softcopy, as described in Appendix D. The intent is to reduce production of hardcopy versions as the DDM becomes available on the WWW. Additional information concerning access, downloading of views, supporting reference documentation, and metadata will be provided on the DISA Web page as described in paragraph 1.5.

An electronic version of the entire DDM in the 1-99 format is on the DISA DoD Data Administration home page (<http://www-datadmn.itsi.disa.mil>). A notice of their release on the WWW will be placed in the DDDS Bulletin Board. FTP access is also provided from the Burns server as multiple softcopy files. Access to this server is based on authorized user identification codes and passwords. The DDM files are obtained by using the menu-driven screens in conjunction with File Transfer Protocol (FTP) software. See Appendix D for detailed instructions.

Additional hardcopy versions of the DDM are available through the Defense Technical Information Center (DTIC) (800) 225-3842.

1.8 DoD Data Model Version 1-99 Entity Name Abbreviations

NOTE: The ERwin display tool limits an entity name to a length of 64 characters; therefore abbreviated names are listed below. The names are paired; the first name is the DDDS Prime Word name and the second is the abbreviated name that appears in the data map.

1.0 INTRODUCTION

Section one presents a cross reference report of entity names by View and Subject Area. For any given entity in the DDM, the Subject Area(s), and the specific View(s) in which the entity appears can be determined. Section One is sorted alphabetically by Entity Name. Entity names appear as they exist in the DDDS table of Prime Words.

1.0 INTRODUCTION

Section Two presents a cross reference report of entity names by Subject Area and View sorted alphabetically by Subject Area Name. For any given entity in the DDM, the Subject Area(s), and the specific View(s) in which the entity appears can be determined. Entity names appear as they exist in the DDDS table of Prime Words.

Section 2 V1 FY99 View Entities Sorted by Subject Area
