DevSecOps: Modern Software Engineering Practices and Tools that Encompass the Full Software Lifecycle

DevSecOps is a cultural and **engineering practice** that breaks down barriers and opens **collaboration between development, security, and operations** organizations **using automation** to focus on rapid, frequent delivery of secure infrastructure and software to production. It encompasses intake to release of software and manages those flows predictably, transparently, and with minimal human intervention/effort [1].

A **DevSecOps Pipeline** attempts to seamlessly integrate "three traditional factions that sometimes have opposing interests:

- development; which values features;
- security, which values defensibility; and
- operations, which values stability [2]."

Not only does one need to balance the factions. They must do so in a way that balances **risk**, **quality** and **benefits** within their **time**, **scope**, and **cost** constraints.

 DevSecOps Guide: Standard DevSecOps Platform Framework U.S. General Services Administration. https://tech.gsa.gov/guides/dev_sec_ops_guide. Accessed 17 May 2021
 DevSecOps Platform Independent Model, https://cmu-sei.github.io/DevSecOps-Model/ Carnegie Mellon

An Enterprise View

All DevSecOps-oriented enterprises are driven by three concerns:

- **Business Mission** captures stakeholder needs and channels the whole enterprise in meeting those needs. It answer the questions *Why* and *For Whom* the enterprise exists
- Capability to Deliver Value covers the people, processes, and technology necessary to build, deploy, and operate the enterprise's products
- Products the units of value delivered by the organization. Products utilize the capabilities delivered by the software factory and operational environments.

Challenge: Cybersecurity of Pipeline and Product

The tight integration of Business Mission, Capability Delivery, and Products, using integrated processes, tools, and people, increases the attack surface of the product under development.

Managing and monitoring all the various parts to ensure the product is built with sufficient cybersecurity and the pipeline is maintained to operate with sufficient cybersecurity is complex.

How do you focus attention to areas of greatest concern for security risks and identify the attack opportunities that could require additional mitigations?

Carnegie Mellon

Security and Privacy Institute

DevSecOps Platform Independent Model (PIM)

 is an authoritative reference to fully design and execute an integrated Agile and DevSecOps strategy in which all stakeholder needs are addressed

Carnegie Mellon University Security and Privacy Institute

Mellor

- enables organizations to implement DevSecOps in a secure, safe, and sustainable way in order to fully reap the benefits of flexibility and speed available from implementing DevSecOps principles, practices, and tools
- was developed to outline the activities necessary to consciously and predictably evolve the pipeline, while providing a formal approach and methodology to building a secure pipeline tailored to an organization's specific requirements

DevSecOps Requirements

Example of Requirements Representation in Diagrams from PIM

All requirements are organized into categories based on logical and functional groupings:

- Governance
- Requirements
- Architecture and Design
- Development
- Test
- Delivery
- System Infrastructure

9

DevSecOps Capability/Strategic Viewpoint

A capability is a high-level concept that describes the ability of a system to achieve or perform a task or a mission.

All requirements in the DevSecOps PIM were allocated to corresponding capabilities.

DevSecOps Operational Viewpoints

An operational model for a system describes behavior of the system to conduct enterprise operations. The main operational processes for DevSecOps includes development process for the product, as well as the DevSecOps process itself.

Summary

SyLab Carnegie Mellon University Security and Privacy Institute

Carnegie Mellon University Software Engineering Institute

The use of model based systems engineering in the design, implementation, and sustainment of your DevSecOps socio-technical system will assist you in building a system that is:

- Trustworthy No exploitable vulnerabilities exist, either maliciously or unintentionally inserted.
- Predictable When executed, software functions as intended and only as intended.
- Timely Features are delivered as the speed of relevance.
