ABSTRACT

The Naval Blood Research Laboratory, Boston, MA, inspected solutions produced by the EDM REFLUPS system contained in overwrapped plastic bags and stored in a temperature- and humidity-controlled environment for 8 months to 2.3 years. The presence of mold, breakage and leaks was evaluated, and fluid volumes were measured. Lactated Ringer's solution, sodium chloride solution, and red cell wash solution were manufactured at four locations: Naval Ocean Systems Command, San Diego, CA, aboard the USS WASP, US Army Test Site, Fort Sam Houston, San Antonio, TX, and the Naval Blood Research Laboratory, Boston, MA. Of the 7068 bags inspected, 346, or 4.9% had mold present, and in 55 of these bags, the mold was located at the ports. It was noted that the ports were loose on several of the bags. The incidence of mold was found to be related to the site of production and, therefore, to the conditions under which the solutions were produced. Moisture was present beneath the overwrap in 0.6% of the bags, and identified as a leak in slightly less than half of these bags. The fluid volumes in the bags without overwraps averaged 10 ml lower than the bags with overwraps, indicating leakage into the space between the bag and overwrap.

Our findings indicate that the potential for contamination during application of the overwrap is a problem that must be resolved at the production site and the integrity of the bag ports must be ensured.

INTRODUCTION

The EDM REFLUPS system was designed to produce sterile, pyrogen-free solutions at the site of need, reducing the cost of transporting commercially-produced solutions (1).

Solutions produced by this system initially were found to be sterile and pyrogen-free, with chemical compositions equivalent to those of commercial solutions. However, during the initial inspection period, loose ports were observed in a small number of the overwrapped bags and mold (Aspergillus) was observed on the outside of three bags.

The overwrapped bags were then stored in a temperature (60-65 F) and humidity (50-55%) controlled environment for 8 months to 2.3 years and reinspected. The bags were weighed with and without overwraps to determine fluid volumes, and inspected for mold, breakage, and for the presence of leaks between the bags and overwraps.

OBJECTIVE

This study was done to assess the effects of storage of solutions produced by the EDM REFLUPS system. The overwrapped plastic bags containing the solutions were inspected for mold, breakage, and leaks, and fluid volumes were measured with and without the overwrap following storage for as long as 2.3 years.

METHODS

Solutions were produced by the EDM REFLUPS system between April 1992 and October 1993 at four sites:

1. **Naval Ocean Systems Command, San Diego, CA (NOSC)**
2. **USS Wasp (WASP)**
3. **Fort Sam Houston, San Antonio, TX (ARMY1 AND ARMY 2)**
4. **Naval Blood Research Laboratory, Boston, MA (NBRL)**

Solutions from NOSC, the USS WASP, and the ARMY were shipped to the Naval Blood Research Laboratory under controlled temperature conditions. The solutions produced by the four production sites were inventoried, sampled, and stored in a temperature (60-65 F) and humidity (50-55%) controlled environment for up to 2.3 years. The final inspection of the solutions was conducted from June-August 1994 on 7068 overwrapped plastic bags containing the following solutions:

Lactated Ringers 1 liter (LR1000)	**= 3236 bags**
Lactated Ringers 0.5 liter (LR500)	**= 2533 bags**
0.9% Sodium Chloride (NaCl)	**= 1115 bags**
0.9% Sodium Chloride 0.2% Dextrose Red Cell Wash (RCW)	**= 184 bags**
TOTAL:	**7068 bags**

After storage for 8 months to 2.3 years, the bags and overwraps were re-inspected for mold, breakage and the presence of moisture. The solution volumes were measured with and without the overwrap to assess loss of fluid from the bag into the space between the overwrap and the bag. A total of 7068 bags were inspected for the presence of mold, breakage and moisture. When moisture was present, the bag was allowed to air-dry and if dry solids remained on the surface, the source of the moisture was recorded as a leak.

Fluid volume was measured in 5501 overwrapped bags and in 3563 bags from which the overwrap had been removed. The volume of solution was determined by weighing the overwrapped bag, deducting the weight of the overwrap and bag, and then dividing this weight by the density of the solution. The volume of solution in the bag without an overwrap was determined by weighing the bag, deducting the weight of the bag, and dividing the weight by the density.

0.9% Sodium Chloride = 1.0036 g/ml

Lactated Ringers = 1.0033 g/ml

0.9% Sodium Chloride 0.2% dextrose = 1.0045 g/ml

Fill volume specifications were those provided to NBRL by Sterimatics Corporation, Bedford, MA, for stored product, as follows:

500-560 ml for 1/2 liter manifolds

1000-1090 ml for 1 liter manifolds

3000-3180 ml for 3 liter manifolds

Any bag weight outside the above range was considered a product failure and was labeled as either "high" or "low" (Appendices). Aluminum overwraps were used for some of the 1/2 liter lactated Ringer's solutions, otherwise plastic overwraps were used.

The overwrap weight was calculated by deducting the weight of an unwrapped bag from the weight of an overwrapped bag. If the difference exceeded the known weight of the overwrap, the increased weight was attributed to moisture collected between the overwrap and the bag.

RESULTS

Summary results obtained on the solutions following storage are reported in Tables 1 to 12. Individual listings of the bags are contained in the appendixes: 1.1.1 through 1.5.4 report inspection for mold and moisture and 2.1.1 through 2.5.4 report the fluid volumes.

Table 1 reports the duration of storage of the products from each of the four production sites. The Army produced solutions on two occasions: the first group was stored for 1.5 to 2 years and the second group for 8 to 11 months.

The number of bags inspected for mold and moisture is reported in Table 2. Of the 7068 bags inspected, 3236 contained 1 liter of lactated Ringers solution, 2533 contained 500 ml of lactated Ringers solution, 1115 contained sodium chloride, and 184 contained red cell wash solution. One hundred bags were produced by NOSC, 1065 by the USS Wasp, 1663 by NBRL, and 2424 by the Army on one occasion and 1816 on the second occasion.

The number of bags with mold present is reported in Table 3. Mold was found on 346 (4.9%) of the 7068 bags inspected.

The percentages of bags with mold present are reported in Table 4. The average incidence of mold was 4.9%, and was similar for the four types of solutions, ranging from 2.7% to 5.4%. The incidence of mold in the bags at the various sites of production ranged from 0.6% to 24%. The 100 bags of solution prepared by NOSC had, by far, the highest incidence of mold at 24%. The

incidence of mold in the first solutions produced by the Army (ARMY 1) and stored for 1.5 to 2 years (5.6%) was similar to that for solutions produced by the Army on a second occasion (ARMY 2) and stored for only 8 to 11 months (7.9%). Solutions produced by the NBRL had a 2.2% incidence of mold, and solutions produced aboard the USS Wasp had the lowest incidence of mold at 0.6%.

The percentages of bags with moisture present are reported in Table 5. The average incidence of moisture detection was 0.6%, much lower than the incidence of mold observed. However, the presence of moisture followed the same pattern as that of mold, with NOSC products the highest at 3%, followed by products from the Army at 0.7% and 0.9%, with NBRL and the USS Wasp lowest at 0.2%.

Table 6 describes the 38 bags where moisture was present between the bag and the overwrap. Eighteen of these (47%) were determined to have leaks.

The distribution of overwrapped bags of solution in which volumes were measured is described in Table 7. Of the total of 5501 bags, 2692 contained 1 liter of lactated Ringers solution, 1997 contained 500 ml of lactated Ringers solution, 655 contained sodium chloride, and 157 contained red cell wash solution. One hundred bags were produced by NOSC, 997 by the USS Wasp, 1340 by NBRL, and 1958 by the Army on the first occasion and 1106 on the second occasion.

Table 8 reports the distribution of the 3563 bags of solution without overwraps in which volumes were measured: 2114

contained 1 liter of lactated Ringers solution, 1378 contained 500 ml of lactated Ringers solution, and 71 contained red cell wash solution. One hundred bags were produced by NOSC, 862 by the USS Wasp, 890 by NBRL, and 1473 by the Army on one occasion and 238 on a second occasion.

Table 9 reports that an average of 2.2% of the overwrapped bags contained less than an acceptable volume. All of the bags of solution produced at NOSC were in the passing range; 4% of the NBRL products failed, 2.7% and 0.3% of the Army products failed, and 0.5% of the USS Wasp products failed.

Table 10 reports the percentage of failures when the bags were weighed without the overwraps. The average percentage of bags with lower than acceptable volumes was greater (3.5%) in the bags without overwraps. This observation can be explained by loss of fluid into the space between the bag and the overwrap.

The mean volumes of the solutions in bags with and without overwraps are reported in Tables 11 and 12. The 1 liter lactated Ringers solution was 1022 ml in the overwrapped bags and 1011 ml in the unwrapped bags; the 500 ml lactated Ringers solution was 517 ml in the overwrapped bags and 508 ml in the unwrapped bags; the red cell wash solution was the same (3053 ml) in the overwrapped and unwrapped bags. Overwrapped bags of sodium chloride contained a mean volume of 1026 ml; there were no unwrapped bags of sodium chloride solution weighed.

Location of mold

Of the 346 bags with mold present, 55 were described as having mold located at the port, 5 had mold on the label, and 285 had mold that was not confined or concentrated in any one area.

DISCUSSION

A total of 7068 bags were inspected for mold, breakage and the presence of moisture between the overwrap and bag. The volumes in the solution bags were measured with and without the overwrap to assess loss of fluid from the bag into the space between the overwrap and the bag.

The growth of mold has been reported in our earlier evaluation of solutions produced by the Army at Fort Sam Houston and stored for 3 months. The mold was identified as Aspergillus. In the current inspection, the percentage of bags with mold present was 4.9 for the 7068 bags inspected after 8 months to 2.3 years of storage. Mold was detected in products from all four sites. Since the incidence rate was related to the site of production, the presence of mold appeared to be due to the conditions under which the solutions were produced.

The occurrence of mold was not related to extended storage since the incidence was no greater in bags stored for 2 years than in those stored for 8 months.

Leakage from the bags was responsible for 47% of the cases in which moisture was observed between the bag and overwrap. Moisture was documented in 0.6% of the overwrapped bags, with the highest incidence in products from those sites with the greatest occurrence of mold, suggesting that the growth of mold was, in part, due to leaks and moisture.

Fluid volumes were slightly higher in the bags with overwraps than in the bags without overwraps, and the number of failures identified by reduced volume was greater in the bags without overwraps which reflected the leakage between the bag and the overwrap.

The mold was located on the outside of the bags, between the bag and the overwrap, often at the port. On rare occasions, mold was observed in the solution itself, near the port. Since the ports have been described in earlier reports as being loose and defective on occasion, the leakage and growth of mold reported in this final report may be associated with the defective ports on some of the bags.

These findings demonstrate that the production of solution by the EDM REFLUPS system must be carried out under conditions which limit the potential for introduction of spores and other airborne contaminants. In addition, the integrity of the bag ports must be ensured. Further, it is necessary to establish a dating period and conditions for storage.

The data in this report identify the potential for contamination of the external surface of the plastic bag containing the solution during overwrapping of the plastic bag. Methods to decontaminate the external surface of the plastic bag at the time the overwrap is applied should be investigated. A "functionally clean environment" for preparation of the REFLUPS solution is another approach to eliminate the possibility of

external contamination. A third approach is to have plastic tubing attached to the plastic bag which would permit sterile docking of the plastic bag to the infusion set used to deliver the solution from the plastic bag into the recipient or to the cell washer.

This final report identifies a fundamental technical problem, external contamination of the plastic bag during application of the overwrap, during the preparation of sterile, pyrogen-free solution using the EDM REFLUPS system. Resolution of this problem would assist in the preparation of sterile, pyrogen-free solution at the site of need by the Department of Defense.
