Report Title

SEMICONDUCTOR-BASED NANOTECHNOLOGY APPLICATIONS : FINAL REPORT

ABSTRACT

This project was based on the PI's research during 2005-2010 as part of a NSF-CAREER award, on the ferromagnetic properties of pure and transition metal doped oxide semiconductors such as SnO₂, ZnO, and CeO₂, reported in 40 refereed research papers. In this ARO project, studies on ultra small particles of these oxides with crystallite sizes of 2-5nm have shown room temperature ferromagnetism in undoped samples. Interestingly, in oxide nanoparticles doped with transition metal ions such as Fe and Co, the magnetic moment per dopant ion decreased with increasing their concentration, thus suggesting that the magnetic properties are not arising from the dopant ions. The observed magnetic moment in these materials scales with oxygen defect concentration determined from catalytic studies, thus indicating the major role of oxygen defects in the magnetic properties of nanoscale oxide semiconductors. Magnetic Properties of Fe doped, Co Doped and Fe+Co co-doped ZnO nanoparticles showed that charge transfer between co-doped metal ions contributes to ferromagnetism. Thin film structures using Co doped SnO₂ were fabricated and studied their usefulness in device applications. NP of semiconducting oxides such as ZnO were also used to investigate their cytotoxicity and preferential cancer cell killing in several types of human cells.

(c) Presentations

1. A simple route to A simple aqueous solution route to ultrasmall SnO₂ nanoparticles, Gordon Alanko and Alex Punnoose, Poster presentation at the Materials Science and Technology conference, Pittsburgh, October 2011.
2. J. Beltran, J. Osorio, C. Barrero and A. Punnoose, Magnetic Properties of Fe doped, Co Doped and Fe+Co co-doped ZnO Accepted for presentation in the 57th Magnetism and Magnetic Materials conference (AIP), Chicago, January 2012,
3. Zebrafish xenograft model of glioblastoma to investigate structure activity relationships of zinc oxide nanoparticles with anticancer properties, Leah C. Wehmas, Lisa Truong, Jeffrey A. Greenwood, Alex Punnoose, & Robert L. Tanguay, First Sustainable Nanotechnology Organization Conference, November 4-6, 2012 at the Hilton Arlington, VA
4. Selective toxicity of zinc oxide nanoparticles to cancer cells, Invited talk, Alex Punnoose, Department of Biophysics and Biochemistry, Oregon State University, May 9, 2012.
5. Size, Surface Structure and Doping Effects on Ferromagnetism in SnO₂. Gordon Alanko**, Aaron Thurber, Charles Hanna and Alex Punnoose. 56th Magnetism and Magnetic Materials conference (AIP), October 30–November 3, 2011, Scottsdale, Arizona.
6. Highly shape-selective synthesis, silica coating, self-assembly, and magnetic stability of hematite nanoparticles. Jianhui Zhang, Aaron Thurber, Charles Hanna and Alex Punnoose. 56th Magnetism and Magnetic Materials conference (AIP), October 30–November 3, 2011, Scottsdale, Arizona.
7. Ferromagnetic properties of Fe doped CeO₂ nanoparticles. G. L. Beausoleil**, G. Alanko**, Charles Hanna, S. Srinivasa Rao and Alex Punnoose, 56th Magnetism and Magnetic Materials conference (AIP), October 30–November 3, 2011, Scottsdale, Arizona
8. Unusual crystallite expansion and modification of ferromagnetism due to aging in pure and doped ZnO nanoparticles. Aaron P. Thurber, Kelsey N. Dodge**, Gordon Alanko**, Geoffrey L. Beausoleil II**, Charles Hanna and Alex Punnoose. 56th Magnetism and Magnetic Materials conference (AIP), October 30–November 3, 2011, Scottsdale, Arizona.
9. Synthesis and Characterization of Transition Metal-doped ZnO; Lytia A. Smith**, Theron R. Fereday**, Jerry D. Harris, Jason Brotherton**, Aaron Thurber, William B. Knowlton, Alex Punnoose and Brian J. Frost, poster presentation at the Spring 2010 National Meeting of the American Chemical Society (San Francisco, California, March 21 - 25, 2010).
10. Magnetism of ZnO Nanoparticles: Dependence on crystallite size and surfactant coating ,Aaron P. Thurber, Geoffrey L. Beausoleil II**, Gordon A. Alanko**, Joshua J. Anghel**, Michael S. Jones**, Lydia M. Johnson*, Jianhui Zhang, C. B. Hanna, D. A. Tenne, and Alex Punnoose, 55th Magnetism and Magnetic Materials conference (AIP) in Atlanta, November 2010.
11. An EPR study of CeO₂ nanoparticles: Effect of doping with 5% Co or Ni ions and varying annealing temperature, S. K. Misra, S. I. Andronenko, J. D. Harris, A. Thurber, G. L. Beausoleil II** and A. Punnoose, 55th Magnetism and Magnetic Materials conference (AIP) in Atlanta, November 2010.
12. Synthesis and Characterization of ZnO Sol-gel Powders; Amanda R. Snyder**, Lytia A. Smith**, Theron R. Fereday**, Jerry D. Harris, Aaron Thurber, Jason Brotherton, Pamela Walker, William B. Knowlton, and Alex Punnoose, poster presentation at the Spring 2010 National Meeting of the American Chemical Society (San Francisco, California, March 21 - 25, 2010).
13. Growth and Characterization of ZnO Thin Films; Theron Fereday**, Lytia Smith**, Amanda Snyder**, Jerry D. Harris, Aaron Thurber, Jason Brotherton**, William B. Knowlton, Alex Punnoose, Seth M. Hubbard, and Brian J. Frost, poster presentation at the Spring 2010 National Meeting of the American Chemical Society (San Francisco, California, March 21 - 25, 2010).

Awards

? Alex Punnoose was awarded the Boise State University Distinguished Professorship, most prestigious honor that can be accorded to a faculty member to recognize excellence in teaching, research and public service (one of the seven Boise State University Distinguished Professors selected from 535 faculty members, by a university-wide committee, see <http://news.boisestate.edu/update/2011/04/30/boise-state-names-six-faculty-as-inaugural-%E2%80%9998distinguished-professors%E2%80%9999/>)

? Alex Punnoose received the 2012 Jean'ne Shreeve Research Excellence Award from Idaho NSF-EPSCoR, established to recognize the accomplishments of a faculty member at Boise State University, Idaho State University, the University of Idaho or other state institution of higher education who has previously been an active participant in the NSF EPSCoR program.

? Alex Punnoose was a Finalist of the 2010 Idaho Innovation Award in the Early-Stage innovation category organized by the Idaho Technology council in 2010 for the research discovery (U.S. Patent No. 8,187,638) titled "Novel Nanoparticles That Kill Cancer Cells" (<http://news.boisestate.edu/update/2010/10/28/researchers-honored-at-2010-idaho-innovation-awards/>)

Scientific Progress

Our recent experiments on pure and transition metal doped oxide semiconductors such as SnO₂, ZnO and CeO₂ clearly demonstrated that room-temperature ferromagnetism can be produced in these systems. There is a strong role for the transition metal dopants, but their magnetic moment is not directly contributing to the magnetism or exchange interaction. Magnetism in these materials are related to oxygen vacancies and defects. Efforts are on to increase and control defects and the room temperature ferromagnetism. Ferromagnetism in these oxide nanoparticles depends strongly on their surface structure. Modifying the surface structure of oxide nanoparticles, we have recently shown that both magnetic and photoluminescence properties can be tailored.

ZnO nanoparticles display strong cytotoxicity to certain bacterial systems and human cells. Our combined experimental and theoretical modeling studies demonstrated that electrostatic interactions between the charged ZnO nanoparticles and the bacterial cells play a major role in the cytotoxic response. In human cells, however, both electrostatics and reactive oxygen species play major roles in the observed cytotoxicity.

A new method to detect hydrogen gas by monitoring the changes in the magnetic properties of hematite nanoparticles has been developed.

When prepared in nanoscale size range, most semiconductor oxides including ZnO, SnO₂ and TiO₂ show strong photocatalysis due to their large surface to volume ratio and the presence of oxygen vacancies and defects. When these nanoparticles are doped with transition metals, the electron-hole recombination rate can be controlled well and also their photocatalytic activity.
